NEW STREET SQUARE

PREFACE

In this Encyclopædia are included all the indigenous, cultivated, and exotic plants which are now found in, or have been introduced into, Britain. The object of the work is to give a natural history of these plants, accompanied by such descriptions, engraved figures, and elementary details, as shall enable a beginner, who is a mere English reader, to discover the name of any plant which he may find in flower, refer it to its proper place, both in the Natural and Artificial Systems of Classification, and acquire all the information respecting it which is useful or interesting. It must be evident to all who are conversant with the present state of botany, and who know the number of plants which have been introduced into Britain, that to accomplish such an object within the limits of a volume is a task of no ordinary difficulty; some explanation of the manner in which it has been executed may therefore be required.

The Work is divided into Two Parts. The First Part (p. [1]) contains the Linnean or Artificial Arrangement of all the genera and species, with all the details comprehended in botanical description and natural and artificial botanical history, and with engraved portraits of one or more species of each genus. The Second Part (p. 1051.) contains the Jussieuean or Natural Arrangement of all the genera, without repetition of the species or any details connected with them: but as the names of the natural orders are added after each genus in the Artificial System, and as each genus in both arrangements is numbered, a direct reference may be had from the second arrangement to the first, and from the first to the second; reference may also be had indirectly, through the medium of the Contents and Index.

An Introduction is given to each system of arrangement (p. [1.] & 1051.), and a General Introduction to the whole work (p. xix.), in which its uses are explained. When the beginner has a plant in flower and would ascertain its name, he will turn to the Linnean System, as explained in the Introduction to that system (p. [1.]); and, when he has but a small part of any plant, he will turn to the Natural System, as directed in the General Introduction (p. xix.).

All the Technical Terms, or words not usually found in an English dictionary, are explained in the Glossary (p. 1094.); and engravings are given of such of the objects designated as might occasion any difficulty to a beginner. This Glossary and the two Introductions (p. [1.] & 1051.) form together a complete Grammar of Botany.

The Table of Synonymes in various languages (p. 1108.) may, to a certain extent, be considered as presenting the Popular Floras of the various countries where these names are used; since it is only to the remarkable plants of a country that vernacular names are given.

The signs used for the habits of plants (column 3.), and their duration in the garden (col. 4.), are improvements in botanical description by the Editor*, now applied for the first time. The twenty-three varieties of habit are indicated by figures of the plants themselves; as a grass for a grass, a bulb for a bulb, a plant floating on water for an aquatic, &c., &c., to recollect which requires no exertion of memory. A perennial is indicated by a triangle, instead of the old sign, ♃; an annual remains a circle as before, ○, because, among other reasons, gardeners sow patches of annual flowers in circles; and a biennial is a double circle, ◎, instead of the old sign, ♂. The bark stove is a square, □; the dry stove three sides of a square, ⊐; the green-house two and a half sides of a square, ⌴; and the frame two sides of a square, ⌴; because these forms, if supposed to indicate the sections of plant-houses enclosed by glazed sashes, as actually built, will represent the different structures which are meant to be indicated. By combining the signs of duration with habitation, ⧈ ⧊ ◫ ◍, &c. &c., much room is saved in abridged botanical description. Thus, in consequence of the single innovation of the triangle and the

NEW IMPRESSION.

LONDON:

LONGMANS, GREEN, AND CO.

1866.

square, we have simplified and extended the power of indicating the habits and habitations of plants by signs from ten, the usual number in the most complete botanical catalogues, to forty, the number employed in this work.

No farther explanation of the nature and uses of this work appearing necessary, it only remains to present the thanks of the Proprietors and of the Editor to AYLMER BOURKE LAMBERT, Esq., F.R.S. V.P.L.S. F.G.S. &c., for allowing Mr. SOWERBY the freest use of his rich botanical library and extensive herbarium, for the selection of subjects to be engraved; and to DAVID DON, Esq., Lib. L.S., Mr. LAMBERT'S librarian, for his unremitted and unwearied exertions, during upwards of seven years, to facilitate the labours of Mr. SOWERBY. To ROBERT BROWN, Esq., F.R.S. V.P.L.S. &c.; to the Council of the Linnæan Society; and, again, to DAVID DON, Esq., in his capacity of librarian to the Linnæan Society, the Proprietors are much indebted for similar services; and they beg leave to thank, in a very particular manner, Messrs. LODDIGES of Hackney, for original drawings of many species, made from living plants in their unrivalled collection of exotics. Without the herbarium of Mr. LAMBERT, and the Hot-houses of Messrs. LODDIGES, this work could not have been produced.

It remains only for the Editor to state, that the botanical merits of this publication belong entirely to Professor LINDLEY, F.R.S. L.S. G.S. &c.; and J. D. C. SOWERBY, Esq., F.L.S., &c. The former gentleman determined the genera and the number of species to be arranged under them; prepared the specific characters, derivations, and accentuations; either wrote or examined the notes; and corrected the whole while passing through the press: the latter, assisted by DAVID DON, Esq., and Messrs LODDIGES, sought out the figures, dried specimens or living plants, necessary for illustration, and made drawings of them on the blocks to be engraved, in that accurate and scientific manner, and with that appropriate taste, for which his late father was long so much distinguished, and for which he himself has not yet been equalled in this or in any country. All that the Editor can deem to be his own is the plan of the work; and if this be found not to have failed in answering those expectations which the state of science, in botany and the compilation of books, might have warranted in 1822, when this work was commenced, he will have obtained all the approbation to which he is entitled.

Bayswater, May, 1829. J. C. L.

The SUPPLEMENTS which accompany the present edition of the *Encyclopædia of Plants* contain the most important species and varieties of plants which have been introduced into British gardens, or been originated there between 1827 and 1855. A new General Index is also given. The First Additional Supplement was prepared by Mr. W. H. BAXTER, Curator of the Royal Botanic Garden, Oxford; and revised by GEORGE DON, Esq., F.L.S.; and the Second Additional Supplement has been prepared by Mr. DON, assisted by Mr. DAVID WOOSTER, late Curator of the Museum at Ipswich. The drawings of the plants for the woodcuts of both Supplements have been made by J. D. C. SOWERBY, Esq., F.L.S.

The First Additional Supplement was prepared by my late husband; and in the present one I have endeavoured, as closely as possible, to follow the same plan. As, however, the publication of this Second Additional Supplement was unavoidably delayed from the difficulty of finding living specimens or dried plants, to serve as copy for some of the woodcuts, I have, assisted by Mr. WOOSTER, added an Appendix containing the most important of the plants which have been introduced since the letterpress of the Supplement was completed. In preparing this Appendix I have been greatly indebted to the *Bon Jardinier* for the present year, published by M. LOUIS VILMORIN, of Paris; and to Messrs. VEITCH, of Exeter, whose very able collector, Mr. LOBB, has introduced so many new and valuable plants.

Bayswater, April, 1855. J. W. L.

☞ To indicate when a reference to the Supplement is necessary, a cross (+) is placed in the body of the work before such genera as are divided or repeated, and also in those places where new genera should have come in; and a § before such species as have some further information given respecting them in the Supplement.

LIST OF AUTHORITIES

FOR

GENERIC AND SPECIFIC NAMES.

Abel.	*Abel* A traveller in China, and author of a Notice of Chinese plants.
Ach.	*Acharius.* A Swedish professor, and writer upon Lichens
Ad., Adans.	*Adanson.* A French systematical botanist.
Afz.	*Afzelius.* A Swedish professor.
Ag, Agh., Agdh	*Agardh* A Swedish professor, and writer upon A'lgæ, &c
Ait	*Aiton.* The superintendant of the King's garden at Kew
Alb	*Albertini* A writer upon Fúngi
Alb &Schwe.	*Albertini and Schweinitz.* Writers upon Fúngi
All.	*Allioni.* An Italian botanist.
Amm	*Ammann* An old Russian botanist
And, Andr, Andrz	*Andrzejowski.* A Russian botanist.
Ard.	*Arduini.* An Italian botanist.
Aub, Aubl.	*Aublet.* A French traveller in Guiana.
Balb	*Balbis.* A French professor of botany.
Ban	*Banks.* A great traveller and patron of science
Bat.	*Batard.* A writer upon the Flora of France.
Batsch.	*Batsch.* A writer upon Fúngi.
Baumg	*Baumgarten* A German botanist.
B. C.	*Botanical Cabinet.* By Loddiges and Sons.
Beauv	*Palisot de Beauvois* A French traveller and botanist.
Bell.	*Bellardi.* An Italian botanist.
Berg	*Bergius.* A Swedish writer upon Cape plants.
Bern, Bernh	*Bernhardi.* A German botanist.
Bert., Bertol	*Bertolini.* A writer upon the Flora of Italy.
Bess.	*Besser.* A Russian professor, resident in the Crimea.
Bieb	*Bieberstein.* A Russian botanist of great note.
Biv	*Bivona* A Sicilian botanist.
B M	*Botanical Magazine* By Curtis, Sims, &c.
Boer.	*Boerhaave.* An old Dutch botanist.
Bohm	*Bohmer.* A German botanical writer
Bolton.	*Bolton.* An English writer on Fúngi
Bon, Bonpl.	*Bonpland.* A French traveller in South America, and botanist.
Bork.	*Borkhausen.* A writer upon the Flora of Hesse Darmstadt.
Bory.	*Bory de St. Vincent* A French traveller and botanist.
Bosc.	*Bosc.* A French botanist, and traveller in North America.
Bouch.	*Boucher.* A writer upon the French Flora.
B. P.	*Brown's Prodromus Floræ Novæ Hollandiæ.*
Br.	*Robert Brown.* A celebrated English botanist, and traveller in New Holland.
Bradl.	*Bradley.* An old English writer upon succulent plants.
B. R., B. Reg.	*Botanical Register.* By Ker and Lindley
B. Rep.	*Botanical Repository.* By Andrews and others
Brid.	*Bridel.* A German writer upon mosses.
Brot.	*Brotero* A Portuguese botanist.
Brouss	*Broussonet* A French botanist, and traveller in Barbary.
Buch	*Buchanan.* An English physician, and traveller in Nepal.
Bull	*Bulliard.* A French writer on Fúngi.
Burc., Burch.	*Burchell* An English botanist, and traveller at the Cape of Good Hope
Burm., Brm	*Burmann* A Dutch editor of other people's works.
Cæsalp.	*Cæsalpinus* A famous old Italian botanist.
Ca, Cav	*Cavanilles.* A Spanish professor and botanist.
Cels	*Cels.* A French nurseryman
Cham	*Chamisso* A German traveller round the world.
Chois	*Choisy.* A Swiss botanist.
Clus	*Clusius* An old French botanist and traveller.
Colcb	*Colebrooke* A celebrated English writer upon Indian plants
Comm	*Commelin.* A Dutch garden botanist.
Corr, Correa	*Corréa de Serra.* A Portuguese botanist and diplomatist.
Crz	*Crantz.* An Austrian botanist.
Curt	*Curtis.* An English writer upon plants
Cuss.	*Cusson* A Swiss writer upon Umbelliferæ, whose wife burnt his herbarium.
Cyr.	*Cyrilli* An Italian botanist.
D. C, Dec.	*Decandolle* A celebrated French systematic botanist.
Del.	*Delile* A French professor, and traveller in Egypt.
Desf.	*Desfontaines.* A French botanist, and traveller in Barbary
Desv	*Desvaux* A French professor of botany.
Dicks.	*Dickson* An English cryptogamic botanist.
Dill, Dillw	*Dillwyn.* An English writer upon Confervæ
Dittm	*Dittmarr.*
Domb	*Dombey.* A French traveller in South America.
Donn.	*Donn* An English gardener and botanist
Dufr	*Dufresne* A French writer upon Valerians.
Duh	*Duhamel* A celebrated French physiological botanist.
Dum	*Dumont Courset* A writer upon French garden plants
Dun.	*Dunal.* A French professor of botany.
Durot	*Du Roi* A German writer upon plants.
E B, E. Bot	*English Botany* By Sowerby and Smith.
Ehr.	*Ehrhart.* A German botanist.
Ehrenb.	*Ehrenberg.* A German traveller in Arabia, &c.
Esp	*Esper.* A German writer on Fúngi.
Ettl	*Ettlinger.* A German writer on Salvia.
Ex. B	*Exotic Botany.* By Smith.
Fisch.	*Fischer.* A Russian botanist.
Fl.	*Flügge.* A German writer upon grasses.
Fl. Brit.	*Flora Britannica.* By Sir James Edward Smith.
Fl. Dan.	*Flora Danica.* By Oeder, Hornemann, and others.
Fl. Lond	*Flora Londinensis.* By Curtis and Hooker.
Flœrke.	*Flœrke.*
Fl. Per, Flp.	*Flora Peruviana.* By Ruiz and Pavon
Forsk.	*Forskahl.* A Danish naturalist, and traveller in Arabia

Forst.	*Forster.* A traveller in the South Seas with Captain Cook
Fr.	*Fries.* A Swedish botanist, and writer upon Fungi
Frax.	*Fraxer* A gardener and collector of plants in North America.
Frol.	*Frölich* A German writer upon Gentiana.
Funck.	*Funck* A German cryptogamic botanist.
Gae, Gært.	*Gærtner* A celebrated German carpologist.
Gay	*Gay.* A French botanist
Gledtsch.	*Gledtsch.* A German botanist
Gmel., Gm.	*Gmelin.* A Russian botanist, and traveller in Siberia.
Gouan	*Gouan.* A French botanist.
Gr., Grev., Greville.	*Greville* An English botanist, and writer upon cryptogamic plants
Hal	*Halcs.* A distinguished English writer upon physiological botany
Hänke	*Hænke.* A German botanical writer
Haw	*Haworth* An English writer upon succulent plants
Hayne.	*Hayne.* A German botanist
Hedw.	*Hedwig.* A German cryptogamic botanist.
Heist.	*Heister.* A German botanist
Herb.	*Of the Herbarium*
Herit.	*Heritier.* A French botanist.
Hill.	*Hill.* An English compiler of botanical matters.
H. K.	*Hortus Kewensis.* A catalogue of the plants growing in the King's garden at Kew.
Hoff, Hoffm.	*Hoffmann.* A German writer upon Umbelliferæ, &c
Holmsk.	*Holmskiold* A Danish botanist.
Hook.	*Hooker.* An English botanist, and professor at Glasgow.
Hoppe	*Hoppe.* A German botanist, and collector of plants
Horn, Hornem.	*Hornemann.* A Danish botanist and professor.
Hort	*Of the gardens.*
Host	*Host* An Austrian writer upon Grapes and European plants.
H Par.	*Of the Paris garden*
Hud., Huds.	*Hudson.* An English writer upon British plants
Humb.	*Humboldt* A celebrated Prussian traveller and philosopher
Jack, Jacks.	*Jackson* An English botanist
Ja., Jac., Jacq.	*Jacquin.* An Austrian traveller in South America, and botanist
Jon.	*Jones.* An accomplished writer upon Indian matters
J., Juss.	*Jussieu* A celebrated French systematic botanist.
Kaulf	*Kaulfuss.* A German writer upon Ferns.
Ker.	*Ker.* An English garden botanist.
Kit.	*Kitaibel* A Hungarian botanist.
Kn Pr.	*Knight's Proteaceæ*
Kon.	*Konig* Several German naturalists of this name.
Kunth.	*Kunth.* A Prussian botanist
Kunz.	*Kunze.* A German cryptogamic botanist.
Lag.	*Lagasca.* A Spanish botanist and professor.
Lam.	*Lamarck.* A French botanist.
La Peyr., Lap.	*La Peyrouse* A French writer upon the plants of the Pyrenees.
Lawr.	*Lawrence* (Miss). An English flower painter.
Lax.	*Laxmann.* A German writer on Siberian plants.
Ledeb.	*Ledebur.* A botanist, and traveller in Siberia.
Lehm.	*Lehmann.* A German botanist
L. fil.	*Linnæus the younger* The son of the great Linnæus
L'Her.	*L'Heritier.* A French botanist.
Lightf.	*Lightfoot.* A writer upon the Scottish Flora.
Lind., Lindl.	*Lindley.* An English botanist, and professor in London.
L. K. *Lk., Link.*	*Link.* A Prussian botanist *Link.*
L., Linn.	*Linnæus.* The celebrated Swedish reformer of natural history.
Lob.	*Lobel.* An old writer upon plants.
Lodd.	*Loddiges.* English nurserymen and botanists.
Loe	*Loesel.* An old Prussian botanist.
Lois.	*Loiseleur Deslongchamps.* A French botanist.
Lour.	*Loureiro.* A Portuguese traveller in Cochin China.
L. T.	*Linnean Society's Transactions.*
Lyngb	*Lyngbye.* A Danish writer upon cryptogamic matters
Marcg	*Marcgraan.* An old Dutch traveller in Brazil
Mart.	*Martius.* A Bavarian botanist, and traveller in Brazil.
Mass	*Masson.* A collector of plants at the Cape, and elsewhere.
Mayer.	*Mayer.* Several German botanists of this name
M. B	*Marschall v. Bieberstein.* A writer upon Russian botany.
Med	*Medicus* A German botanist of the last century
Menz	*Menzies* A Scotch botanist, and traveller round the world with Vancouver
Mert	*Mertens.* A German professor
Mey	*Meyer* A German botanist.
Mi, Mich	*Michaux.* A French botanist, and traveller in North America.
Mik	*Mikan.* A German writer on Brazilian plants
Mill.	*Miller* An English gardener and botanist
Mir.	*Marbel* A French physiological botanist.
Mohr	*Mohr.* A German cryptogamic writer
Mol.	*Molina* An Italian writer upon the natural history of Chili.
Monch	*Monch* A German botanist.
Morett.	*Moretti*
Moug.	*Mougeot* A German cryptogamic botanist.
Muhl, Mhl	*Muhlenberg.* A North American botanist.
Murr.	*Murray.* A German botanist.
Mutis	*Mutis* A Spanish botanist, resident in New Grenada.
Mx	*Michaux.* See above
Neck	*Necker* A German writer upon botanical affairs
Nees	*Nees v Esenbeck* A German botanist
Nois	*Noisette.* A French nurseryman
Nor	*Noronha* A Spanish botanist who visited Madagascar
Nutt	*Nuttall* A North American botanist.
Ort	*Ortega* A Spanish botanist
Otth	*Otth* A French writer in Decandolle's Prodromus
Otto.	*Otto* A Prussian gardener
Pall	*Pallas* A Russian traveller and naturalist
Panz	*Panzer* A German botanist.
P de B, Pal de Beauv	*Palisot de Beauvois.* A French botanist, and traveller in Africa
Pers	*Persoon.* A German botanist.
Pet.	*Petiver* An old English botanist.
Pet Th	*Du Petit Thouars* A French botanist, and traveller in Madagascar.
Ph., Psh	*Pursh.* A Prussian botanist, and traveller in North America.
P L	*Paradisus Londinensis*
Plin	*Pliny.* An ancient writer upon natural history.
Plu.	*Plumier.* A French botanist, and traveller in the West Indies
Poir	*Poiret.* A French botanical compiler.
Post.	*Poiteau.* A French botanist and draughtsman.
Poll	*Pollich* A German writer on the plants of the Palatinate.
Pour.	*Pourret.* A French botanist
P S	*Persoon's Synopsis.*
Radd.	*Raddi* An Italian cryptogamic botanist, and traveller in Brazil.
Raf., Rafi.	*Rafinesque Schmalz.* A modern writer upon botanical matters.
R & S.	*Romer and Schultes.* German editors of Linnæus's Species Plantarum.
R.B., R. Br., R. Brown.	*Robert Brown.* A distinguished English botanist, and traveller in New Holland.
Rchb.	*Reichenbach.* A German botanist.
Rebent.	*Rebentisch.* A Prussian botanist.
Red	*Redouté* A French botanical draughtsman.
Reth.	*Relhan.* A writer upon the Flora of Cambridgeshire.
Retz., Rtz	*Retzius.* A German botanist.
Rich.	*Richard.* A French botanist.

Risso.	*Risso.* An Italian writer upon Oranges
R. I..	*Redouté's Liliacées*
Rosc.	*Roscoe.* An English botanist, and writer upon Scitamineæ.
Roth.	*Rottboll.* A Danish botanist.
Roth, Rth.	*Roth.* A German botanical writer.
Roxb , Rox.	*Roxburgh.* An Indian botanist.
Roy , Royen.	*Van Royen* A Dutch botanist.
Rudge.	*Rudge* An English writer upon botanical subjects.
Rudol	*Rudolph.* A German botanist.
Sab., Sabine	*Sabine.* An English amateur of botany.
Sal , Salisb.	*Salisbury.* An English botanist
Salm.	*The Prince of Salm Dyck.* A noble German amateur
Savi	*Savi.* An Italian botanist
Sc., Sch.	*Schkuhr.* A German writer upon Grasses and Ferns.
Schæff	*Schæffer.* A German writer upon Fúngi
Schl ,Schlect.	*Schlechtendahl* A German botanist.
Schleich.	*Schleicher.* A Swiss plant collector.
Schm , Schmidt.	*Schmidt* A Bohemian botanist
Schneev.	*Schneevoght.* A Dutch nurseryman
Schott	*Schott*
Schousb.	*Schousboe.* A writer upon the Flora of Morocco.
Schr.	*Schreber.* A German botanist
Schrad	*Schrader.* A German botanist
Schrank.	*Schrank.* A Bavarian botanist.
Schult.	*Schultes.* A German botanist.
Schum	*Schumacher* A Danish botanist
Schw , Schwægr.	*Schwægrichen.* A German cryptogamic botanist
Scop.	*Scopoli* An Italian botanist.
Sib.	*Sibthorp.* An English botanist, and traveller in Greece
Sims	*Sims* An English garden botanist
S M.	*Sole's Monograph of Mints*
Sm	*Smith* An English botanist, and purchaser of the Linnean Herbarium.
Smith Fl. Brit	*Smith's Flora Britannica*

RULES FOR PRONOUNCING BOTANICAL NAMES.

SYLLABLES.

In classical words *there are as many syllables as there are vowels*; except when *u* with any other vowel follows *g*, *q*, or *s*, and when two vowels unite to form a diphthong The diphthongs are *æ*, *œ*, *ai*, *ei*, *oi*, *ui*, *au*, *eu*, and *ou* These seldom coalesce in final syllables; *oo*, *ee*, *ea*, and other combinations which never occur as diphthongs in classical words, follow, in commemorative names, the pronunciation of their primitives, as Teédia, Woódsia

VOWELS

In this work *the accented vowels* are indicated by the mark placed over each, but as this only points out the vowel on which the stress is laid, the following observations will be found useful in showing when the vowel is to be sounded long, and when short In addition to the primary accent, every word of more than three syllables contains a secondary accent, which is regulated by the same rules The secondary accent must always be at least two syllables before the primary accent, as in Chĕlidònium, for its place the ear is a sufficient guide, and even were it entirely omitted, still, however inharmonious, it would not be incorrect

Every accented penultimate vowel is pronounced long, when followed by a vowel or a single consonant, as Achillèa tomentòsa, but it is shortened when followed by two consonants or a double one, as Sórbus, Táxus; except when the first consonant is a mute and the second a liquid, as A'brus

Every accented antepenultimate vowel, except *u*, is pronounced short, as Hellĕborus, Hŭmulus; but when succeeded by a single consonant, followed by *e* or *i* and another vowel, it is lengthened, as Stellària, except *i*, which is short, as Tĭlia.

A unaccented, ending a word, is pronounced like the interjection *ah*, as Stĭcta (*ah*)

E final, with or without a consonant preceding, always forms a distinct syllable, as Silène, *A'loe*; also when the vowel is followed by a final consonant as Tri-cho-ma-nes, not Tri-cho-manes

I unaccented, if final, sounds as if written *eye*, as Spica vènti (*eye*); but, when it ends a syllable not final, it has the sound of *e*, as Méspilus (*Mespelus*), Smithii (*Smithe-eye*)

Y is subject to the same rules as *i*

The diphthongs *æ* and *œ* conform to the rules for *e*, *ei* is generally pronounced like *eye*, the other diphthongs have the common English sounds

CONSONANTS.

C and *g* are hard before *a*, *o*, and *u*, as Córnus, Gàlium, soft before *e*, *i*, and *y*, as Cetrària, Citrus.

T, *s*, and *c*, before *ia*, *ie*, *ii*, *io*, *iu*, and *eu*, when preceded by the accent, change their sounds, *t* and *c*, into *sh*, as Blètia, Vícia, and *s* into *zh*, as Blàsia but, when the accent is on the first diphthongal vowel, the preceding consonant preserves its sound, as aurantiacum.

Ch, before a vowel, is pronounced like *k*, as Chelidònium (*kel*), Cólchicum (*kolkekum*); but in commemorative names it follows their primitives, as Richardsònia, in which the *ch* is soft

Cm, *cn*, *ct*, *gm*, *gn*, *mn*, *tm*, *ps*, *pt*, and other uncombinable consonants, when they begin a word, are pronounced with the first letter mute, as Ptèris (*teris*), Cnicus (*nikus*), Gmelina (*melina*), Gnidia (*nidia*); in the middle of a word they separate as in English, as Lap-sàna, Lĕrn-na.

Ph, followed by a mute, is not sounded; but, followed by a vowel or a liquid, sounds like *f*, as Phlèum (*fleum*).

Sch sounds like *sk*, as Schœ'nus (*skenus*); in *ll* and *zm* both letters are heard.

S, at the end of a word, has its pure hissing sound, as Dáctylis, except when preceded by *e*, *r*, or *n*, when it sounds like *z*, as Ribes (*ez*)

X, at the beginning of a word, sounds like *z*, as Xánthium; in any other situation it retains its own sound, as Táxus, Tamarix. (*Extracted from the Gardener's Magazine*, vol. v. p 232)

GENERAL INTRODUCTION.

THE science of Botany consists of two departments, Phytology and Physiology. This Encyclopædia is exclusively devoted to the former department, and it is limited to the plants in Britain, indigenous and exotic.

Phytology, or the History of Plants, comprehends the knowledge of the external parts of plants, the determination of their names. their classification, their uses, their individual history, and their geography. The object of this work is to convey, in the most convenient manner and in the least possible space, a knowledge of the various particulars which arrange themselves under these heads.

A knowledge of the external parts of plants will be readily and agreeably obtained by turning over the first 700 pages of this work at random, looking at the engravings, and comparing them with the names and descriptions to which they refer; the same process will enable the reader to recognise, at sight, the 10,000 species figured in the 700 pages. In this way, botanical figures supply the place of a botanical garden; and the beginner learns the natures, the technology, and the general appearances of plants, almost as easily and naturally in the one case as he does in the other.

To determine the name of an unknown plant, it is necessary to be furnished with a specimen of it in flower. The parts of the plant including those of the flower being already known by the process above mentioned, its class will be ascertained by the Table of the Linnean System (p. 2.), and its order, genus, species, &c., by turning to the page referred to at the end of the class. Thus, if you hold in your hand a specimen of *Phillyrèa angustifòlia* in flower, on counting the stamens and pistils you find it belongs to Class II. Order 1., from which, in the Table in p. 2., you are referred to the details of the class in p. 8.; you there find, under Order 1., the characters of all the genera of that order, and that the flower which you hold in your hand best agrees with the definition given of the genus *Phillyrèa*, No. 33. But you wish to know the species; and, *Phillyrèa* being No. 33., you turn to that number in the details of the genera in the subsequent pages. After comparing its leaves with the specific character given of the different species, you find it best agrees with *P. angustifòlia*; and, finding this species numbered 143., you look for that number in the two plates of engravings in the lower parts of the pages, and find a figure which confirms your decision. By reading the abridgements in the line which follows the word angustifòlia, together with the note to the generic name *Phillyrèa* at the bottom of the page, you find in an abridged form its English name, habit, habitation in the garden, popular character, the height to which it grows, its time of flowering, the colour of its flower, its native country, the year of its introduction into Britain, its propagation, the soil in which it grows, a reference to a work where it is figured and described at greater length, and its uses in the arts, or whatever else is remarkable in its history. You find, also, the natural order to which the genus belongs, the etymology of the name, the French or German name, if the plant has a vernacular name in these languages, and, both generic and specific names being accentuated, you have the pronunciation. On turning to the Table of Synonymous Names (p. 1108.), you will find its vernacular name in the languages of the countries where it is common. If it is not so common in any country as to have received a vernacular name, it will not be found in that list. Finally, if you should not understand any of the terms used in the definition of the specific characters or in the notes, on turning to the Glossary (p. 1094.) you will find them explained, and illustrated where necessary by engravings.

When the beginner has a leaf or any part of a plant not in flower, he may ascertain, by turning to the Introduction to the Natural System (p. 1051.), to which of the three grand divisions of the vegetable kingdom it belongs, and may learn other particulars, according to circumstances which it is unnecessary to detail. Without the flower, he will not be able by the Natural System to determine the name of a plant; but, what is often much more important, with a very small portion of any part of a plant he will be able to discover some thing of its nature, an advantage which does not belong to the System of Linnæus.

The classification or arrangement of plants is made by botanists with a view to two objects: the first, to facilitate the discovery of their names, and thus to know them individually; the second, to give general ideas respecting their natures, and thus to know them as belonging to large masses or groups. Hitherto, no system has been discovered which has attained both these objects in an equal degree of perfection; but the Linnean Arrangement has made the greatest advances in teaching how to discover the names of plants, and the Jussieuean in teaching us their natures, and how to recognise them as belonging to certain masses or groups. In order that the student may acquire both these kinds of knowledge, we have given both arrangements. We have begun with the Linnean, not only as being best adapted for beginners, but because it is necessary to know how to discover the name of a plant, as well as to be able practically to recognise a number of plants, before attempting to know their natures, or to combine them in masses or groups.

"The standing objection to botany," says White of Selbourne, "has always been, that it is a pursuit that amuses the fancy and exercises the memory without improving the mind or advancing any real knowledge; and where the science is carried no farther than a mere systematic classification, the charge is but too true. But the botanist, who is desirous of wiping off this aspersion, should be by no means content with a list of names; he should study plants philosophically, — should investigate the laws of vegetation, — should examine the powers and virtues of efficacious herbs, — should promote their cultivation, and graft the gardener, the planter, and the husbandman, on the phytologist: not that system is by any means to be thrown aside; without system the field of nature would be a pathless wilderness; but system should be subservient to, not the main object of, our pursuit."

"After all that has been effected, or is likely to be accomplished hereafter," Professor Lindley observes, "there will always be more difficulty in acquiring a knowledge of the Natural System of Botany than of the Linnean. The latter skims only the surface of things, and leaves the student in the fancied possession of a sort of information which it is easy enough to obtain, but which is of little value when acquired; the former requires a minute investigation of every part and every property known to exist in plants, but when understood has conveyed to the mind a store of information, of the utmost use to man, in every station of life. Whatever the difficulties may be of becoming acquainted with plants according to this method, they are inseparable from botany, which cannot be usefully studied without encountering them." *

The History of Plants comprehends every thing relating to their use in the arts, or in any way as connected with man, with animals, or with civilisation. The Geography of Plants relates to the countries in which they are indigenous or acclimated, and to the soils and situations in which they grow or may be grown. Every thing essential in relation to these points will, as we have already stated, be found after the name of each species in the text, after the name of the genus in the notes below, under the natural order to which the genus belongs in the Natural Arrangement (Part II. p. 1051.), in the Table of Synonymes (p. 1108.), or in the Glossary (p. 1094.).

The General Index (p. 1143.) contains not only the names of the genera, and of the classes and orders of both systems, but those of all the remarkable species, and the more important systematic and British synonymes both of genera and species. The various names being included in the same alphabet, this Index may therefore be consulted as a Dictionary of Plants.

* Synopsis of the British Flora, arranged according to the Natural Orders, &c., pref. p. xi.

THE

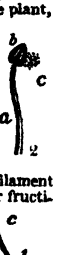
ENCYCLOPÆDIA OF PLANTS.

PART I.

LINNEAN ARRANGEMENT.

THE main object of the artificial system of botanical arrangement is to facilitate the discovery of the names of plants. For this purpose some one organ, common to plants in general, is fixed on; and, according to certain conditions in which this organ is found, individual species are referred to their places in the system, as words, by their initial letters, are referred to their places in an alphabetical dictionary.

In the progress of artificial systems different organs have been fixed on by different botanists; but those which have been most extensively employed are the corollas by Tournefort, and the stamens and pistils, by Linnæus. The system of Tournefort has been a good deal employed in France, and may be considered as the artificial system of that country, that of Linnæus has been employed in most other countries, and is justly esteemed by far the most perfect artificial system which has hitherto been produced. It is, therefore, adopted in this work.



The application of the Linnean system in practice, Sir J. E. Smith observes, is, above all other systems, easy and intelligible. Even in pursuing the study of the natural affinities of plants, this botanist affirms "that it would be as idle to lay aside the continual use of the Linnean system, as it would be for philologists and logicians to slight the convenience, and indeed necessity, of the alphabet, and to substitute the Chinese character in its stead." (*Introduct to Bot.*) "The student of the Linnean artificial system," he elsewhere observes, "will soon perceive that it is to be understood merely as a dictionary, to make out any plant that may fall in his way" (*Gram of Bot.*) "If we examine," says Decandolle, "the artificial systems which have been hitherto devised, we shall find the most celebrated of them, that which was proposed by Linnæus, to possess a decided superiority over all others, not only because it is consistently derived from one simple principle, but also because the author of it, by means of a new nomenclature, has given to his terms the greatest distinctness of meaning" (*Elements of the Philos. of Plants, by Decandolle and Sprengel.*) Whether or not subsequent advances in science may enable botanists to dispense with the Linnean system altogether, it is not for us to affirm, but in the meantime nothing can be more certain than that the Linnean system is the best leading arrangement for such a work as the present, in the existing state of botanical knowledge in Britain *

According to the Linnean system all plants are furnished with flowers, either conspicuous or inconspicuous. The plants with conspicuous flowers are arranged according to the number and position of their stamens and pistils; those with inconspicuous flowers are arranged according to the situation of the flowers on the plant, or according to other circumstances in the plant itself.

1

To discover the name of a plant by the Linnean system, therefore, all that is necessary for a beginner is to possess a specimen of it in flower, and to be able to know its different parts by the names given them by botanists. To discover the class, order, and genus of a plant, it is only necessary to be able to distinguish and name the different parts of the flower. These parts are: the calyx or cup (*fig.* 1 *a*), which is that leaf, or those leaves, by which the flower is usually enclosed when in bud, and which, when the flower is expanded, appear under it. The corolla (*corona*, a crown) is the coloured leaf, or leaves, of a flower (*fig* 1. *b*). The stamen (or first principle of any thing) is the thread-like process, or processes, immediately within the leaves of the corolla (*fig* 2.). It consists of two parts, the filament or thread (*a*), and the anther (*b*); this anther contains what is called the pollen, or fructifying meal (*c*). In the centre of the flower is the pistil (*fig.* 3.): it consists of three parts, the germen, or rudiments of the fruit or seed (*a*), the style (*b*), and the stigma or summit(*c*), which crowns the style, and is destined to receive the fructifying pollen.

2

3

The pistil and stamen are the essential parts of a flower. The corolla or the calyx may be wanting, and yet the flower will be termed perfect, because the absence of those parts is no obstacle to reproduction. Even the style and the filament may be absent without preventing the formation or ripening of the fruit; and there are many flowers which have the anther sitting close to the corolla, &c., without a filament, and the stigma to the germen without a style, but the anther, the germen, and the stigma are essential.

The seed is contained in the pericarp, or seed-vessel, which is the germen when grown to maturity. The name of seed-vessel varies according to its form, substance, &c.; but the word pericarp (*peri*, about, *karpos*, a fruit) is applicable to all its varieties. The receptacle is the base or medium which connects the other parts of the fructification. (*Magazine of Natural History*, vol. i. p. 233.)

The degree of knowledge conveyed by the following Table, and the preceding observations, will enable a beginner to discover the class, order, and genus of any plant which he may find in flower.

---

* The best work in the English language for acquiring a knowledge of the Linnean system of botany is *Smith's Introduction to Botany*, there are also various other works nearly as good, and detailed and familiar *Introductions* to both the *Linnean* and *Jussieuean Systems* will be found in the first and second volumes of *The Magazine of Natural History.*

LINNEAN ARRANGEMENT.

First Grand Division. — *Plants with conspicuous Flowers* (*Phanerogàmia*).

In the same flower,
Male and female organs distinct,
Stamens not united either above or below,
Generally of equal length,

Stamens and Pistils

In Number,

Classes.		Orders.
One,	1. Monándria (*monos*, one, *aner*, a man). Example, *Lìthrum capitàtum.* 1	2. Monogynia (*monos*, one, *gyne*, a woman), Digynia (*dis*, twice, *gyne*, a woman).
Two,	2. Diándria (*dis*, twice, *aner*, a man). *Verónica Chamædrys.* 8	3. Monogynia, Digynia, Trigynia (*tris*, thrice, *gyne*, a woman).
Three,	3. Triándria (*tris*, thrice, *aner*, man). *Poa ánn* 30	3. Monogynia, Digynia, Trigynia.
Four,	4. Tetrándria (*tetra*, four, *aner*, a man) *Córnus sanguínea.* 76	3. Monogynia, Digynia, Tetragynia (*tetra*, four, *gyne*, a woman).
Five,	5. Pentándria (*pente*, five, *aner*, a man). *Lysimàchia ephémerum.* 108	6. Monogynia, Digynia, Trigynia, Tetragynia, Pentagynia (*pente*, five, *gyne*, a woman), Polygynia (*polys*, many, *gyne*, a woman).
Six,	6. Hexándria (*hex*, six, *aner*, a man) *Scilla bifólia.* 236	4. Monogynia, Digynia, Trigynia, Polygynia
Seven,	7. Heptándria (*hepta*, seven, *aner*, a man) *Æsculus Hippocástanum* 296	4. Monogynia, Digynia, Tetragynia, Heptagynia (*hepta*, seven, *gyne*, a woman).
Eight,	8. Octándria (*okto*, eight, *aner*, a man) *Fuchsia coccínea.* 300	4. Monogynia, Digynia, Trigynia, Tetragynia.
Nine,	9 Enneándria (*ennea*, nine, *aner*, a man) *Rhèum Rhapónticum.* 332	3 Monogynia, Trigynia, Hexagynia (*hex*, six, *gyne*, a woman)
Ten,	10. Decándria (*deka*, ten, *aner*, a man) *Saxífraga umbròsa.* 338	5 Monogynia, Digynia, Trigynia, Pentagynia, Decagynia (*deka*, ten, *gyne*, a woman).
Twelve,	11. Dodecándria (*dodeka*, twelve, *aner*, a man). *Sempervivum tectórum* 392	6 Monogynia, Digynia, Trigynia, Tetragynia, Pentagynia, Dodecagynia (*dodeka*, twelve, *gyne*, woman).
Many, frequently twenty, attached to the calyx,	12 Icosándria (*eikos*, twenty, *aner*, a man) *Cratægus Oxyacántha* 408	3 Monogynia, Di-pentagynia (*dyo*, two, *pente*, five, *gyne*, a woman), Polygynia
Many, generally upwards of twenty, not attached to the calyx,	13. Polyándria (*polys*, many, *aner*, a man) *Clématis erécta.* 456	5 Monogynia, Digynia, Trigynia, Pentagynia, Polygynia.

Of unequal length,

Two long, and two short,	14 Didynàmia (*dis*, twice, *dyo*, two, *nema*, a filament) *Teucrium lucidum.* 490	2 Gymnospérmia (*gymnos*, naked, *sperma*, seed), Angiospérmia (*aggeion*, a vessel, *sperma*, seed).
Four long, and two short,	15. Tetradynàmia (*tetra*, four, *dyo*, two, *nema*, a filament) *Ráphanus sativus.* 536	2 Siliculòsa (*silicula*, a silicle), Siliquòsa (*siliqua*, a silique)

Stamens united,

by the filaments, into one body,	16 Monadélphia (*monos*, one, *adelphos*, brother) *Málva fragrans.* 560	7 Triándria, Pentándria, Heptándria, Octándria, Decándria, Dodecándria, Polyándria
by the filaments, into two bodies,	17. Diadélphia (*dis*, twice, *adelphos*, a brother) *Onónis arvénsis.* 598	4 Pentándria, Hexándria, Octándria, Decándria
by the filaments, into many bodies	18. Polyadélphia (*polys*, many, *adelphos*, brother). *Hypéricum quadrán.* 650	4 Decándria, Dodecándria, Icosándria, Polyándria.
by the anthers or tops, into a cylinder,	19. Syngenèsia (*syn*, together, *genesis*, origin). *Cichórium Intybus.* 660	5. Polygàmia æquàlis (equal), Polygàmia superflua (superfluous), Polygàmia frustrànea (*frustra*, in vain), Polygàmia necessària (necessary), Polygàmia segregàta (separated).

Male organs (stamens) attached to, and standing upon the female (pistil),	20. Gynándria (*gyne*, a woman, *aner*, a man). *Ophrys apífera.* 748	3. Monándria, Diándria, Hexándria.

In different flowers,

on the same plant,	21. Monœcia (*monos*, one, *oikos*, house) *Cucúrbita Pépo.* 768	8. Monándria, Diándria, Triándria, Tetrándria, Pentándria, Hexándria, Polyándria, Monadélphia.
on different plants,	22 Dioecia (*dis*, twice, *oikos*, house) *Cánnabis sativa* 816	14. Monándria, Diándria, Triándria, Tetrándria, Pentándria, Hexándria, Octándria, Enneándria, Decándria, Dodecándria, Icosándria, Polyándria, Monadélphia, Gynándria.
on the same or different plants along with hermaphrodite flowers,	23. Polygàmia (*polys*, many, *gamos*, marriage) *Gleditschia triacánthos.* 852	2. Monœcia, Dioecia.

Second Grand Division — *Plants with inconspicuous Flowers* (*Cryptogàmia*).

Reproductive organs scarcely visible, so that they have not been distinctly described,

24. Cryptogàmia (*kryptos*, concealed, *gamos*, marriage), 874

11 Gonopterides (*gonos*, seed, *pteris*, fern), Stachyopterides (*stachys*, a spike, *pteris*, fern), Poropterides (*poros*, a pore, *pteris*, fern), Filices (*filix*, a fern), Hydropterides (*hydor*, water, *pteris*, fern), Schizmatopterides (*schizma*, a cleft, *pteris*, fern), Musci (*muscus*, moss), Hepaticæ (*hepar*, a liver), Algæ (*alga*, sea weed), Lichens (Greek name), Fungi (*fungus*, a mushroom)

To discover the particular species or variety of a plant it is necessary to become acquainted with the forms and different conditions of the leaves, stems, and other parts of the bodies of plants, as well as with their flowers, and this knowledge, as we have before stated (p xix.), will be obtained with the greatest facility by turning to the Glossary (p. 1094.), and comparing the definitions with the engraved figures.

Class I. — MONANDRIA. 1 Stamen.

This class, which is not large, contains chiefly exotic plants, and of these the tribe of Scitamineæ is considered one of the most beautiful families of the vegetable kingdom. The useful productions are chiefly the Ginger, Cardamom, and Turmerick, spices highly esteemed, and in general use wherever they are known, and can be procured. The Salicornia, a native of our sea-shores, is burned for kelp, and pickled for culinary purposes. Almost all the plants of this class are aquatics, or grow in marshes. They chiefly thrive best in a sandy loam, from which their roots should be well cleaned every year.

The genera of the Scitamineæ and Cannеæ have been remodelled by Roscoe, whose arrangement has received considerable improvement from the hand of the late Dr. Roxburgh. The nature of the floral envelope of those plants has long been a subject of dispute among botanists, some considering the colored inner segments to be true petals and to be variable in numbers, and others, supposing them to be part of the calyx and constant in number, their occasional variation in number being capable of explanation. Persoon (*Synopsis*, p 1) is of opinion that many of the genera of the first section ought to be referred to Gynandria. According to Willdenow and others, the following species belonging to other classes have only one stamen

Monogynia. Mangifera indica; Alchemilla aphanes, several species of Scirpus, Cyperus, Schœnus, Kyllinga, Cryptostomum monandrum, Chorizandra, Polycnemum monandrum, Hopea.

Digynia. Lacistema, Leersia, Salsola, and many grasses.

Order 1 MONOGYNIA.  1 Stamen 1 Style

§ 1. *Germen inferior, anther simple, style erect, free. Flowers spathaceous.*

1. *Canna.* Anther attached to the edge of the petal-like filament. Style thick, club-shaped. Stigma linear, obtuse.
2. *Maranta.* Anther attached to the petal-like filament Style petal-shaped. Stigma three-sided. Flowers panicled.
3. *Calathea* Anther attached to the petal-like filament. Style petal-shaped. Stigma cuculiate Flowers in close heads.
4. *Thalia.* Anther attached to its proper filament Style depressed. Stigma depressed, perforated, and gaping.
5. *Phrynium.* Anther attached to its proper filament. Style united to the tube of the corolla, hooked at the end. Stigma funnel-shaped. Seeds with an arillus.

§ 2. *Germen inferior, anther double, style inclosed in the furrow formed by the anther. Flowers spathaceous*

6. *Hedychium.* Anther naked Tube of the corolla long and slender, with both limbs 3-partite, the interior one resupinate. Capsule dry
7. *Roscoea.* Anther 2-lobed, incurved, surrounding the style with an appendage split at the base Outer limb of the corolla 3-partite, with the upper segment erect and fornicate Inner limb 2-lipped.
8. *Alpinia.* Anther not crowned. Interior limb of the corolla with one lip. Capsule berried. Seeds with an arillus.
9. *Heliconia.* Anther in some marginal. Filament linear, longer than the anther, with a very short rounded entire or 2-lobed appendage. Capsules crustaceous Seeds with an arillus
10. *Zingiber* Inner limb of the corolla with one lip Anther with a simple recurved horn at the end.
11. *Costus.* Interior limb of the corolla nearly campanulate, split at the back. Filament lanceolate. Anther in the centre of it or at some distance from the end. Seeds naked.
12. *Kæmpferia.* Tube of the corolla long and slender, with both limbs 3-partite. Anther with a 2-lobed crest.
13. *Amomum.* Inner limb of the corl with 1 lip. Anther with an entire or 2-lobed crest Seeds with an arillus.
14. *Curcuma.* Both limbs of the corolla 3-partite. Anther with two spurs at the base. Seeds with an arillus.
15. *Globba.* Inner limb of the corolla 2-lobed or none Filament hollow at the base, with a wedge-shaped lip Anther with an appendage or none. Seeds attached to 3 parietal placentas
16. *Mantisia.* Outer limb of the corolla 3-partite, inner filiform with a double trifid limb Filament 4-partite at the end.

§ 3. *Germen superior, corolla irregular.*

17. *Phlydrum.* Calyx 2-leaved colored. Filaments 3 united at the base, the two lateral ones barren and petal-shaped. Seeds numerous, minute.

§ 4 *Germen inferior, corolla irregular Flowers naked*

18. *Lagenia.* Cal. 4-leaved. Cor. 4-petaled, unequal. Filaments two one antheriferous, the other petal-shaped-abortive. Caps. 4-valved, 4-celled, many seeded.

§ 5. *Germen inferior, corolla regular, flowers naked.*

19. *Boerhaavia.* Cal. 1-leaved, ob-conic, inclosing the seed. Cor. plaited, on the end of the calyx.
20. *Centranthus.* Cor. 5-lobed, regular, spurred. Caps. 1-celled, crowned with the limb of the calyx expanded into a plumose pappus.

§ 6. *Apetalous.*

21. *Pallichia.* Cal. 1-leaved, 5-toothed. Seed 1. Fruit upon the heaped, berried scales of the receptacle
22. *Salicornia.* Cal. turbinate, entire, fleshy. Stamen inserted into the bottom of the cal. Style 2-fid. Utricle inclosed in the fleshy calyx. Seed vertically compressed.
23. *Hippuris.* Cal. entire, minute. Style in the hollow of the anther. Germen inferior, one seeded, crowned by the rim of the calyx.
24. *Zostera.* Spadix linear in the sheath of the leaf, bearing seed on one side. Stamens opposite the germs and alternate with them, sessile. Caps. one-seeded.
25. *Chlorendium.* Stamen irregular, fleshy, lobed, fixed to the side of the germen. Stigma capitate. A fungus.

Order 2. DIGYNIA.  1 Stamen. 2 Styles.

26. *Cordyperanum.* Cal. 2-leaved. Cor. 0. Seed one, oval, convex-plane. (Stamens often 5.)
27. *Callitriche.* Cal. 2-leaved. Pet. 0. Caps. 2-celled, 4-seeded.
28. *Bitteria.* Cal. trifid. Cor. 0. Seed one, immersed in a berried calyx.
29. *Aspicarpa.* Cal. 5-parted. Cor. 0. Stamen included. Germen and Stigma 2-lobed. Fruit cartilaginous, 1-seeded.

History, Use, Propagation, Culture,

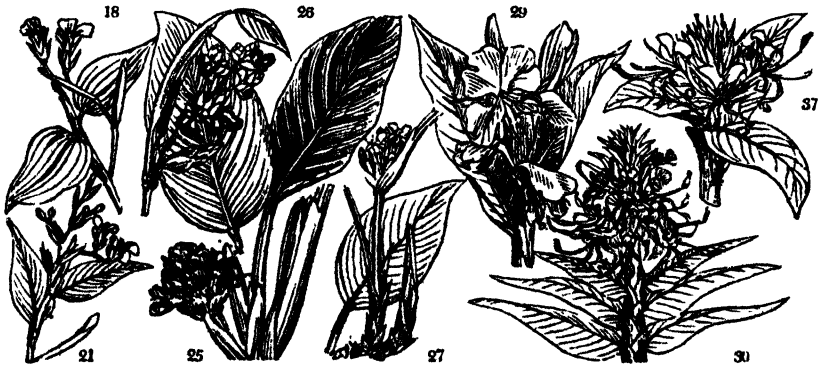
1 *Canna* From a Celtic word signifying a cane or mat. *Le Balisier*, Fr *Blumenrohr*, Ger. *Canna*, Ital. The first three species are found wild within the tropics on all the continents, and chiefly in moist woods, or spongy woody wastes. In America and the Brazils, they are known by the name of wild plantain, and their leaves are used as envelopes for many objects of commerce; from which circumstance, the French name of the plant (*balisier*) is said to have arisen; *balija* being Spanish for an envelope. Clusius says he saw the C. lutea flowering by house-sides in Spain and Portugal, and that the inhabitants there use the seed for making their rosaries: in the East Indies the seeds are sometimes used as shot. The roots of C edulis are eaten, dressed in various ways, in Peru The seeds of most of the species are round, hard, black, shining, heavy, and about one sixteenth of an inch diameter These grow readily, or the plants may be propagated by dividing the roots, Miller recommends rich garden earth; Sweet (*Bot Cultiv* p 34) light rich soil for all the species. Most of these, if planted in a warm border early in summer, will flower there during the season.

2. *Maranta.* So named from Bartholomeo Maranti, a Venetian physician, who wrote three books chiefly to illustrate Dioscorides; died 1554. *Galangre*, Fr *Galgant*, Ger The M. arundinacea is called Indian arrow-root, because its thick fleshy root was thought to extract the poison from wounds inflicted by the poisoned arrows of the Indians. In the West Indies it is used as an alexipharmic, to resist the force of poisons;

Essential specific Character.

1 Inner limb of the corolla 3-fid, Seg. ovate equal sprdg. with long claws, Lip bifid, rev. Leaves ovate lanc
2 Inner limb of the corolla trifid, Segments lanceolate acuminate straight
3 Inner limb of the corolla trifid, Segments straight emarginate
4 Inner limb of the corolla bifid
5 Peduncle short inclosed in the upper leaf, Inner limb of the corolla trifid, Segments ovate lanceolate sub-erect, Lip erect spreading entire
6 Peduncles elong Inner limb of corolla 3fid, Seg lanceol. spathul. reflexed spreading, Lip oblong entire
7 Segments of cor. 2 entire ovate unequal, Lip bifid bent down
8 Segments of cor. 3 broad emarginate and crenate · the claws long, Lip. 2-fid bent down
9 Leaves of cal. lanceolate acute, Cor 5 parted, Leaves ovate-obl acute at both ends cordate
10 Leaves of cal. oblong obtuse, Cor 6 parted, Leaves ovate-obl acute at both ends cordate
11 Leaves sessile ovate with the sheaths and nerves very red, Inner limb 4 parted
12 Leaves smooth and stems colored at the base, Roots tuberous and large, Middle seg. of corolla very short
13 Flowers sessile in pairs, Segments of cor 2 erect bifid, Lip spotted revolute
14 Flowers on stalks: outer segments reflexed, inner 3 erect, Leaves lanceolate pointed at each end
15 Inner limb of the corolla trifid, Segments flaccid
16 Inner limb of the corolla trifid, Segments ovate straight, Lip three-lobed fringed.

17 Stem and Leaves beneath downy, sheaths curled and colored at the edge, Flowers cernuous



18 Culm branched herbaceous, Leaves ovate lanceolate somewhat hairy underneath
19 Leaves ellipt oblique at end, Spikes elong. in fasc. Bract. erect, 2-fid. imbricate acute pubesc
20 Culm branched knotty ovate smooth, Spikes terminal subternate, Bracteas colored
21 Stem knotty, Leaves lanc. narrow, Panicle wavy, Inner braits colored, Calyx ovate
22 Stem shrubby branching, Leaves ovate smooth
23 Leaves oblong lanc pubesc Fl. stalks 2-fid Germ very hairy
24 Stemless, Scape naked, Spikes comose, Bracteas reflexed

25 Flowers in dense heads shorter than the leaves which are striped with purple

26 Calyx two-flowered, Culm reedy powdered, Leaves ovate revolute at the apex

27 Stemless, Leaves radical
28 Shrubby, dichotomous, Leaves cordate

29 Leaves lanceolate, Spikes compact imbricated, Segments of the cleft lip of the corolla lunulate
30 Leaves linear lanc Spikes open, Fasc of flowers subtern Seg of cleft lip obl the other 5 segs. of cor. lin.
31 Leaves obl lanc. smooth, Spikes loose, Fascic tern 3 fid Inner segs. of the cor linear-cuneate, Lip bifid
32 Spike many-fl loose, Fascicles many-fl. distant, Lip obovate bifid, Filament colored longer than corolla
33 Leaves lanceolate, Spike loose ovate, Petals linear, Lip ovate 2-lob. Fil the same length as petals
34 Spathes truncate 1-fl. Outer segments of cor. linear, Lip roundish 2-lobed longer than the style
35 Leaves lanceolate, Spike terml open, Flowers sol scattered, Lip bifid sessile stigm ½-lanceol. Pet. linear
36 Leaves broad, Spike terml imbricate, Bract. 4-fl Cor with linear segm Lip obcordate retuse
37 Upper leaves wavy silky beneath, Spike loose conical, Filament much longer than corolla

and Miscellaneous Particulars

washed, pounded, and blanched, it makes a fine powder and starch, and may be used as food, resembling in many respects the salep. A light loamy soil suits all the species, which, though tender, are readily propagated by dividing the root.

3. *Calathea.* So named by Meyer, probably from the cup-like stigma of the genus. It is much admired on account of its singularly striped foliage, to which the specific name alludes, and its ovate spike of purple flowers, about the size of a large pine-cone

4 *Thalia.* In memory of John Thalius, a German physician, at Nordhuys, author of Plantæ Hercynæ, 1588. An aquatic, and if planted two or three feet under water, will survive our winters, in the open air. It flowers beautifully.

5 *Phrynium.* Φρυνος, a plant which grows in marshes, the habitation of frogs, from φρυνος, a frog. The leaves are used in Malabar and China, for wrapping up cakes in the oven; before expansion they infuse them in spirit of rice or sugar diluted with three times its quantity of water, to make vinegar. *Loureiro.*

6 *Hedychium.* From a Greek word signifying sweet, from the grateful odour it emits. This beautiful genus requires a light rich soil, and large pots to make the plants flower freely H. angustifolium deserves a place in every collection.

History, Use, Propagation, Culture,

7. *Roscoea* Named by Sir J. E. Smith, in honour of W. Roscoe, Esq, the accomplished historian of the Medicis, and the first botanist who elucidated the plants of the order Scitamineæ. The species are little known, but are both beautiful and curious

8. *Alpinia.* After Prosper Alpini, an Italian physician and botanist, who practised at Cairo between 1580 and 1584, and died in 1615. *Canne de Rivierre*, Fr. A splendid genus, requiring rich soil, a moist heat, and plenty of room. A racemosa answers best when treated as an aquatic.

9. *Hellenia* In honour of C. N. Hellenius, Professor at Abo, who, in 1798, published several academical dissertations The same culture answers this plant as recommended for Hedychium

10. *Zingiber.* From the original Indian appellation. *Zingembre*, Fr. *Ginfer*, Ger ; and *Zinzer*, Ital. Many of the specific names employed in the genus are derived from the vernacular names of the species. The roots of *Z. officinale*, and zerumbet, much used in the kitchen and in medicine, form a considerable export from our West India Islands. As a medicine, ginger is particularly useful in flatulent colic, debility, and laxity of the system, and in torpid and phlegmatic constitutions, to excite a brisker action of the vessels. The roots of ginger are taken up when the stalks fade, and, being first washed and scalded, are afterwards dried in the sun. This forms black ginger, the white sort is never scalded, but only washed and dried. When the root is to be

38 Flowers large terminal in the sheaths of the top of the stem, Leaves obl. acute sm.

39 Spike terminal comose, Bracteas colored longer than the flowers, Leaves oblong-ovate pubescent
40 Leaves sessile broad lanc Panicle terml. Lip obl unguiculated bifid, Caps. obov smooth, Seeds few
41 Lip trifid, Leaves ovate-lanc. apex revolute, Caps striated
42 Lip emarginate, Leaves lanceolate ovate very smooth [and bifid, Caps sphær open. on sides, Seeds few
43 Leaves lanc. short stkd. small, Rac. comp droop Lip broad 3-lob lateral incurv into a tube · external curled
44 Racemes terminal drooping, Lip bifid, Leaves lanc. acumin Margins rough with little spinous teeth
45 Leaves linear-lanc. polished, Spike compound erect, Lip ovate-obl. apex curled and bifid
46 Racemes spiked, Lip round und. 2-lob. Caps vill. Leaves obl. villous beneath
47 Racemes compound, Lip 3-lob no spur, Caps. berried, Leaves narrow shining
48 Scape radical compound flexuose procumbent, Lip 3-lob. calcarate
49 Spike terminal oblong compactly imbricated with narrow sharp bractes
50 Leaves bifar. very remote scape sheathed radical, Bracts dry pointed perm. Cor. tub. Lip included, Anth. sess
51 Nectary 2-leaved, Capsules spongy, Leaves smooth entire

52 Lip emarg Leaves and colored capsules smooth, Style hairy

53 Spikes radical, Leaves stalked broad smooth, Ligula large, Lip fiddle-shaped
54 Segments of the corolla concave acute equal, Lip ovate concave
55 Leaves sub-sessile linear-lanceolate smooth, Spikes elevated oblong, Bracteas acute, Lip 3-lobed
56 Stems decl Leaves bifar sess. lanc Spike long-ped. oval close obt Bract. broad obov obt margs col Lip 3-lob.
57 Stem erect, Leaves narr sess Spikes compact cone-shaped, Bracteas ovate-pointed, Lip 3-lobed
58 Spikes lat. Bracteas ovate col. Segm. of cor erect, Nect. 2-lob.
59 Spikes lat. Leaves short-stalked lanc Spikes lax ½ in the earth, Lip entire
60 Spikes lat. squarr ½ in the earth, Bract. narrow recurv. Lip 3-lobed

61 Nect. ovate entire, Leaves smooth on both sides
62 Nect. wavy sub-3-fid. Leaves pointed entire shining, Spike close
63 Nect. obsol. 3-lob. fringed wavy, Leaves silky beneath

64 Cal. short with 3 grnish. blunt teeth, Fil sm. at back, Leaves lanc hairy or sm Spike turb close, Br. obt herb

65 Nect. concave entire, Leaves long-ellipt. thick shining

66 Leaves rounded and stem very hairy, Flowers crisp

67 Dorsal segments of nectary lanc. acute frontal 2 part Segments obovate, Leaves oblong colored beneath
68 Dorsal segments of nect. obtuse obsoletely 3-lobed frontal 2-lobed wavy, Leaves ovate pale beneath
69 Dorsal segments of nect linear obtuse frontal emarg Leaves lanc pale beneath
70 Leaves stalked broad lanc smooth, Spike central, Cor with inferior segment very large and panduriform
71 Leaves orbiculate ovate wavy woolly beneath
72 Leaves oval, Spike central, Anther crest jagged

73 Scape very short, Flowers heaped, Leaves distant ovate acum. entire smooth
74 Scape short, Flowers numerous close, Sterile stem simple, Leaves ellipt. lanc pointed
75 Scape naked very short, Spike capitate, Leaves linear lanceolate
76 Scape branching lax, Leaves ovate
77 Leaves broad villous beneath, Spikes radical, Lip round oval, Crest broad truncated, Caps. 9 winged
78 Scape naked, Spike elong Bract. inflated, Leaves broad lanceol.
79 Leaves lanceol smooth, Spikes obovate echinated, Lip oblong

and Miscellaneous Particulars

preserved in syrup, it is taken up and scalded before fully grown After steeping and washing in water, it is put in jars, and covered with a thin syrup (Browne's Jamaica.) Z. zerumbet is used in the East in cataplasms and fomentations, but not as internal medicine.

11. *Costus* From its name in Arabic, *gosth* Jacquin has shewn that the *costus* of the moderns is not the same as the plant so called by the ancients. *Costwurtz*, Ger., and *costo*, Ital. All the species grow in woods in their native countries, and their roots partake somewhat of the qualities of ginger.

12 *Kæmpferia* In honor of Engelbert Kæmpfer, the Japanese traveller, born in Lemgow in Westphalia in 1651; died in 1716. *Zedoaire*, Fr. and *Grosse Galgant*, Ger. This is a curious genus of low stemless plants, with tuberous roots, a pleasant aromatic smell, and sharpish taste. The root is purple without and white within, and is esteemed a stomachic and cephalic. When the plants are not in a growing state, they require little or no water; otherwise like bulbs which are kept always moist, they will not flower freely.

13. *Amomum* From *a*, privative, and *μασσω*, impurity, it has always been esteemed a powerful counter poison; or perhaps a corruption of *phamámá*, the Arabic appellation of the plant. *L'amome des pédes*, Fr. *Ingwer* and *Gengiowo*, Ital. Most of the species formerly included under this genus are placed by Roscoe under Zingiber.

History, Use, Propagation, Culture,

14. *Curcuma.* From the Arabic *kurkum* or *hercum Babilonischer safran*, Ger C. longa was formerly much used in cookery to give things a color, and is still so used in the East Indies, for dyeing The root was reputed aperient and resolvent, and was given in jaundice · it tinges the urine of a deep yellow. The roots of C. zerumbet powdered and mixed with the powdered wood of Cæsalpinia Sappan is copiously thrown about by the Hindoos during their holidays in March. The tubers of many species yield a very beautiful pure starch like arrowroot, which in some places, especially Travancore, forms a large part of the diet of the inhabitants.

15. *Globba.* Its Indian name, and that also by which it is known in the Moluccas *Globée*, Fr Most of the species produce spikes of smoky-colored berries about the size of grapes, and which are sometimes eaten.

16. *Mantisia.* The flowers bear a singular resemblance to some of the insects called mantis. The name of the species is derived from a fanciful notion that the flowers are like a dancing figure attached to a wire.

17. *Philydrum.* Φιλεω and ὑδωρ, a lover of water, in allusion to the places in which it grows. A pretty biennial plant, requiring but little protection from frost.

18. *Lopezia.* Dedicated by Cavanilles to the memory of the licentiate Thomas Lopez, a Spanish botanist, who is said to have directed his attention to the natural history of the New World. The species are chiefly elegant annuals, and well deserving of cultivation.

19. *Boerhaavia.* So named in honor of the famous Boerhaave of Leyden, born at Voorhoot in 1668, and died

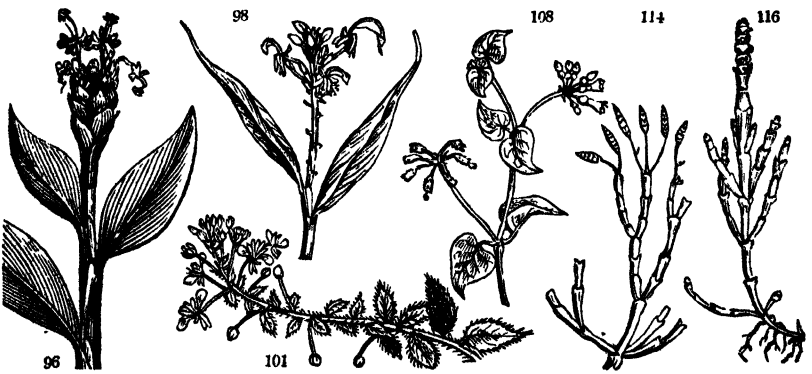
90 Spikes lateral, Bulbs small with long palm tub. yell. inside, Leaves broad sessile silky beneath all green
91 Spikes lat. Tub palm. pale straw-col Leaves gr stalk. brd with a pur. cloud down the mid. Fl. short. than brac.
92 Spikes lateral, Roots æruginous within, Leaves stalked with a faint rusty cloud beyond their middle above
93 Spikes lat. Roots pearl col. inside, Leaves broad on winged red stalks above the sheaths: rib and scape red
94 Spikes lateral, Roots green inside palmate, Leaves narr with a rusty cloud in middle
95 Spikes lateral clavate comose, Roots ovate pale yell inside, Leaves all green
96 Spikes lateral, Tubers large incurved pale yellow, Leaves sessile villous beneath all green
97 Spikes lat Roots palm. scented pale yell. inside palmd. Leaves and sheath rusty with a pale red spot in mid.
98 Spikes lat. few-flowered comose, Tubers long spreading pale inside, Leaves smooth pure green
99 Spikes lat. Tubers all yellow, Leaves sessile green broad with a purple cloud down the middle
90 Spikes lat. Leaves stalked oblong with red sheaths
91 Spikes lat. Root with pale pendulous tubers, Leaves stalked narrow, Flowers longer than bractes
92 Spikes central, Tubers palmate deep yellow, Leaves long stalked broad-lanceolate, Plant all green
93 Spikes central, Leaves on long stalks cordate, Coma lilac
94 Spikes central few-flowered, Tubers palmate pale yellow inside, Leaves broad smooth on long stalks
95 Spikes central, Roots deep orange inside, Leaves long stalked broad green

96 Leaves lanceolate, Spike terminal sub-sessile cone-shaped bulbiferous, Anther 4-horned
97 Spike whorled, Lateral segments of cor longest, Appendage cordate, Bractes lanc. withering, Bulbiferous
98 Leaves ovate lanc. villous beneath, Racemes compound term. bulbif Anther naked roundish

99 The only species

100 Flowers bright yellow, Leaves hairy

101 Leaves ovate villous, Stem round
102 Leaves ovate attenuate at base, with the 4-cornered stem smooth
103 Leaves shining, Stems angular, from the decurrent stalks, Corymbs leafy at the base
104 Leaves roundish cordate ciliated smooth, Branches angular



105 Stem 4-cornered smooth, Joints clammy, Flowers panicled, Leaves angular dotted with black beneath
106 Stem round pubescent, Flowers in capitate corymbs
107 Stem roundish hairy, Leaves ovate acute sub-repand, Flowers in heads diandrous
108 Stem climbing, Leaves all cordate, Flowers in umbels diandrous
109 Villous viscid, Leaves ovate acute sub-repand, Stem procumbent, Flowers in heads triandrous

110 Leaves entire lanceolate, Stem ½-shrubby at base, Flowers corymbose, Stamens nearly twice as long as cor
111 Leaves linear, Stem herbaceous, Flowers corymbose, Stamens nearly thrice as long as corolla
112 Rad. leaves ovate cauline pinnatifid, Stem upright smooth, Flowers panicled

113 Stems branching declining, Flowers minute sessile in axillary heads

114 Leaves alternate sheathing obtuse gaping on one side
115 Stem erect shrubby, Joints of the young branches 2-sided, Scales of flowers truncate membranous
116 Stem shrubby procumb. rooting, Joints compressed emarg cylindr Spikes obl Style deeply divided, Stam 2
117 Herbaceous spreading, Joints emarginate compressed at end, Spikes axillary opp stalked, Scales blunt
118 Herbaceous procumbent, Joints obconic, Branches simp Spikes fastigiate, Stamens 2

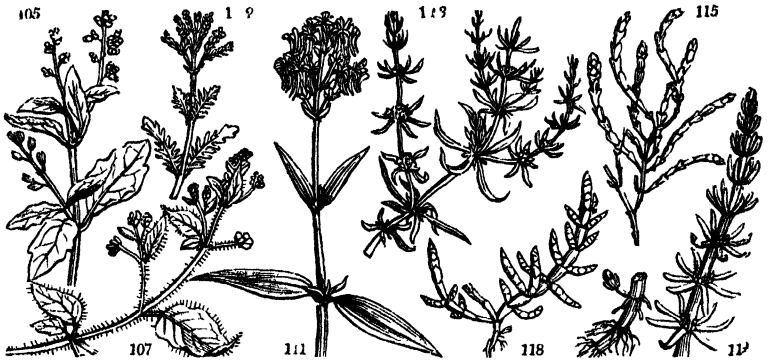
119 Leaves whorled 10-12 linear acute

and Miscellaneous Particulars

in 1759 *La Tassole*, Fr He was the first friend and protector of Linnæus. All the plants of this genus are possessed of little beauty.

20. *Centranthus* From κεντρον, a spur, and ανθος, a flower, in allusion to the calcarate corolla.

21. *Pollichia.* In honor of Jean Ad. Pollich, a German botanist, who published in 1776, a history of the plants of the Palatinate. The only species is an obscure herbaceous plant.



22. *Salicornia.* From sal, salt, and cornu, a horn, saltwort, marsh samphire. *Le Christemarine*, Fr *Glass schmaltz*, Ger., and *Erba-cali*, Ital. S. herbacea is gathered when in flower, and pickled in salt and vinegar like samphire, for culinary purposes. The whole plant has a saltish taste, and is greedily devoured by cattle. All the species, excepting the S. arabica, abound on the shores of the Mediterranean, and are there burnt for soda, which is much used in the manufactures of soap and glass, especially at Marseilles.

23. *Hippuris* From ἱππος, a horse, and ὐρα, a tail. *La Peese d'eau, ou pin aquatic*. Fr *Schaftholm*, Ger., and *Hippuride*, Ital The flower of this plant is one of the simplest among perfect plants, it has only one stamen and one pistil, unprotected by either calyx or corolla, and it produces only one seed The situation of the leaves in whorls is not usual in European plants, excepting in the stellatæ of Linnæus. The flowers in the beginning of summer are mostly hermaphrodite, but in autumn many of them are female By absorbing a great quantity of inflammable air, this plant is reputed to assist in purifying the putrid air of marshes. It is eaten by wild ducks.

History, Use, Propagation, Culture,

24. *Zostera.* From ζωστηρ, a riband; the leaves of Z oceanica are a foot long and an inch broad, resembling a riband. *La Zostére*, Fr, and *Seetang*, Ger This plant abounds on the coast of Yarmouth, where it is thrown on shore in such abundance that mounds are made with it to enclose the encroachments of the sea. It is also used as thatch, and said to endure for upwards of a century; by exposure it bleaches white In Sweden and Holland it is used as a manure, and is preferred to hay for stuffing beds Horses and swine eat it, but cows are not fond of it The rush-like envelopes of Italian liquor-flasks are prepared from this plant

25. *Chloranthus* So named from χλοεος, green, and ἀνθος, a flower, on account of the greenish hue of its inconspicuous inflorescence The structure of the flower is very curious, and so anomalous, as to render it difficult to tell to what class of Linnæus it is referable For further remarks upon this subject, see Mr. Lindley's *Collectanea Botanica*, p 17

26. *Corispermum* From κορις, a bug or tick, and σπερμα, a seed *Le Corrisperme*, Fr, and *Der Wanzen-*

Class II. — DIANDRIA. 2 Stamens.

This class, which is not large, and so entirely artificial that no other characters than those of the Linnæan definition can be assigned to it, contains some elegant and fragrant plants belonging to Jasmineæ, Scrophularineæ, and Labiatæ. examples of the two latter orders are Veronica and Salvia, extensive genera chiefly of hardy herbaceous plants The most useful of the class are the pepper and the olive the jasmine is used in perfumery, the sage and rosemary in cookery, and the privet and syringa for garden hedges One or two species are employed in medicine, several are border flowers; but the greater number of the class are plants of curiosity.

Cedarium is a leguminous plant, and is widely removed from its natural place, which is Diadelphia; so are Salvia, Monarda, Rosmarinus, Veronica, and many others, which would have been naturally referred to Didynamia.

Under this class Persoon has placed the genus Gunnera, which Willdenow injudiciously referred to Gynandria. A great variety of diandrous plants are scattered through the other classes of Linnæus, but as such plants are chiefly, with the exception, perhaps, of grasses, diandrous, on account of the incomplete formation of some of their stamens, the rudiments of which are usually obvious, it is scarcely necessary to particularise more than the following, viz :—

D. MONOGYNIA Viola diandra, Salicornia herbacea, virginica; Anychia dichotoma; several species of Boerhaavia. D. DIGYNIA. Polycnemum salsum, Bufonia tenuifolia. D TRIGYNIA. Holosteum diandrum.

Order 1. MONOGYNIA.  2 Stamens. 1 Style.

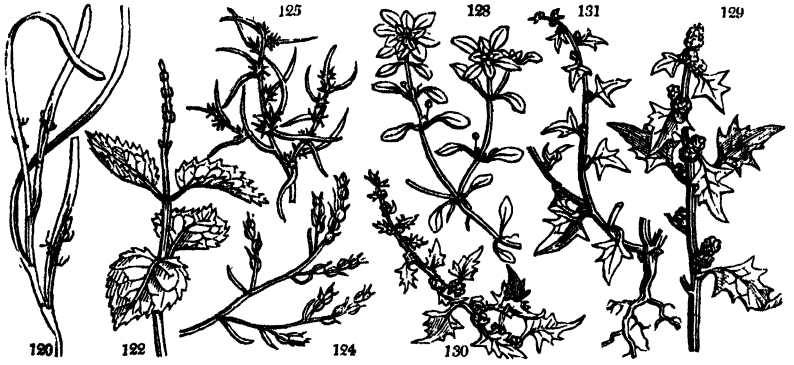
§ 1 *Flowers complete, inferior, monopetalous, regular.*

30. *Cedarium.* Cal. 5-cut, with a persistent tube Cor flattish Legumen one-seeded, filled with a soft fæcula.

31. *Maytenus.* Cal. 5 lobed Cor campanulate, entire. Caps compressed, 2-valved, with 2 cells, and 2 seeds.

120 Leaves entire somewhat 3-nerved, Stems nearly round

121 Spikes compound, Stem decumbent
122 Spike simple solitary, Stem upright
123 Spikes 2-4 simple, Stem upright, Leaves thick



DIGYNIA.

124 Spikes terminal, Flowers distant, Leaves nerveless and bractes unarmed
125 Spikes axillary, Flowers close imbricat. Leaves nerveless and bractes mucronate pungent
126 Spikes terminal, Flowers becoming remote, Leaves nerveless and bractes pungent, Fruit incurved
127 Spikes terminal and axillary, Flowers imbricate, Leaves and bractes mucronate, Stem villous

128 A small floating plant resembling Lemna

129 Heads in terminal spikes
130 Heads lateral scattered
131 Heads axillary small not juicy, Stem very branching

132 A stinging twining perennial plant

and Miscellaneous Particulars.

same, Ger. The species abound in the south of Russia in marshy steppes with Salsola and Atriplex. Round the Caspian sea they grow six feet high, are red in winter, and eaten by camels

27. *Callitriche* From καλλος or καλος, and θριξ, hair *Le Callitrice*, Fr. *Der Wasserstern*, Ger, and *Callitrica*, Ital. A little aquatic plant, liable to variation in its appearance; on which account some botanists have divided it into several species.

28 *Blitum.* From βλιτον, insipid, or, according to Dr. Theis, from the Celtic *blith*, which has the same import. *Le Blète*, Fr. *Die Beermelde*, Ger, and *Blito*, Ital After the flowers are past, the heads swell to the size of wood-strawberries, and when ripe have the same color and appearance They are succulent, stain the hands, and were formerly used by cooks for coloring puddings Some consider the B virgatum as only a variety of the other

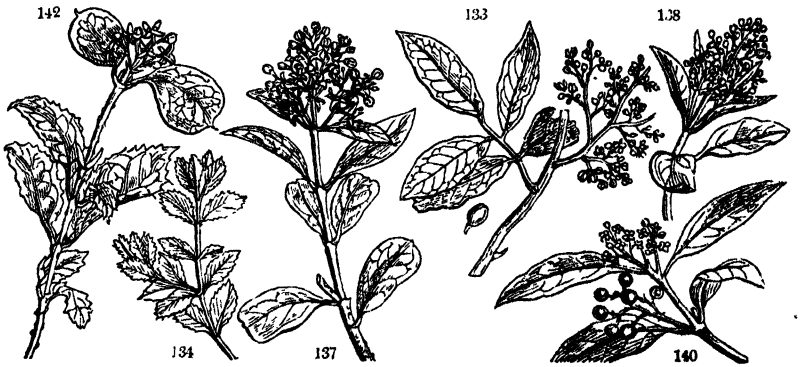
29. *Aspicarpa* From ασπις, a round shield, and καρπος, fruit, in reference to the form of the ripe fruit.

---

32. *Olea* Cor. 4-cleft. Segments subovate Drupe one-seeded.
33. *Phillyrea.* Cor. 4-cleft. Berry one-seeded.
34. *Chionanthus* Cor. 4-cleft. Segments very long Drupe one-seeded, with a furrowed nut
35. *Notelæa* Cal. 4-toothed. Cor 4 short oval petals united by the base of the stamens Filaments 4-horned. Style 0. Stigma bifid. Drupe with a papery putamen.
36. *Ligustrum.* Cor. 4-cleft. Berry 4-seeded
37. *Syringa.* Cor. 4-cleft Capsule of two cells
38. *Nyctanthes.* Cor. 4-cleft. Segments truncated. Caps. with two cells edged Seeds solitary
39. *Jasminum.* Cor 5 or 8-cleft Berry with two divisions. Seeds solitary with an arillus.

§ 2. *Flowers complete, inferior, monopetalous, irregular*

40. *Veronica.* Cor 4-cleft: limb flattish; the lowest segment the narrowest. Capsule 2-celled.
41. *Galipea.* Cor 4 or 5-cleft, hypocrateriform. Stam. 4 2-sterile.
42. *Schwenkia.* Cor. nearly equal: the orifice plaited, stellate, and glandular. Stam. 5: 3-sterile Capsule 2-celled.
43. *Gratiola.* Cor. 4-cleft, 2-lipped, resupinate Stamens 4: 2-sterile. Caps 2-celled.
44. *Schizanthus* Cal 5-parted. Cor 2-lipped resupinate: the upper lip 5-parted, the lower 3-parted Stam. 4, 2-sterile. Caps. 2-valved, 2-celled.
45. *Elytraria.* Cal 4-5-parted. Cor. 5-cleft, nearly equal. Caps. 2-valved, 2-celled. Seeds attached below to a dissepiment contrary to the valves
46. *Hypoestes.* Cal. 5-cleft equal, with a 4-cleft 3-flowered involucrum. Cor. 2-lipped. Stamens 2. Anthers 1-celled. Seeds fixed by little hooks.
47. *Justicia.* Cal. 5-parted equal. Cor. 2-lipped or ringent: the lower lip divided. Anthers 2-celled. Seeds attached by little hooks.
48. *Dicliptera.* Cal. 5-parted. Cor. bilabiate. Caps. with two elastic valves, 1 2-celled, the dissepiment retaining the seeds by its inflexed toothed edge
49. *Eranthemum.* Cal. 5-parted. Cor. 5-cleft, with the tube curved in the middle. Caps. many seeded.
50. *Wulfenia.* Cor. 4-cleft: smooth bearded. Cal 5-parted. Caps. 2-celled.
51. *Calceolaria.* Cor. ringent, inflated. Cal. 4-cleft. Caps. 2-celled, 4-valved.
52. *Pinguicula.* Cor. ringent, spurred. Cal. 5-cleft. Caps. 1-celled.
53. *Utricularia.* Cor. ringent, spurred Cal 2-leaved. Caps. 1-celled.



54. *Stachytarpheta.* Cal. tubular, 4-toothed. Cor. hypocrateriform, unequal, 5-cleft, curved. Stam. 4: 2 sterile Seeds two.
55 *Lycopus* Cor 4-cleft, nearly equal, with one segment emarginate. Stamens distant. Seeds naked.
56. *Amethystea.* Cor 5-cleft, nearly equal, with the lowest segment concave. Stamens near each other. Seeds naked.
57. *Ziziphora* Cal. cylindrical with ten lines, somewhat 2-lipped, 5-toothed, closed with hairs. Cor. 2-lipped. Seeds 4 naked.
58. *Cunila* Cal. oblong, 5-toothed, closed with hairs. Cor 2-lipped. Seeds 4 naked.
59. *Hedeoma.* Cal 2-lipped, gibbous at the base Cor ringent. Stamens 4: 2 sterile.
60. *Monarda.* Cor. ringent. helmet linear, wrapping up the anthers Seeds naked.
61 *Rosmarinus* Cor ringent. Helmet arched, bifid. Stamens curved, with a tooth. Seeds naked.
62. *Salvia* Cor ringent Filaments stalked cross-wise. Seeds naked.
63. *Collinsonia.* Cor somewhat ringent the lip very finely divided. Seeds naked.
64 *Catalpa* Cor 5-cleft, irregular Cal 2-parted. Stam. 3 sterile. Caps. 2-celled. Seeds at each end with a membranous pappus
65. *Ghinsa.* Cor ringent. Cal. with 5 bristles. Fruit, a fleshy 4-celled nut.

§ 9 *Flowers complete, inferior, polypetalous.*

66 *Fontanesia* Cor with 2 petals Cal 4-parted Caps. 2-celled, not opening.
67 *Linociera* Cor with 4 petals Cal 4-toothed. Berry with 2 cells
68 *Ancistrum* Cal 1-leaved, armed with barbed spines. Cor. 4 petals inserted into edge of calyx. Stam. 2-4-5. Stigm. finely divided Seed one, inclosed in the calyx.

History, Use, Propagation, Culture,

30 *Codarium* So named by Dr Afzelius, from κωδαξιον, a leathern pouch, in allusion to the pods of the tree. These are filled with an abundant pithy fæcula, which is eaten by the inhabitants of the coast of Guinea, where the fruit is called wild tamarinds

31 *Maytenus* The barbarous name of the shrub, and applied as a generic name by Molina. It has the habit of a Rhamnus, and will probably form an hardy inhabitant of our gardens.

32. *Olea* From ελαια, the Greek name for the plant, a word derived in its turn, as De Théis conjectures, from the Celtic *olew*, oil. Olea is commonly put for the tree, oliva, for the fruit; and oleum, for the juice of the fruit. *L'olivier*, Fr. *Oelbaum*, Ger, and *Ulivo*, Ital. The cultivated olive came originally from Asia, and grows abundantly about Aleppo and Lebanon, it is naturalised in different parts of the south of France, Spain, and Italy, and found in hedges and woods, but the fruit of that kind is small and of no use. O e var. longifolia, is the variety chiefly cultivated in the south of France and in Italy O e. var latifolia, is chiefly cultivated in Spain, its fruit is near twice the size of the common olive of Provence or Italy, but the oil is so rank of flavor as to be too strong for most English palates The oil and fruit, in a pickled state, are sent chiefly from Languedoc, Leghorn, and Naples to England, the best oil is from Leghorn, and the best pickles from Genoa and Marseilles The tree seldom exceeds thirty feet in height, is branchy, glaucous, evergreen; and of so great longevity, that some plantations in Italy, as at Terni, are supposed to have existed from the time of Pliny. The tree delights in schistous, calcareous steeps, and does not thrive in elevated situations, or at a distance from the sea. The best oil is produced from fruit grown in calcareous soils Olive oil may be said to form the cream and butter of Spain and Italy; and the tree has been celebrated in all ages as the bounteous gift of heaven, and as the emblem of peace and plenty.

Olive oil is made by crushing the fruit to a paste, then pressing it through a woollen bag, adding hot water as long as any oil is produced. The oil is afterwards skimmed off the water, and put in tubs, barrels, and bottles for use The best olive oil is of a bright pale-amber color without smell, and bland to the taste. Kept warm, it becomes rancid, and it freezes at 38° Fah. It is of the same nature with all mild expressed vegetable oils, of these the most fluid are preferred, and hence the oils of olives and almonds are those chiefly used in medicine. Oily substances do not unite with the contents of acid stomachs, but to healthy patients they afford much

69 *Ornus.* Cal. 4-parted. Cor of 4 petals. Fruit, a winged Samara of two cells.

§ 10. *Flowers complete, superior.*

70. *Morina.* Cal. of the fruit toothed with bristles · of the flower bifid.
71 *Circæa.* Cal 2-leaved Cor. with two obcordate petals.
72. *Fedia* Caps. 3-locular, crowned with the upright (not involute) limb of the calyx. Corolla irregular.

§ 11. *Flowers incomplete, with no corolla.*

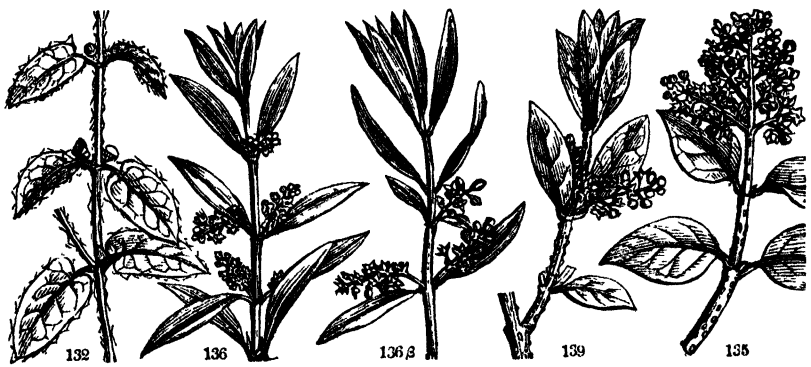
73. *Pimelea.* Cal. funnel-shaped, with a 4-cleft limb Stigma capitate.
74 *Cladium.* Cal. many-valved, 1-flowered: valves glumaceous, imbricated, the exterior smallest. Nut with a double coat.

Order 2. DIGYNIA.  2 Stamens. 2 Styles.

75 *Gunnera* Cor O Cal 2-toothed. Seed one, inclosed in a tough coat
76 *Anthoxanthum.* Glume membranous, 3-flowered. Lateral florets neuter with one palea bearded, intermediate floret hermaphrodite, much shorter than the lateral ones. Paleæ obtuse, beardless. Seed free.

Order 3 TRIGYNIA.  2 Stamens. 3 Styles.

77 *Piper.* Cal. O. Cor. O. Berry 1-seeded. Spadix simple, slender, covered with little flower-bearing scales



MONOGYNIA.

133 Leaves unequally pinnate, Leaflets oval acute the inner the smallest

134 Leaves sessile two inches long opposite or alternate oblong smooth serrated

135 Leaves oblong pointed entire the young ones only hoary beneath, Branches spiny
136 Leaves lanceolate pointed entire hoary beneath, Branches angular not spiny
- β Leaves linear-lanceolate flat silky beneath
- γ Leaves oblong flat hoary beneath
- δ Leaves narrow acute at each end, rusty beneath
- ε Leaves oblong bent obliquely pale beneath
- ζ Leaves oblong ovate, Branches divaricate

137 Leaves oblong, Flowers racemose panicled terminal
138 Leaves elliptical wavy, Stalks of leaves green
139 Leaves lanceolate flat white beneath, Branches warted
140 Leaves elliptic-lanceolate, Bractes all persistent connate ovate, Racemes sub-compound narrow
141 Leaves elliptic acute, Bractes perfoliate the lower cup-shaped persistent the upper large leafy deciduous
142 Leaves elliptic-lanceolate sub-serrate, Flowers single lateral in bunches

and Miscellaneous Particulars.

nourishment, and medicinally are supposed to correct acrimony, to lubricate, and relax Olive oil is applied externally to bites and stings of poisonous animals, and to burns alone, with chalk, or in liniments and poultices. The ancients rubbed their bodies with it in dropsies and for various purposes; but it is now little used excepting for coughs and in worm cases.

Pickled olives are prepared from unripe fruit by repeatedly steeping them in water, to which quicklime or any alkaline substance is sometimes added to shorten the operation Afterwards they are soaked in pure water, and then taken out and bottled in salt and water, with or without an aromatic They are eaten abroad as a whet before and during the principal meals, and in this country chiefly at the dessert. They are supposed to excite appetite and promote digestion. The finest kind of the prepared fruit is called by the merchants *Picholine*, after one Picholini, an Italian, who first discovered the art of pickling olives.

The culture of the olive abroad may be said to resemble that of grass orchards in Britain. It is propagated by suckers, large cuttings, or truncheons planted in trenches four feet deep, into which it is still the custom to deposit stones for encouraging moisture about the roots, as described by Virgil (*Georg* II. 346.) It is also propagated by chips of the stool, in the following manner. An old tree is cut down, and the ceppo, or stock, is cut into pieces of nearly the size and shape of a mushroom, and which, from that circumstance, are called uovoli Care is taken that each uovolo shall have a small portion of bark. After being dipped in manure, the uovoli are planted thick in a bed and covered with earth to the depth of three inches; they soon throw up shoots, and are transplanted at the end of one year, and in three more are fit to be finally removed to the olive plantation.

The olive in Britain grows readily by cuttings, or may be grafted on the privet. With protection during frost, it may be maintained against a wall in the latitude of London Some trees so treated, produced a crop in the garden of Camden House, Kensington, in 1719, and in Devonshire, some trees have stood the winter for many years as standards, though without ripening their fruit. Large plants are frequently imported from Genoa, along with orange and pomegranate trees.

O fragrans is highly odoriferous both in the leaves and blossoms; the plant is much esteemed on that account in China, and the leaves used at once to adulterate and flavor teas.

History, Use, Propagation, Culture,

33 *Phillyrea* Said to derive its name from φυλλον, a leaf, an etymology far from satisfactory. The genus consists of ornamental evergreen shrubs, the supposed varieties of which have been considered distinct species by most modern botanists Some authors have united the genus with Olea; but they have not been followed generally

34. *Chionanthus* From χιον, snow, and ανθος, a flower. *Le Chionanthe*, Fr *Der Schneeblume*, Ger, and *Albero de neve*, Ital. Both species are highly ornamental shrubs or low trees; their leaves are above half a foot in length, and 1½ inch in breadth, their flowers white, in numerous long bunches, and their fruit of the size and color of a sloe They are propagated by seeds or grafting on the common ash

35. *Notelæa.* From νοτος, south, and ελαια, olive, the olive of the south A small ornamental genus of nearly hardy shrubs, which would probably endure the climate of this country in a favorable situation.

36. *Ligustrum.* From ligare, *to tie*, on account of its long pliable branches *La Troëne*, Fr *Der Liguster*, Ger, and *Legustro*, Ital. The privet in old authors is called primprivet, as Professor Martyn conjectures, from its patience under the shears Few shrubs exceed it as a garden hedge-plant. it will thrive in the middle of coal-burning cities, in the shade, and under the drip of trees, though to flower well it requires an open airy situation. Cows, sheep, and goats eat it, but horses refuse it.

The Sphinx ligustri, *L*, or privet hawkmoth, and Phalæna syringaria feed on it in the caterpillar state: the blister beetle, Lytta vesicatoria, from which cantharides is formed, is also found on it Fully grown, the wood is fit for the turner, and a rose-colored pigment may be prepared from the berries, which, with alum, dye wool and silk of a durable green. The berries remain on the tree during winter in elegant purple clusters, and are not eaten by birds excepting in very severe weather, when bullfinches and some others feed on them. Like most plants that have been long in cultivation, the privet varies in its leaves, flowers, and fruit, and in the duration of the former. In its cultivated state it is always evergreen; found wild in woods and hedges, is ge-

148 Leaves linear lanceolate entire

144 Leaves lanceolate entire or serrate in the middle, Leaves 3-nerved

145 Leaves oblong lanceolate sub-serrate in the middle obsoletely veined, Branches erect
146 Leaves oblong lanceolate acute obsoletely serrated at the point veiny, Branches veiny
147 Leaves oblong lanceolate nearly entire obtuse narrowed at the base veiny
148 Leaves elliptic oblong nearly entire veiny somewhat obtuse
149 Leaves ovate oblong rounded at the base veiny serrated, Serratures with stiff points
150 Leaves ovate rounded at the base serrated acute veiny
151 Leaves oblong serrated acute at each end veiny

152 Racemes terminal, Stalks 3-flowered, Petals linear lanceolate, Leaves coriaceous
153 Leaves obovate lanceolate membranaceous pubescent, Panicles very lax, Fruit elliptic
154 Spikes axillary very short, Leaves oblong elliptic acute

155 Leaves lanceolate pointed sub-reclinate, Racemes length of the leaf-stalks
156 Leaves lanceolate acute sub-erect, Racemes as long as the leaves
157 Leaves opposite rigid broad lanceolate entire, Bunches axillary

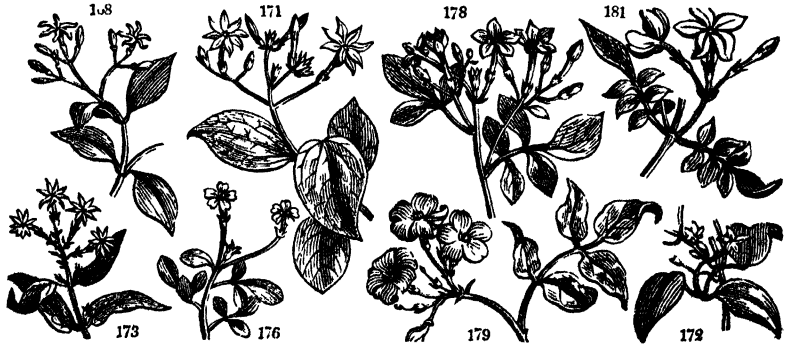
and Miscellaneous Particulars

nerally deciduous. Sometimes the leaves grow by threes, are enlarged at the base and variegated The regular number of stamens is two; but sometimes there are three or four in a flower The berries are usually purple or black, but some have been seen of a white color; and a yellow fruited variety is common in the gardens. A kind of vegetable wax is said to be obtained from L. lucidum in China.

37 *Syringa* Some say from Συριγξ, an Arcadian nymph, or, more properly, here, a pipe The tubes of the finest Turkish pipes are manufactured from the wood of it; but the true root of the word is to be found in *surinz*, its native name in Barbary. Lilac is a Persian word signifying a flower. *Le Lilas*, Fr. *Die Spreue*, Ger., and *Syringa*, Ital. All the species are most beautiful flowering shrubs, readily propagated by suckers, which they throw up in abundance The common lilac seems to have been introduced before or during the reign of Henry VIII.; for in the inventory taken by order of Cromwell of the articles in the gardens of the palace of Nonsuch, are mentioned six lilackes; trees which bear no fruit, but only a pleasant smell. S. persica is well adapted for forcing in pots; but so treated its flowers are without fragrance.



38. *Nyctanthes* From νυξ, night, and ανθος, flower, night-flower, its flowers expanding and smelling only in the night. *L Arbor triste*, Fr. *Der Trauerige baum*, Ger. It grows freely in loam and peat soil mixed, but seldom produces its exquisitely fragrant flowers in England. Sweet thinks it is generally kept too warm, and recommends a trial in the greenhouse or open air, but its appearance would probably be little improved by any manner of treatment, as it has but an indifferent aspect in its own country. Cuttings not too ripe, root readily in sand under a hand-glass

39. *Jasminum* From the Arabian jasmin (yasmyn). Linnæus obtained a fanciful etymology from ια, a violet, and οσμη, smell *Le Jasmine*, Fr *Der Schasmine*, Ger, and *Il Gelsomino*, Ital The flowers of *J sambac* are of exquisite fragrance, and in high esteem both in the East and West Indies It grew in the Hampton Court garden at the end of the 17th century; but being lost there, was known in Europe only in the garden of

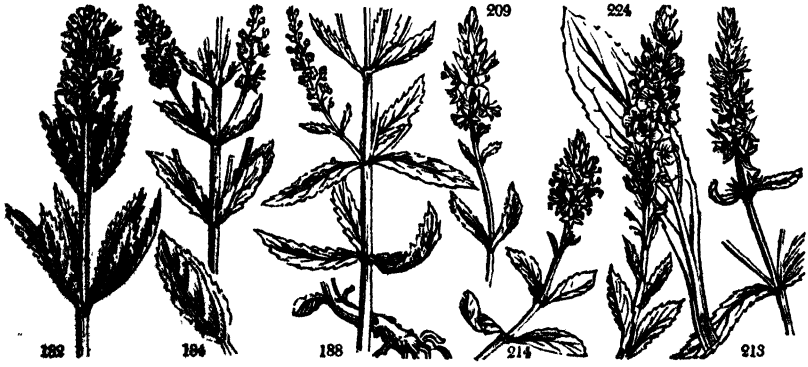
History, Use, Propagation, Culture,

the Grand Duke of Tuscany at Pisa, where Evelyn informs us (*Memoirs*, &c. by Bray), the plant was placed under guard that no cuttings might be purloined. A plant sent to Miller in 1730 restored it to England, and it is now a common greenhouse shrub Plants of J humile, also very odoriferous, are commonly imported from Genoa along with orange-trees J officinale has been a favorite wall-shrub from time immemorial. Its native country, as well as the date of its introduction are unknown. Gerarde, in 1597, says it was in common use for covering arbors. J hirsutum is a tall tree, whose sweet-smelling flowers open during the night and fade at sun-

168 Leaves opposite simple ovate ellipt. Calyx smooth campanulate · teeth very short
169 Leaves lanceolate mucronate sub-coriaceous, Flowers 3 terminal
170 Leaves polished 3-nerved pointed, Fl. sol. Cal. 6.7 toothed, Cor 6.8 part. Seg. fillf. longer than the long tube
171 Spreading, Leaves obl. polished, Flowers 3 or many term Cor. 6.8 part. Segm. linear acute equal to tube
172 Erect every part polished, Leaves ternate oval obtusely acuminate, Panicles terminal
173 Leaves simple cordate obl. shining, Branches and flower-stalks hairy, Racemes 3-flow. Calyx-teeth straight
174 Leaves sub-ternate, Leaflets ovate the pair minute or wanting, Teeth of cal. 5 gland Cor 7 part Berr glob.
175 Leaves compound ternate ovate and sub-cordate, Calyx campan. smooth, Segm. of corolla equal to its tube
176 Leaves alternate ternate and simple, Leaflets sub-cuneate, Calyx-teeth subulate
177 Leaves alternate acute ternate and pinnate, Branches angular, Calyx-teeth very short
178 Leaves alternate obtuse ternate and pinnate, Branches slender, Calyx-teeth very short
179 Leaves in about 3 pairs ovate lanc. on short stalks, Cym. term. few or many-fl loose, Anth. mucr. partly exsert.
180 Leaves pinnate acuminate, Buds upright
181 Leaves opposite pinnate exterior 3 or 5 leaflets confluent, Flowers terminal, Buds horizontal

Racemes or Spikes terminal, Leaves whorled and opposite.



182 Leaves 5 6 or 9 together lanceolate sessile
183 Leaves 4 5 together lanceolate ovate stalked, Flowers cylindrical

184 Leaves 3 or 4 together ovate or ovate-lanceolate sub-biserrate ; serratures unequal
185 Leaves ternate and opposite obl.-lanc. serrate, Cal. acute, Cor. notched. [equal shorter than capsule
186 Leaves 3 or 4 togeth. lin. lanc. from an ov. base acumin. deeply doubly serr with the stem sub-pub Cal. nearly
187 Leaves opp. linear narrowed by degrees very acute remotely serrated, Bractes longer than the flower-stalks
188 Leaves 3 or 4 together nearly sessile lanceolate simply serrate, serratures equal
189 Leaves narrow lanc. remotely serr or lin and very ent. Bract much longer than fl.-stalks, Stem ascending
190 Spikes lateral short nodding, Leaves opp folded together toothed : teeth thick, Segments of corolla entire
191 Leaves lan. lin narr. by deg. to very end finely serr the serrat at base of leaf deep. Bract. longer than flower-st
192 Leaves sub-sess. ovate acute serrated pubes Flower bearing branches in bundles, Flow sub-sess. very small
193 Leaves opp. 3 togeth. sub-cord. lanc. simply serrated with the stem smooth, Serratures remote nearly equal

194 Stem pubes. Leaves opp. and tern lanc. rather fleshy simply and remotely serrate wedge-shaped at the base
195 All over slightly pubes. Leaves 3 togeth lanc acumin sub-cord at base doubly serrate serrat. of base deepest
196 Leaves very long almost coriaceous opp or 3 together on short stalks cordate at base acutely and unequally dentate serrate hanging down
197 Leaves lanceolate acute simply serrate entire at the end, Serratures distant simple equal
198 Leaves opposite and 3 together lanceolate acute serrate with the stem downy, Serratures near unequal
199 Leaves opp. and tern. lanc. very much lengthened out serrated to the very end, Bract longer than fl.-stalk
200 Leaves ovate lanceolate simply serrate entire at the end with the stem pubescent, Serratures near unequal
201 Leaves opposite 3 or 4 together cordate lanceolate acuminate doubly serrated with the stem downy
202 Leaves 3 or 4 tog. at base widely cord lanc deeply doubly acutely uneq dent serr Serr sprdg lowest distant.
203 Leaves 3 or 4 tog. ov. acum. cord. at base doubly acutely and uneq serr beneath and with the stem pubesc.

Racemes terminal, Leaves opposite

204 Hoary, Leaves lanceolate serrate acute at the base wedge-shaped and entire, Stem erect
205 Hoary, Leaves lanceolate crenate and nearly entire obtuse, Stem erect
206 Leaves on short stalks stiffish cordate at the base pointed closely acutely and doubly serrate, Stem pubescent
207 Leaves ovate oblong crenate stalked obtuse with the stem pubescent, Spikes many, Bractes very small
208 Stem simp. pub. Lvs. op. lan obl by deg narr fr. base point. ser ent at end, up. ones sub-ser Br lon than fl.-st.
209 Slightly pub. Lvs cren. the rad. ov obl. running down into stalk, Caul lanc sess Fl spkd Br and cal. pilose
210 Tomentose with stlkd. glands, Lvs. tooth rad ov runn down into st. Caul. lan stlkd Fl in spks Br & cal ent.
211 Villous, Leaves serr. rad. ovate, Caul obl acute stalkd. at base and end entire, Fl in racemes, Bractes linear
212 Villous, Leaves cren rad. ov. Caul obl obtuse sub-sess Flow in racemose spikes, Br and cal smooth ciliate
213 Slightly pubesc. Leaves crenulate radical oblong ovate running down into stalk, Cauline lanceol. acuminate sub-sessile, Flowers in close spikes
214 Lvs. uneq. tooth serr with stem pub rad stlkd ov. Caul sub-sess ellipt obl. Fl in spks. Br lin lon than cal.
215 Leaves opp. ov lanc. runn down into st the lower cren the upp. ent. Spks term or 3 tog Fl. like an orchis
216 Leaves ov lan. uneq. ser. Br lan as long as cal Cal 4 part. uneq Seg ov obl. Caps smth rather long than cal.
217 Leaves cordate ovate sessile very obtuse with the very simple stem hairy, Racemes few-fl Calyx smooth
218 Leaves oblong ovate cut and serrated with the stem somewhat villous
219 Stem ascending, Leaves in fasc the lower pinnate, the upper pinnatifid and simp Leafl and div fillf. sprdg
220 Leaves in fasc. stalked pinnatifid lanc Segm nearly entire, Racemes several, Seg of the Calyx lanceolate
221 Leaves in fasc. on short stalks linear pinnatifid Seg entire, Raceme nearly sol Seg of calyx oblong ovate
222 Raceme corymbose term. Leaves radical obl connate sheathing cartil crenate or ent. Stem simp ascending
223 Stem ascend. feeble, Lvs. lanc obt. sub-serr · lower sheathing, Rac loose, Up. seg of cor wider than side ones
224 Leaves obov. cren. with simple ascend. stem pilose, Cauline lvs remote, Rac corymb hairy about 5-flowered

and Miscellaneous Particulars.

rise. All the species thrive in any light loamy soil or loam and peat, and cuttings root freely in sand under a hand-glass.

40. *Veronica.* A word said to have been altered from Betonica (See that name.) *La Veronique*, Fr, and *Ehrenpreise*, Ger. V. officinalis has been much recommended in Sweden and Germany as a substitute for tea, than which Professor Martyn says, it is more astringent and less grateful. Witherng prefers V Chamædrys for the same purpose. Several species were formerly in repute in medicine, and given in disorders of the lungs.

History, Use, Propagation, Culture,

but they are now laid aside by regular practitioners. V. Beccabunga (latinised from *bachbunge*, its German appellation: *bach* is a brook; *beck*, provincial English), is sometimes gathered with watercresses, with which it is often found in limpid streams, and used as a spring salad. Almost all the species thrive in any soil or situation; the tallest are ornamental border flowers; the dwarf spreading sorts are well adapted for rock-work, edgings, or to be grown in pots. A few delight in peat soil, and some in moist situations; all are increased by seed, subdividing at the root, or cuttings. V. decussata will endure the open air if protected from frost.

41. *Galipea.* A name framed by Aublet from the vernacular appellation of the plant in French Guiana, where it is a native.

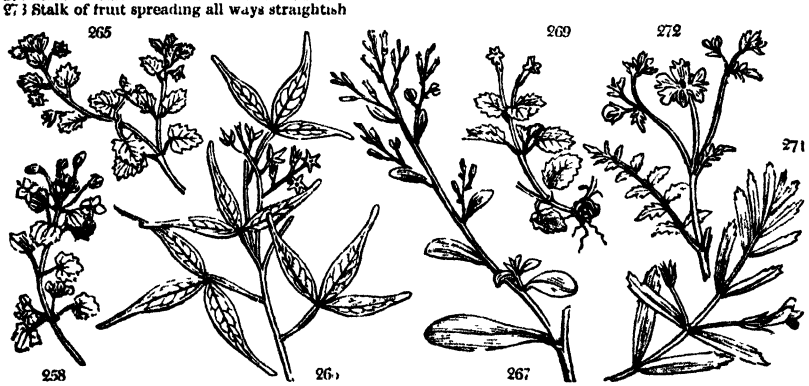
42. *Schwenckia.* John Theodore Schwenck was a professor of medicine at Jena; died in 1671. There was another Schwenck a professor of botany to the garden at Leyden. The genus is, like the merits of the professors, but little known. One inconspicuous species is occasionally seen in our stoves. The

225 Upper leaves obl. sub-serr. Stems erect & shrubby, Rac. many-fl Caps roundish ov scarcely longer than calyx
226 Upper leaves obl. obov sub-serr. Caps. ovate larger than calyx, Stems shrubby diffuse, Corymb term few-fl
227 Leaves smth. ellip ov. ent. or ser Corymb. term. somew spiked, Cal cil. Caps ob Stems tufted herb. simple
β Leaves elliptic ovate obtuse entire
228 Peduncle axillary subracemose few-flow. Leaves obovate obtuse sub-serrated, Fl.-stalks and calyxes pilose
229 Leaves opp oblong crenate with the calyxes smooth, Racemes elongated, Flowers distant, Stem ascending
230 Glandular hairy, Stem ascending, Leaves oblong acute sub-crenate, Raceme elongated
231 Leaves opp ovate irregularly crenate, Stem ascending, Bractes scarcely longer than flower-stalks

Racemes lateral

232 Racemes few-flowered, Leaves elliptical perennial entire, Stem shrubby
233 Radical leaves roundish and oblong, Stem naked very short, Flower-stalk like a scape about 3-flowered
234 Leaves elliptical obtuse on short stalks serrulate, Cal. 4-parted, Stem procumbent below rooting
235 Leaves lanceolate serrate stem clasping, Cal 4-parted, Stem erect
236 Leaves linear lanceol nearly entire, Flow.-stalks pendulous or spreading, Cal. 4-parted, Stem nearly erect
237 Leaves lin. lanc lower pectinate pinnatifid, upper entire, Cal leaves unequal subulate, Stems procumbent
238 Leaves sess. pinnatifid and bipinnatifd, Lower bracte 3-fid longer than fl -st Cal 5-part Stem nearly erect
239 Leaves sess lanceol incise serrate and pinnatifid, Bracte entire shorter than fl -st Cal 4-part Stem feeble
240 Leaves bipinnatifid, Segm lanceol and lin Cal leaves unequal subulate, Stems procumb woody at base
241 Leaves oblong roundish stiff shining, with the procumbent creeping stem smooth, Flowers in close spikes
242 Leaves obovate or roundish serrate, Cal 4-parted, Stem rooting at the bottom
243 Leaves sessile oblong obtuse serrated the upper lanceol flat, Cal 4 or 5-part. Flowering stem ascending
244 Stem erect hairy all over, Lvs. sub-sess oval coarsely and acutely cren hairy, Cal. 4-part. larger than corolla
245 Leaves somewhat heart-shaped ovate sessile unequally obtusely serrate, Stem erect, Cal. 5-leaved
246 Lower leaves oblong coarsely serrated with the stem villous
247 Leaves sub-sessile ovate lanceolate unequally serrated, Cal. 5-parted, Segm and bractea linear subulate
248 Lvs cut serr the upp cord ovate sess the low. ov. stalk. Cal 4-part Stem hairy in 2 rows, Rac. long than stem
249 Leaves sessile cordate ovate acute serrate, Cal 4-parted, Stem erect
250 Leaves cord. ovate obtuse coarsely serrated with the stem and stalks hairy, Cal. 4-part. Rac elong filiform
251 Racemes lateral stalked many-flow Leaves entire very smooth ovate acuminate joined together at the base
252 Racemes very long, Leaves elongate lanceolate acuminate unequally serrate
253 Fl.-stalks rather longer than bract Lvs lanc. wedge-shaped at base simply and doubly toothed, Stem prostrate

Flower-stalks one-flowered



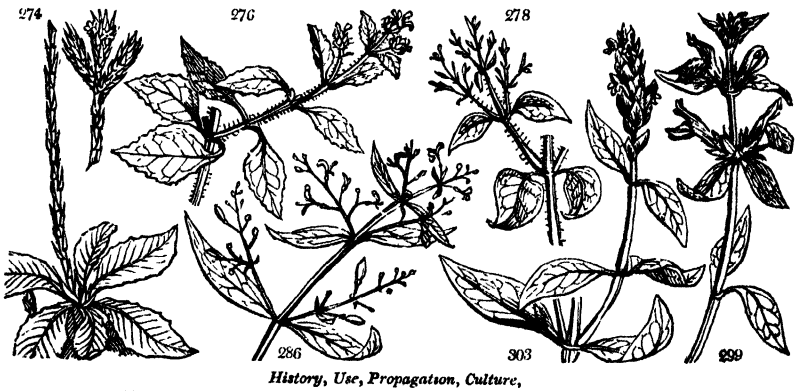
254 Flowers sub-sess. Leaves finger-parted, the upper undivided, Fl.-stalks shorter than the calyx, Stem erect
255 Flowers sessile, Leaves all finger-parted
256 Lower leaves entire middle finger-parted upper trifid, Fl.-stalks longer than calvx, Stem erect spreading
257 Leaves as long as stalk cord rounded 5-lobed the upper 3-lobed, Segm. of cal. cord acute, Stem procumbent
258 Leaves cord. rounded with 5 or 9 but generally 7 teeth obtuse a little fleshy, Cal. of fruit spread. Caps hairy
259 Flowers sessile, Leaves oblong a little serrate longer than calyx, Stem erect
260 Leaves roundish cordate crenate, Flower-stalks very long, Calyx leaves lanceolate
261 Flower-stalks as long as the leaves, Calyx 2-leaved, Leaflets 2-lobed serrate
262 Low. lvs stalk. cord ov serr floral nearly sess short than fl -st Caps obov emarg turgid, Stem rather upr.
263 Flow stalked, Low lvs stalked ov serr floral s -sess as long as fl -st. Caps obcord. comp Stem nearly simple
264 Flow nearly sess Low lvs stalked cord. ov serr caul. cren floral lanc sess longer than stalk, Cal unequal
265 Leaves stalked cord ovate serr Cal leaves ovate, Stem procumb. Fl.-stalks scarcely shorter than the leaves

266 Leaves alternate stalked, lanceolate entire

267 Stem slender simple, Leaves lanceolate, Cor thrice as long as calyx

268 Leaves lanceolate serrate somewhat 3-nerved, Flowers on stalks
269 Leaves oblong acutely serrated, Stem creeping, Flowers racemose [acuminate longer than the calyx
270 Leaves obovate lanc narrowed below remotely toothed nerved smooth, Fl.-stalk alternate very short, Caps
271 Leaves lin lanc. with a few teeth, Fl.-stalks as long as the leaves, Caps much shorter than the subulate calyx

272 Stalk of fruit on one side deflexed at base
273 Stalk of fruit spreading all ways straightish



and Miscellaneous Particulars.

appendages to the corolla are very singular, and demand a better explanation of their nature than has yet been offered.

43. *Gratiola.* From *grātia*, grace (of God) Matthiolus called it gratia Dei, in allusion to its effects G officinalis is so bitter and obnoxious to cattle, that Haller assures us, there are meadows about Yverdun rendered entirely useless by its abundance. It is a powerful cathartic, and was long in use as such, but now laid aside.

44. *Sebastiana* So named by the authors of the Flora Peruviana, from σεβίζω, to cut, and ἄνθος, a flower One of the most beautiful of herbaceous genera. Two species or rather varieties are now known, and ornament the green-house with their elegant panicles of lilac and white flowers. They are difficult of cultivation, requiring a very pure and moist atmosphere. They may be propagated by cuttings, but the best plants are raised from seeds, which have not hitherto been obtained, except from flowers artificially impregnated.

History, Use, Propagation, Culture,

45. *Elytraria* From ἐλυτρον, an envelope, its stem being covered with sheaths or scaly envelopes. Little herbaceous plants of no ornament.

46. *Hypoestes*, ὑποστης, is an interior garment: it is probable that the involucrum suggested the application of the name. The plants have the habit of Justicia, from which they have been separated, and are chiefly tropical weeds.

47. *Justicia* In honor of James Justice, F.R S, an eminent Scotch cultivator, author of the *Scotch Gardener's Director*, published in 1784 J pectoralis has the smell of new hay, combined with a refreshing aroma. In Domingo and Martinico the inhabitants make a syrup of it, which they use against disorders of the breast. The bruised leaves are good in wounds, whence the English appellation balsam, and the French name *herbe à charpentière* J nasuta is said to possess extraordinary aphrodisiacal powers, and milk boiled in the roots is much employed on that account by Indian physicians. Rubbed with lime-juice, the roots are used to cure ring-worms. Most of the species are free flowerers, some as J. lucida

274 Flowering scales ovate villous at edge, Leaves lanceolate smooth entire, Scapes very long, Caps. obtuse
275 Stemless, Flowering scales ovate entire, of the scape lanceolate naked at the edge, Leaves oblong crenate

276 Racemes axillary erect shorter than the leaves which are lanceolate toothed and with the stem hairy
277 Spikes axillary and terminal, Bracteas lanceolate smooth, Branches pubescent

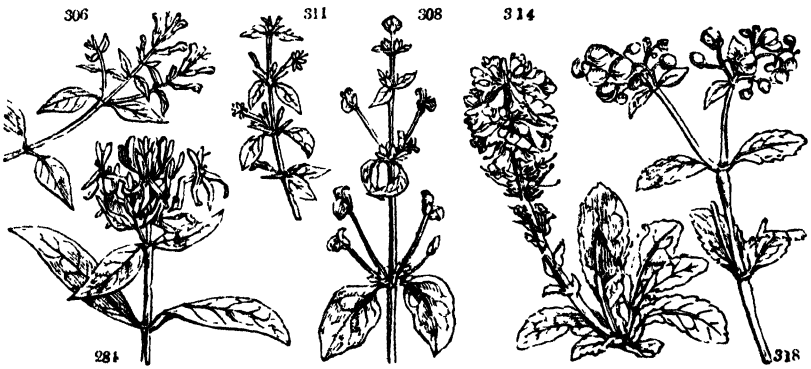
Calyx double.

278 Panicles axillary dichotomous

Calyx simple, Flowers labiate

279 Spikes terminal 4-sided imbricated, Bracteas oval, Leaves oblong ovate acuminate, Helmet linear
280 Spikes terminal, Bracteas and leaves elliptical, Helmet lanceol reflexed at the end, Stigma of two plates
281 Leaves linear lanceolate, Flowers nearly solitary sessile tubular 4-cleft
282 Spikes terminal 2-ranked, Bractes setaceous, Leaves linear lanceolate
283 Racemes term somewhat branched, Cal. whorled smooth, Leaves lanc elliptic, sharp at both ends stalked
284 Racemes term comp Pedunc 3 or 4-flowered, Bract. lanc. Leaves oblong pointed, Branches square rough
285 Racemes axillary and terminal, Flowers inflated at the throat whorled, Leaves elliptical variegated
286 Stems 4-sided brachiate, Leaves sub-sess lanc Flowers 1-sided erect, Lip linear revolute, Flowers downy
287 Racemes terminal compound 1-sided many-flowered, Bract. setaceous, Leaves ovate oblong. acuminate
288 Flowers axillary solitary sessile opposite, Calyx hispid, Leaves lanceolate obtuse ciliated at the base
289 Spikes terminal in heads, Leaves elliptic nerved blistered shining, Upper lip of corolla lanceolate
290 Spikes terminal leafy, Flowers whorled, Leaves elongated
291 Spikes axillary and terminal, Bractes oblong imbricate ciliate obtuse
292 Spikes axillary, Flowers close, Flower-stalks elongated alternate, Leaves lanceolate
293 Spikes lateral and terminal, Calyx 4-leaved linear hairy, Lower lip ovate, Leaves oblong
294 Spikes axillary and terminal filiform, Spikelets whorled
295 Spikes axillary and terminal, Flowers in pairs below single above, Bractes wedge-shaped
296 Upper lip of corolla subulate, Flower-stalks axillary dichotomous, Leaves elliptical entire
297 Panicle terminal dichotomous, Flowers spiked distant
298 Upper lip emarg. reflexed, Flowers axillary solitary sub-sess. opposite · term. in spikes, Lvs. ovate lanceolate
299 Lower lip 3-lob Flow axillary solitary and spiked, Lvs ovate oblong narr at each end, with stem pubescent
300 Lower lip 3-lobed, Flowers axillary sessile whorled, Bractes linear lanceolate, Leaves lanceolate.

Calyx simple, Flowers ringent.



301 Spikes axillary and term. Flowers opposite, Bract. shorter than cal. Stem. and branc round 6-streak Leaves
302 Spikes axillary opposite, Bractes ovate acute nerved [ovate accuminate wavy-stalked
303 Spikes terminal, Bract ovate acuminate netted with veins, Leaves lanceolate ovate stalked
304 Leaves lanceolate entire obtuse, Peduncles axillary 3-flowered 2-edged, Bractes shorter than the calyx
305 Peduncles solitary axillary one-flowered, Leaves lanceolate acute at each end sessile

306 Umbels axillary 3-flowered, Bractes 2 wedge-shaped, Leaves ovate, Flowers in loose spikes
307 Spikes axillary and terminal recurved, Leaves lanc ovate hairy sessile, Bractes 2, Flowers in loose spikes
308 Flowers axillary rather whorled, Bractes 2-valved subcordate, Leaves ovate
309 Spikes axillary and term 1-sided villous, Dorsal bractes lanc 2-ranked with a membran. margin at the base
310 Spikes terminal, Bractes obovate retuse imbricated smooth, Leaves ovate acuminate

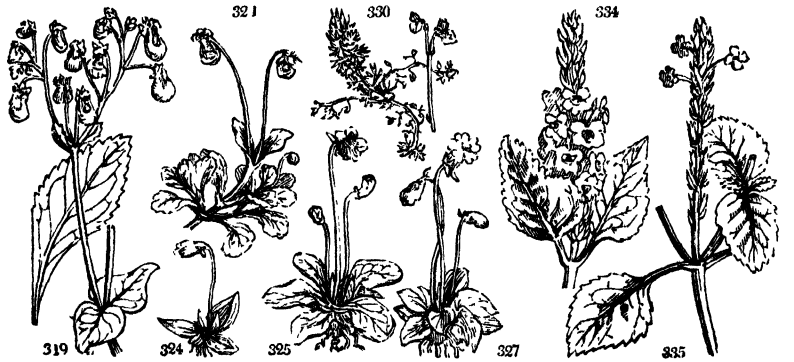
311 Flower-stalks about 1-flowered, Leaves oblong, Spines axillary
312 Spikes axillary and terminal imbricate, Bractes oblong veiny, Leaves ovate acuminate
313 Leaves ovate acuminate repand, Corolla with a long tube white with a purple stain

314 Stemless, Leaves radical very smooth coarsely crenate, Flowers on one side

315 Leaves all pinnate pinnæ toothed, of the lower leaves pinnatifid
316 Lower leaves pinnate superior pinnatifid 3-lobed and simple
317 Leaves lanceolate very rugose with spreading teeth, Flowers terminal dichotomous
318 Leaves lanceolate toothed rugose, Flowers terminal dichotomous

and Miscellaneous Particulars.

are shewy, others are the commonest weeds of the tropics, all are readily propagated by cuttings in heat under a glass.



48 *Diclıptera ;* δις, double, and κλυω, to shut. The fruit being compounded of two valves. This genus has been formed like Hypoestes out of the Linnæan Justicia, with which it agrees in habit.

49. *Eranthemum* A name applied by the ancients to their Anthemis, from ηρ, spring, and ανθος, a flower. The word has been applied to the present genus with no apparent reason. The species are very pretty ornaments of the stove

50. *Wulfenia* Named after F X Wulfen, a German botanist, and author of a work on the plants of Carinthia. A small and very beautiful herbaceous plant.

51. *Calceolaria* From calceolus, a slipper, in allusion to the shape of the corolla. C. pinnata may be raised from seed in a hot-bed in spring, and transplanted to the borders with other tender annuals. The regions of Chili and Peru abound in many splendid species, some of which have lately been introduced to this country.

History, Use, Propagation, Culture,

C. corymbosa and paralia, are exceedingly beautiful herbaceous plants of difficult increase The shrubby and branching herbaceous kinds are easily propagated by cuttings

52. *Pinguicula* From pinguis, fat, on account of the greasiness of its leaves In P. vulgaris, the structure of the stigma, and its close application to the stamens is very remarkable. Linnæus says, that the warm milk of the rein-deer poured on the fresh leaves, and set aside for a day or two, becomes acescent, acquires consistence and tenacity, and neither the whey nor the cream separate. In this state it is considered a very grateful food in Sweden and Norway. On cows' milk it acts like common rennet. The plant eaten by sheep has been supposed to produce the liver-rot; but a flat apterous insect, the fasciola hepatica or fluke, found adhering to stones and plants in boggy grounds, as well as in the liver and biliary ducts of sheep affected by the rot, is a more likely cause, and the more especially as no animal whatever will feed on the plant. The species (except P. grandiflora) are cultivated with difficulty in artificial shaded morass P grandiflora will thrive well on a dry northern bed of bog-mould among North American shrubs

53. *Utricularia.* From utricula, a little bottle, from the small inflated appendages to the root. The species are scarcely susceptible of cultivation · they are very numerous in hot countries, and there form the most elegant ornaments of rivulets and pools of water The flowers are fugacious, and so delicate as not to be capable of preservation as dried specimens, in which state their naturally beautiful colors of purple, pink, violet, or yellow, all change to a dead and uniform black.

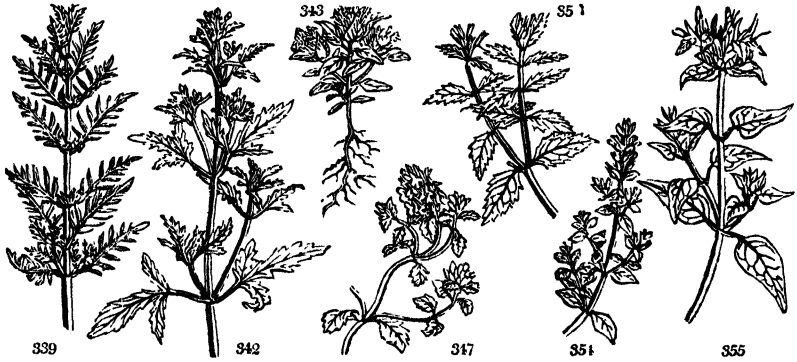
319 Leaves radical ovate and cordate stalked twice-crenate, Cauline cordate half embracing the stem
320 Leaves unequally toothed · the radical cuneate; upper oblong connate with the Capsules tomentose
321 Leaves spatulate entire hairy above, Flower-stalks like a scape 1-flowered

322 Nectarium conical thick at the end, obtuse shorter than the flowers, Scape villous, Capsules globose
323 Nectarium subulate nearly straight as long as the petals, Upper lip 2-lobed: lower 3-parted, Scape smooth
324 Nectarium conical recurved shorter than the petals [dilated
325 Nectarium subulate straight as long as the flower, Upper lip spreading emarg very large lower 3-lobed throat
326 Nectarium subulate recurved shorter than the campan flower, Throat bearded, Lips toothed, Scape villous
327 Nectarium subulate recurved shorter than the campan cor. 5-lobed: lobes emarg entire, Palate prominent, [Scape pubescent
328 Nectarium conical, Upper lip entire equal to the palate, Leaves very finely divided
329 Nectarium carinate, Upper lip emarg equal to the palate, Lvs dichotomously 3-part. Cor with throat open
330 Nectarium conical, Upper lip entire twice as long as the palate, Leaves dichotomously 3-parted

331 Leaves lanceol. obl. narrower at the base remotely toothed with stem very smooth, Bract. lin. lanceolate
332 Leaves oblong ovate tooth-serrated smooth, Branches hairy, Bractes ovate shorter than calyx
333 Leaves ovate serrate rough rugose, Stem shrubby, Bractes ovate larger than the calyx
334 Leaves serrate ovate rugose with the stem hoary, Bractes lanceolate shorter than the calyx
335 Leaves ovate obtuse serrate, Spikes lax, Bractes subulate shorter than the calyx
336 Leaves ovate crenate serrate smooth very obtuse
337 Leaves ovate acutely crenate with the stem very hairy, Spike very long, Bract appressd smaller than the cal.

338 Leaves ovate lanceolate villous sinuate serrate
339 Leaves pinnatifid hairy, Lobes oblong somewhat toothed
340 Leaves lanceolate the lower pinnatifid at the base. the upper remotely serrated, Stem smooth
341 Leaves pubescent ovate pinnatifid, Segments lanceolate. lowest the shortest, deeply cut at the end

342 Leaves opposite stalked 3-parted coarsely serrated smooth



343 Bractes ovate acumin ciliate, Leaves elliptic lanceolate
344 Flowers in spiked racemes, Bractes obovate nerved acute, Leaves ovate
345 Flowers lateral, Leaves lanceolate
346 Leaves lanceolate naked nerved of one shape entire hoary, Flowers in spikes
347 Heads term oval, Leaves ovate sub-serrate those of the flowers nearly of the same shape entire ciliated
348 Leaves ovate acuminate nearly entire nerved, Flowers in heads, Calyx hairy pubescent at base
349 Whorls terminal and axillary close hispid, Leaves ovate sub-ciliate, Stems procumbent hairy

350 Flowers lateral, Leaves lanceolate entire ciliated, Cor with an inflated throat twice as long as calyx

351 Leaves ovate serrate sessile, Flowers axillary and terminal, Stems erect
352 Leaves ovate acuminate, Flowers in heads, Stem decumbent

353 Pubescent, Leaves oblong serrated, Flowers axillary whorled, Lower lip of calyx with 2 ciliated bristles
354 Leaves oval entire, Flowers whorled, Stem square

355 Leaves obl lanc cord pubesc remotely and closely ser Flowers in heads, Involucr purple stem swollen
356 Leaves ovate oblong cordate pubesc coarsely serrated, Flowers in heads, Involucr purple, Stem fistular
357 Leaves obl cord pub remotely serrate upper entire, Flow in heads, Invol pale, Upper lip of cor. bearded

and Miscellaneous Particulars

54 *Stachytarpheta*, σταχυς, a spike, and ταρφυος, dense The name would be better changed, as it has been by Link, to Stachytarpha This genus is partly composed of Verbena, *L* S. mutabilis is a beautiful species, and nearly always in flower All of them strike readily in heat under glass

55 *Lycopus* From λυκος, a wolf, and πους, a foot, on account of a fancied resemblance between the cut leaves and a wolf's foot. *Le Marrube aquatique*, Fr. *Der Wolfsfuss*, Ger, and *Lacopo*, Ital L. europæus is common in most parts of Europe in meadows, but is not eaten by cattle It dyes black, and gives a permanent color to linen, wool, and silk. Withering says, gypsies stain their skin with it. According to Adamson, it has two barren filaments, and Pollich remarks, that there are sometimes 82 flowers in a whorl

56. *Amethystea* From αμεθυστος, the amethyst, alluding to the color of the flower A pretty annual, not very common in gardens

57. *Ziziphora* Etymology uncertain This genus, and the two following, consist of little herbaceous plants resembling thyme they are generally pretty, and easily cultivated It would, perhaps, have been better to unite, with some writers, Ziziphora, Cunila, and Hedeoma, in one genus

58 *Cunila*. A Roman name applied by Linnæus to this genus The plants of Pliny bore some resemblance to those which compose the Linnæan Cunila (See No 57) The leaves of C. mariana are used in decoction for colds.

59. *Hedeoma*, ἡδυοσμα, a Greek name for mint. (See No 57.)

60. *Monarda* In honor of Nicolas Monardes, a physician of Seville in the 16th century Most of the species

History, Use, Propagation, Culture,

are aromatic, and resemble mint in their habits and mode of culture The leaves of M didyma are sometimes used as tea in North America, its flowers are of a very brilliant scarlet

61 Rosmarinus Two Latin words signifying dew of the sea The shrub grows in the southern parts of Europe in the vicinity of the sea R. officinalis yields, by distillation, a light-pale essential oil of great fragrance, which is imparted to rectified spirit It was formerly recommended for strengthening the nervous system, headaches, &c as well as to strengthen the memory Hence the allusion of the poet, "there's rosemary, that's for remembrance" Rue in former times signified grace, and rosemary, repentance Rosemary was considered as an emblem of fidelity in lovers, it was worn at weddings and funerals, and on the latter occasions is still in some parts of Wales distributed among the company, who throw the sprigs in the grave along with the corpse It is the principal ingredient in Hungary water, and is drunk as tea for headaches, and by nervous persons It prefers a lean dry soil, or rubbish of old buildings, and when it has established itself on a wall, will resist the greatest cold of our winters. Its introduction is beyond record, and was probably by the monks in the dark ages.

62 Salvia. From salvere, to save, on account of its supposed healing qualities This large and very natural

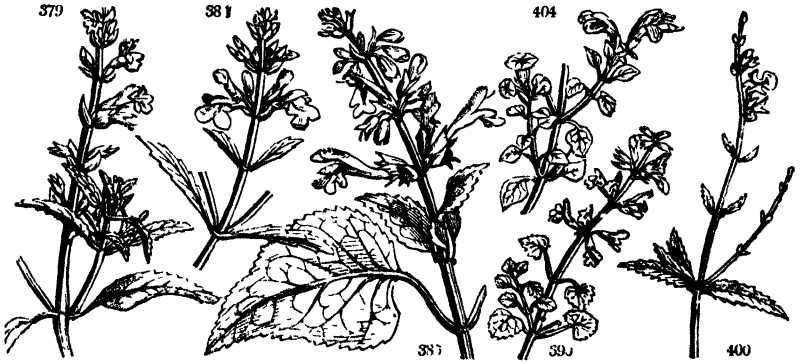
359 Leaves oblong lanceolate rounded and narrowed at the base villous flat, Cor. dotted
359 Leaves ovate lanc rounded and unequal at the base pubesc. remotely serr. Flowers in heads, Bractes pale
360 Smooth, Heads large leafy, Calyx colour bearded, Cor long smooth, Lvs. ov obl coarsely serr. Stem smooth
361 Leaves ovate acuminate rounded at base and equal hairy coarsely serrated, Flowers in heads, Bractes pale
362 Leaves ovate lanceolate cordate smooth rugose [bright crimson
363 Leaves obl. pointed stalked ovate, Flowers in heads, Bract small acute, Stem square pilose, Flowers very long
364 Leaves ovate acum sub-cordate closely serrated smoothish, Flowers in headed whorls, Involucres purple
365 Leaves ovate attenuated, Stems and whorls hairy, Bractes ovate as long as the calyx
366 Very hairy all over, Flowers small in whorls, Leaves ovate acuminate serrate on long stalks, Stem square
367 Leaves lanceolate remotely serrated smooth, Flowers in whorls, Bractes pale

368 Leaves sessile

369 Leaves on stalks

Calyx 3-lobed, enlarged

370 Leaves ovate lanceolate rugose crenulate undulate, Calyx blunt longer than ovate bracte
371 Leaves ovate crenate flat hoary netted with veins, Calyx 3-lobed dilated retuse with little lips
372 Leaves triangular hastate oblong crenated obtuse
373 Hoary, Lower leaves roundish truncate at base smooth · upper oblong entire, Calyx of fruit large
374 Leaves linear oblong serrate, Whorls 2-flowered, Calyx obtuse
375 Leaves interruptedly pinnate, Stem shrubby erect
376 Leaves pinnate in 2 or 3 pairs, Leaflets sess lanceol. obtuse crenulate rugose, hoary beneath, Bract cordate
377 Hairy viscid, Leaves interruptedly pinnate, Leaflets oblong eroded unequal-sided, Calyx inflated
378 Leaves pinnate entire, Leaflets lanceolate nearly equal upper generally in pairs



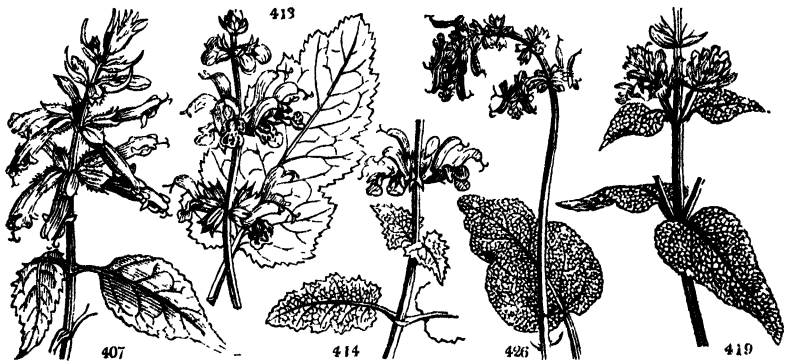
Calyx 3-toothed, sub-cylindrical

379 Leaves lanc obt. remotely serrate stalked beneath pub Spike racemose winged, whorls 2-fl. Bract lanceolate
380 All hairy, Leaves oblong ovate crenate, Flowers in spiked whorls, Bractes roundish acute
381 Leaves lanceolate the lower serrated outwards, with the stem hoary, Lower lip very broad, Calyx acute
382 Leaves linear lanceolate the lower serrated outwards with the stem smooth, Segments of calyx rounded
383 Leaves ovate acute serrated villous on each side, Stem hairy
384 Leaves obl. ov. rugose serr smooth dotted, Flowers in spiked whorls on one side, Bract decid Helmet hairy

385 Lvs somew rhom ov acum serr at base and apex quite ent beneath dev above hoary, Bract decid. hoary
386 Leaves ovate crenate rugulose hoary, Calyx with stellate hairs, Stem decumbent
387 Leaves ov acum serr beneath hoary, Spikes term Lower whorls remote, Bract decid shorter than calyx
388 Leaves ovate serrate, Leaf stalks with a point on each side, Spikes imbricate, Bract ovate ciliated narrowed
389 Leaves sub-cordate obtuse unequally bluntly serrated, Calyx viscid villous as long as corolla
390 Leaves cordate obtuse rugose crenated hoary beneath, Calyx villous viscid as long as corolla
391 Leaves cordate rugose crenate equally serrate acute, Calyx smoothish
392 Leaves ov serr glaucous beneath, Racemes comp Flowers on one side, Leaf stalks with 2 glands at base
393 Leaves cordate crenate blistered wavy at edge obtuse smooth, Bractes ovate shorter than calyx
394 Leaves cordate crenate, Flowers axillary whorled, Stem shrubby
395 Leaves cordate acute tomentose serrate, Corolla twice as long and narrower than the calyx
396 Leaves cord. acute smoothish cren. the upper sess whorls 6-10 fl Helmet hairy entire the length of stamens
397 Leaves cordate crenate stalks with 2 calli, Stem and calyx clammy with hair, Bractes ovate ciliated
398 Villous viscid, Leaves cordate arrow-headed coarsely serrated acuminated, Helmet entire
399 Leaves cord ovate acuminate lucid serrat downy beneath, Spikes numerous axillary and term very dense

Calyx 5-toothed, generally 3-2

400 Leaves linear lanceolate toothed rugose, Bract. ovate mucronate
401 Leaves linear lanceolate, Flowers nearly digynous, Cal. 2-leaved
402 Leaves obovate wedge-shaped toothletted
403 Lower leaves spatulate serrate truncated at base toothed upper oblong nearly entire, Cal hairy
404 Leaves obl nearly entire hoary, Cal hairy of the fruit enlarged veiny with a membranous coloured limb
405 Leaves lanceolate ovate crenulate, Whorls few-flowered, Cal mucronate longer than bractes



and Miscellaneous Particulars

genus consists of herbs or under-shrubs, the leaves of which have generally a rugose appearance, the smell aromatic, and the flowers commonly in spikes, two or three together from a bracte or leaf. They are all of easy culture, and some of them are ornamental as greenhouse plants or border flowers. The Horminum, Salvia, and Sclarea of Tournefort are included in this genus. The Sclarea or clary is derived from σκληρος, stiff, and Horminum from ὁρμαω, quod ad venerem stimulat. Of S. officinalis there are many varieties, differing in the size, form, and color of the leaves. It was formerly in great repute in medicine as a sudorific, aromatic, astringent, and antiseptic. The Chinese use it as a tonic for debility of the stomach, and strengthening the nervous system, and prefer it for these purposes to their own tea. It is, however, discarded from our pharmacopeiæ, but still used by self-practitioners and herb doctors. In cookery it is used for sauces and stuffings for luscious meats. S. grandiflora is preferred for making tea. S. pomifera produces protuberances as big as oak galls, occasioned like them, by the puncture of an insect. In the isle of Crete, S. officinalis has the same sort of excrescences, and they carry them to market there under the name of sage-apples. S. verbenaca is a native of all the four continents, and very aromatic. A mucilage is produced from its seeds, which, put under the eyelids for a few moments, envelopes any sand or dust there, and brings it out, and hence the name of officinalis christi, clear

History, Use, Propagation, Culture,

respondent of Linnæus: he died in 1768 *Horse-weed*, Amer The species are American plants of easy cultivation

64 *Catalpa* The Indian name *Die Trompetenblume*, Ger C syringifolia, *H K* is the Bignonia catalpa, *L*, a low-spreading, rather singular looking tree, with succulent shoots easily injured by winds or severe frosts. It requires a sheltered situation and plenty of room The leaves are large and come out late, the flowers are white, shewy, and are succeeded by long pods, but they seldom appear in this climate. One of the oldest catalpas in England is in Gray's Inn gardens, said to have been planted there by Lord Bacon C longissima is an elegant upright tree, known in the West Indies by the name of French oak, and the French call it *chêne-noir*

65 *Ghinia* In honor of an Italian botanist, named Ghini, who founded several botanic gardens

66 *Fontanesia.* So named by Billardiére, in honor of M Desfontaines, the excellent professor of botany at the Jardin du roi at Paris It is rather a tender shrub, requiring shelter in severe weather It grows in common garden soil, and is increased by layers or by cuttings in sand under a hand-glass

67 *Lenociera* Named after Geoffroi Linocier, a French physician A tropical genus of shrubby plants, propagated by cuttings, and of little beauty in a cultivated state

68 *Ancistrum* From ἀνκιστρον, a hook Its calyx is terminated by little hooks These are small herbaceous plants with pretty foliage, but no beauty in their flowers They are only cultivated as objects of curiosity, and are seldom seen.

69 *Ornus* In Greek, ορεινος, from ορος, a mountain The tree grows on mountains. *La Frene à fleurs*, Fr. *Die Blühende Esche*, Ger, and *Frassino florido*, Ital O europæa, *P S* is the Fraxinus ornus, *L* O. rotundifolia, or the manna ash, abounds in the skirts of the mountains in Calabria From the middle of June to the end of July the manna gatherers make an incision across the bole of the tree, which they deepen the second day, inserting a maple leaf, so as to form a sort of cup to receive the gum as it distils from the incision. Sometimes bits of reed or twigs are applied, on which the manna oozes out, and drying with the sun, forms tubular

467 Leaves oblong acute at both ends, Stem smooth, Cal teeth very short, Flowers terminal naked
468 Leaves sub-rhomboidal ovate, Cal teeth bristly longer than the tube, Panicle leafy, Stem much branched
469 Leaves ovate cordate rugose, Flowers tetrandrous

470 Leaves cordate flat
471 Leaves oblong undulated

472 Fruit with 4 spines, Leaves smooth

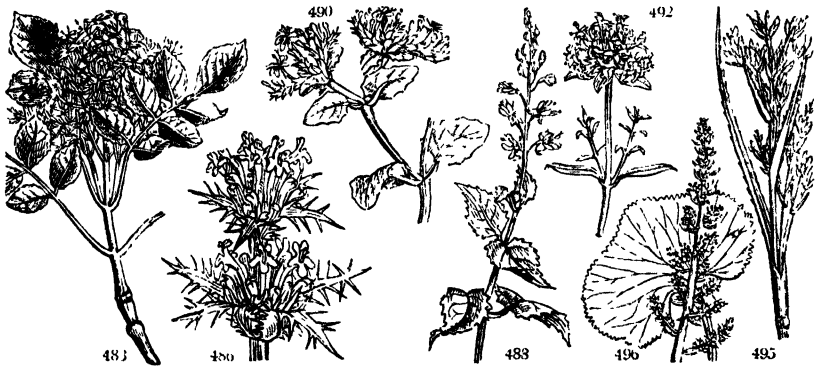
473 Leaves ovate-oblong pointed at each end, Flowers racemose

474 Racemes compound and decompound, Flowers sessile in threes, Petals subulate

475 Leaflets oblong cut, Flower-stalks like scapes, Spikes elongated prickly, Stems half under ground
476 Leaves linear-lanceol. sub-pinnatifid hairy beneath, Spikes cylindrical, Stem erect
477 Leaves oblong and a little wedge-shaped serrated silky beneath, Spikes globose, Stems creeping
478 Leaflets oblong and obovate serrated smoothish, Spikes round, Stem decumbent
479 Leaves remote, Leaflets wedge-shaped serrated silky beneath, Spikes globose, Stem decumbent
480 Leaves 3-5-parted, Segments linear-villous beneath, Spikes oblong, Stem half under ground
481 Leaflets ovate-oblong serrated silky beneath, Spikes globose, Stem creeping
482 Leaflets oval crenate and cut smooth above hoary beneath, Spike terminal cylindrical, Stem decumbent

483 Leaves lanceolate attenuated stalked serrated
484 Leaves roundish acute doubly serrated nearly sessile
485 Leaflets oblong tapering acuminate acutely and unequally serrated, Male flowers with a corolla

486 A plant like the Acanthus Flowers in whorls



487 Stem pubescent erect, Leaves ovate acute denticulate sub-pubescent
488 Stem erect simple nearly smooth, Leaves cordate with spreading teeth acuminate
489 Stem much branched erect smooth, Leaves cordate smooth shining

490 Upper leaves toothed and angular, Flowers in heads

491 Involl 4-lvd leafl broad ov. smth on both sides much short than the head, Lvs lin.-stalk 1-nerv Cor silky
492 Involl 4-lvd leafl lanceol ovate acute smooth on both sides, Leaves lanceol lin Cor hairy on its lower half
493 Leaves oval-obl. flat pubesc beneath, Floral lvs. longer than the head, Cor cylind. deciduous, Fruit berried
494 Lvs. smooth on both sides lin lanc. twice as narr. as the floral lvs longer than the few-fl head, Cor smooth

495 Culm round, Corymbs dense, Panicle contracted, Flowers in bunches

496 Leaves uniform toothed shorter than the scape in seed, Scape and leafstalks smooth

and Miscellaneous Particulars

pieces called manna in Cannali, which being reckoned more pure, sells higher by one-third than the manna in Tarzeti Manna is a concrete mucilaginous juice, mild, and slightly nauseous. It seems to have no relation to that which nourished the Hebrews in the desert, being, as Rozier observes (Dict. d'Agr.), much more likely to have purged than nourished them The Fraxinus virgata, *P S* also affords manna, but from no other species of ornus can it be procured The Ornus floribunda has lately been discovered in Nepal, where it is called kanga and tahasee

70 *Morina* In memory of Lewis Morin, a French botanist, and son of Peter Morin, a florist celebrated in the 17th century. This plant is of very rare occurrence. It is not unlike the common acanthus, but more beautiful. Propagated by seeds

71 *Circæa* Poetically named after the enchantress Circe The genus grows in damp shady places where shrubs fit for incantations may be supposed to be found. The Greeks had a plant named circæa. All the species are easily cultivated, and are curious on account of their singular flowers C lutetiana has been found in Nepal.

72 *Fedia* A name of Adanson's, which, like many others of the same author, has probably no meaning The genus has been very properly distinguished from Valeriana by Decandolle, as well as from Valerianella, with which it has recently been again confounded. A weed-like annual is the only species yet in our gardens

73 *Pimelea* From πιμελη, fat, but if so, it should be written Pimeleæa. A real and extensive genus of plants, natives of the southern hemisphere. Many of the species are from N. Holland, and are chiefly known by the brief descriptions of Mr R. Brown

74 *Cladium* From κλαδος, a branch or twig A tall sedge-like plant, referred by Linnæus and his school to Schœnus. C. germanicum is the only European species, it is the Schœnus mariscus of English botany The others are chiefly from N Holland.

75. *Gunnera.* After Ernest Gunner, bishop of Norway, of which country he published a Flora A singular plant, cultivated merely as an object of curiosity. It likes a moist peat soil, and the temperature of a cool greenhouse.

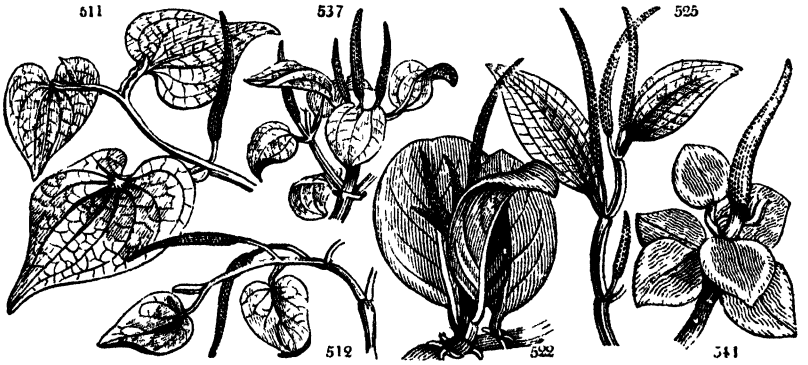
History, Use, Propagation, Culture,

76 *Anthoxanthum* From ἄνθος, a flower, and ξανθὸς, yellow, the spikes being yellow This grass has the valves of the calyx sprinkled over with minute yellow dots, similar to those of black-currant berries, hence, possibly, its peculiar scent. It is this grass which gives the peculiar smell to meadow-hay, that made from ray-grass or other sown-grasses having no such odour It is one of the earliest flowering grasses, grows on any soil, but prefers one moderately dry Stillingfleet recommends its being sown with a view to improve the flavor of mutton. But its seeds are collected with so much difficulty that they are too costly to be sown in any great quantity

77 *Piper* Undoubtedly from pippul, the Bengalese name of the long-pepper, notwithstanding the learned derivations of authors from πίπτω, πίπτει, to digest. The plants of this genus are mostly succulent, perennial, herbaceous, or frutescent, often scandent as in that species which furnishes the pepper of commerce, dichotomous and jointed P nigrum furnishes the pepper of commerce It grows wild in the East Indies, and in Cochin China, and is cultivated in Malacca, Java, and especially in Sumatra The pepper or seed is distinguished in the shops as black or white, the former is the dried berry in its natural state, the latter, the berry deprived of its skin, by steeping about a fortnight in water, and then drying in the sun Black pepper is the hottest and strongest. As a spice, pepper differs from most others by its pungency residing not in the volatile parts or essential oil, but in a fixed substance, which does not rise in the heat of boiling water The culture of the plant in the pepper farms of the East very much resembles that of the hop in England Holes are made in prepared ground at from six to twelve feet apart every way, in these from two to six cuttings of the pepper vines are

DIGYNIA.

497 Spike ovate oblong, Flowers on short stalks longer than the beard spreading, Outer glumes ciliated
498 Panicle spike-shaped sub-lanceolate, Leaves smooth glaucous green, Nect. adnate to the seed, Cor. loose
499 Spike ovate dense, Sheaths smooth, Leaves ciliated



TRIGYNIA.

Shrubby.

500 Leaves broad-lanceolate pointed coriaceous, Berries stalked
501 Lvs elliptic lanc attenuated very smooth dotted shining above at the base unequal, Spikes recurved at tips
502 Leaves ovate oblong or elliptic acuminate unequal at the base rough on each side, Spikes axillary uncinate
503 Leaves ovate oblong many-nerved acuminate smooth unequal at base, Leaf stalks margined, Joints equal
504 Leaves elliptic oblong acuminate many-nerved unequal at the base, Joints knotty
505 Branches round hairy, Leaves ovate oblong above rough veins beneath and stalks hispid
506 Leaves ovate oblong 5-nerved rugose on each side smooth equal at the base
507 Leaves ovate attenuated 7-nerved, Stalks 2-toothed
508 Leaves broad ovate acuminate 7-nerved coriaceous smooth, Joints knotted
509 Leaves broad cordate 5-nerved at the base unequal, beneath discoloured, Spikes lax with remote flowers
510 Leaves cordate acuminate 5-9-nerved very smooth equal to the leaf stalks
511 Leaves cordate acuminate 9-11-nerved veiny rather villous, Leaf stalks partly winged
512 Leaves cordate oblong acuminate about 7-nerved unequal at the base
513 Lower leaves cordate stalked 7-nerved upper cordate oblong sessile 5-nerved
514 Leaves peltate round cordate many-nerved obtuse sub-repand, Spikes in umbels
515 Leaves roundish cordate acute many-nerved, Nerves and stalks villous, Spikes in umbels
516 Leaves lanceolate ovate nerved, Spikes short
517 Leaves ovate lanceolate tomentose, Stem arborescent
518 Leaves ovate lanceolate acuminate smooth 3-nerved
519 Leaves lanceolate ovate rugose, Nerves alternate

Stem fleshy

520 Leaves ovate acute obsoletely 3-nerv rather folded together at the base, Stalks ciliated, Spikes term solitary
521 Leaves stem-clasping broad lanceolate narrowed downwards many-nerved, Stem simple erect
522 Leaves obovate very obtuse, Flower-stalks terminal branched, Stem and branches rooting
523 Leaves obovate nearly retuse edged with red, Spike terminal solitary, Stem decumbent rooting
524 Leaves wedge-shaped about 7-nerved, Spikes terminal conjugate, Stem rooting nearly erect
525 Leaves oblong lanceolate attenuated 5-nerved, Spikes axillary, solitary, the terminal in pairs, Stem winged
526 Leaves lanceolate ovate 5-nerved acute at each end, Spikes terminal 2 or 3 together, Stem nearly erect
527 Leaves ovate acuminate 5-nerved, Spikes conjugate erect, Stem branching rooting
528 Leaves peltate cordate ovate acute, Stem creeping
529 Leaves cordate acute, Spikes lateral and terminal, Stem procumbent
530 Leaves oblong nerveless opposite spikes axillary solitary, Stem pubescent upright
531 Leaves oblong acute nerveless opposite with the erect stem villous
532 Leaves ternate roundish, Stem creeping
533 Leaves 4 together sub-sessile oblong nerveless, Spikes terminal, Stem erect
534 Leaves 3 and 4 together oblong 3-nerved smooth coriaceous, Spikes terminal solitary
535 Leaves 3 and 4 together elliptic lanceolate 3-nerved with the upright stems villous
536 St erect round smth Lvs 4-6 togeth ses lanc. atten at base 3-nerv very smth Sp ter very long sol or double
537 Leaves 3 and 4 together roundish rhomboidal stalked 3-nerved pubescent, Branches erect
538 Leaves 4 together wedge-shaped emarginate sub-sessile, Spikes solitary, Stem erect
539 Very fragrant, Leaves 4, 5, and 6 together sub-sessile reflexed sub-emarginate, Spikes terminal about 4
540 Leaves 3 and 5 together oblong acuminate 3-nerved smooth, Stem erect
541 Hoary with down, Leaves alternate thick round-ovate with a small blunt point, very cordate at the base
542 Leaves obovate rounded stalked very thick green naked
543 Leaves about 4 together roundish convex beneath and coloured, Spikes terminal and axillary sub-solitary

and Miscellaneous Particulars

planted, and afterwards staked with any rough barked wood, on which the plants climb and attach themselves much in the manner of our five-leaved ivy (Ampelopsis). In Sumatra, Marsden informs us (Hist. 107), a tree called the chinkareen is planted for the support of the pepper plant, as the common maple and flowering ash is for the vine in Italy. The shoots bear in the third year, the flowers appear in June, and the berries are ripe, and of a blood-red in September The shoots are then cut down to the ground, and the berries gathered, dried in the sun, and sorted In three or four years more the shoots have attained full growth, and another crop is ready

P. amalago, longum, and various other species afford berries differing very little in quality from those of P nigrum, and sometimes mixed with, or substituted for them.

P betle affords the betel leaf of the southern Asiatics, which serves to enclose a few slices of the areca nut (thence commonly called the betle-nut), and a little shell lime. This, the inhabitants of those countries chew to sweeten the breath, strengthen the stomach, and ward off the calls of hunger, as the European working classes do tobacco It is deemed the extreme of unpoliteness in the east to speak to a superior without a *quid* of betel in the mouth. The teeth of the men in Malabar are ruined by it; but the women preserve theirs to an old age, by staining them black with antimony Such is the consumption of betel in the east, that it occasions a branch of commerce nearly as extensive as that of tobacco in the west.

All the species of pepper introduced in our stoves grow freely in loam and peat, require but little water, and are readily propagated by cuttings

Class III. — TRIANDRIA. 3 Stamens.

This class, which is larger than the two preceding, contains most of the genera of three considerable and very natural orders, the Irideæ, Cyperaceæ, and Gramineæ. The first are chiefly bulbous-rooted sword-leaved plants, with brilliant but transient flowers, the second, sedgy grass-like plants, more curious than useful; and the third, the proper grasses, an order which contributes more extensively and effectually to the support of man and domestic animals than any other, and, unless we except Lolium temulentum, containing no poisonous plant The genera of the grasses, Sir J. E. Smith observes, are not easily defined Schreber and Dr Host among the Germans, and Stillingfleet and Curtis, and more recently, Mr R. Brown, in this country, have paid much attention to the order, but it is among the French that the greatest improvements have been made in the arrangement and distribution of the genera The principal graminologists in that country have been Messrs Desvaux, Palisot de Beauvois, and Kunth, each of whom has divided the Linnæan genera into many others, the greater part of which have been admitted by other botanists, and are consequently adopted here It must, however, be confessed, that if much has been done in remodelling the grasses, yet more remains to be effected, and that much more perspicuity and clearness of definition will be required before their arrangement can be said even to approach perfection In describing the essential characters, the phraseology of the continental botanists has been adopted This not being very familiar to readers in this country, the following explanation of terms may be useful.

The parts here called *Glumæ* are the *Calyx* of Linnæus
Paleæ . . . *Corolla*
Scale . *Nectary*

The terms calyx and corolla applied to the floral envelopes of grasses are improper, as they are not analogous to those organs in other plants, but are rather to be considered as a form of Bracteæ, as are also the inner scales, called Nectarium by Linnæus It has been considered by some writers, proper to place all the grasses in Triandria, without reference to the number of their stamens, but this is manifestly improper, as the whole merit of the artificial system depends upon its principles being closely followed The grasses not in this class are to be found in Monandria, Diandria, Hexandria, and Polygamia The grasses, in an œconomical point of view, have been scientifically experimented on by Sir H. Davy, and Mr Sinclair, the duke of Bedford's gardener at Woburn

Galaxia and Ferraria, which Persoon has placed in this class, we have, with Willdenow, placed in Monadelphia. Tigridia will also be found there The following plants are Triandrous, but as they belong to very natural genera, botanists have deemed it better not to separate them

MONOGYNIA Narcissus triandrus Juncus conglomeratus and effusus Rivina brasiliensis, and some species of Amaranthus, &c Galium trifidum, some Asperulas, Melothria, Laurus triandra, Fagara spinosa and acuminata, Hirtella triandra, Tradescantia multiflora.

DIGYNIA Tripsacum hermaphroditum, some species of Ehrharta, &c

TRIGYNIA Tillæa muscosa, Elatine triandra, Stellaria media, some species of Xanthoxylum, Triplaris americana, &c

Order 1. MONOGYNIA  3 Stamens 1 Style

1 *Flowers with Calyx and Corolla distinct, or with a trifid Corolla only*

78 *Valeriana* Cal very small, finally enlarged into a feathery pappus. Corolla monopetalous, 5-lobed, regular, gibbous at the base Capsule 1-celled

79. *Patrinia* Cal very small, finally enlarged into an irregularly and obsoletely toothed rim Corolla monopetalous, 5-lobed, regular, gibbous at the base Capsule 3-celled, supported on one side by an oval membranous bractea Stamens variable (3 or 5)

80 *Valerianella* Cal very small, finally becoming a straight rim Cor monopetalous 5-fid, regular Capsule 3-celled

81 *Calymenia* Cal 5-fid campanulate Cor funnel-shaped Nut 1-seeded, surrounded by the enlarged calyx

82 *Loeflingia* Cal. 5-leaved, the leaves 2-toothed at the base Cor of 5 petals, which are very minute and connivent Stigma 3-ple Caps 1-celled, 3-valved, many-seeded

83. *Hippocratea* Cal 5-leaved, very small Pet. 5 dilated at the base, hooded at the end Nut fleshy, bearing the stamens. Caps 3, compressed, 2-valved, opening in the middle, 1-celled, with 2-5 compressed winged seeds

84 *Cneorum.* Cal. 3-4-toothed, persistent, small Pet. 3-4 equal. Stigma 3-fid. Drupes 3 or 4 clustered, dry

85 *Comocladia.* Cal. 5-parted Pet 3, larger than the calyx Drupe with 3 spots at the end, and a membranous 1-seeded nut (Stamens and petals vary to 4)

86. *Xyris* Cal 3-valved, cartilaginous, clustered in a head Cor 3-petaled, equal. Caps. 1-3-celled, 3-valved. Stigma 3-fid.

87. *Callisia* Calyx 3-leaved Petals 3. Anthers double Capsule superior, 2-celled, 2-seeded, compressed. Stigmas 3, finely divided

88 *Commelina.* Cal. 3-leaved Pet. 3 Filaments 3 or 4-sterile, furnished with crossing glands Caps. 2-3-celled. Seeds fixed to the valves

89 *Ancilema* Like Commelina, but no involucrum Stamens 6. Anthers 3, sometimes 2-4, dissimilar.

90. *Cartonema.* Cor persistent the 3 outer leaves calycine Stamens persistent, beardless Seeds 2

2 *Flowers with a 5-parted Calyx, and no Corolla.*

91 *Ortegia* Cal. 5-leaved Stigma headed. Caps 1-celled, 3-valved at the end Seeds many, affixed to the bottom of the capsule Stigma 1-3

92 *Polycnemum* Cal. 5-leaved Seed 1, in an utriculus

3. *Flowers 6-parted, coloured the Calyx and Corolla not distinct*

93 *Crocus.* Spatha usually 2-valved Flower funnel-shaped, regular · the outer segments largest. Tube very long, partly under ground. Stigma deeply trifid, with convolute segments

94 *Witsenia* Flower tubular, with a 6-parted limb Stigma slightly trifid or emarginate. Caps 3-celled, many seeded.

95. *Ixia.* Spatha 2-valved Flower with a slender tube and regular limb. Stigmas 3, narrow, recurved. Caps. globose, ovate.

96. *Trichonema.* Spatha 2-valved Flower with a very short tube and an equal regular limb Filaments pubescent Stigmas 3, 2-parted

97. *Geissorhiza* Spathia 2-valved Flower tubular, with a 6-parted spreading regular limb. Style inclined. Caps. oval, 3-cornered.

98. *Hesperantha.* Spatha 2-valved Flower tubular, with a 6-parted regular limb Stigmas 3, divided as far down as the tube Caps oblong 3-cornered.

99. *Sparaxis.* Spatha 2-valved, scarious, membranous, torn at the end. Flower tubular. Stigmas 3, recurved. Caps. oblong, globose.
100. *Tritonia.* Spatha 2-valved. Flower tubular, with a 6-parted nearly regular limb. Stigmas 3, spreading. Seeds neither winged nor berried.
101. *Watsonia.* Spatha 2-valved. Flower tubular, with a 6-parted limb. Stigmas 3, filiform, 2-parted, with recurved segments. Caps. cartilaginous, many-seeded
102. *Babiana.* Spatha 2-valved, the inner valve 2-parted. Flower tubular, with a 6-parted limb. Stigmas 3, spreading. Seeds berried
103. *Lapeyrousia.* Flower hypocrateriform Tube longer than the 6-parted limb. Stigmas 3, 2-parted. Caps. membranous, many-seeded
104. *Melasphærula.* Spatha 2-valved. Flower nearly divided into 6 petals: the segments pointed equal. Stigmas 3, recurved. Caps. 3-lobed.
105. *Gladiolus* Spatha 2-valved. Flower tubular, with a 6-parted irregular limb Stamens ascending. Stigmas 3. Seeds winged.
106. *Anomatheca.* Spatha 2-valved. Flower hypocrateriform. Stigmas 3, 2-parted. Caps frosted over with little warts
107. *Antholyza.* Spatha 2-valved. Flower tubular, with a ringent differently formed limb Stigmas 3, simple. Seeds nearly round.
108. *Xyphidium.* Flower inferior, 6-petaled, regular Caps 3-celled, many-seeded
109. *Leptanthus.* Flower monopetalous, with a very long slender tube, a 6-parted limb, and nearly equal segments Stigma simple.
110 *Wachendorfia.* Flower inferior, 6-parted, irregular. Caps 3-celled Seeds solitary
111. *Hæmodorum.* Flower 6-parted, persistent, smooth Stamens attached to the base of the inner segments of cor. Ovarium 3-celled. Cells 2-seeded. Stigma 1. Caps ½-superior, 3-lobed, 3-celled Seeds peltate, edged
112. *Aristea* Flower superior, 6-petaled, regular, after flowering twisted spirally and persistent. Caps. 3-celled, many seeded.
113 *Dilatris.* Flower superior, 6-petaled, regular One filament shorter than the others, and with a larger anther. Stigma simple. Caps 3-celled. Seeds solitary.
114. *Brodiæa* Flower inferior, tubular, with a 6-cleft regular limb, and a 3-leaved corona in the orifice Caps. 3-celled, many seeded.
115 *Iris.* Flower 6-parted: every other division reflexed. Stigmas shaped like petals
116. *Moræa* Flower 6-petaled, after flowering involute above, spirally twisted beneath, finally falling off. Caps many-seeded.
117. *Marica.* Flower 6-parted, or of 6 petals: the 3 outer segments largest, the inner connivent and very much smaller. Stigma like a petal, 3-fid its segments undivided Caps 3-celled
118 *Pardanthus.* Flower 6-petaled, regular, equal. Caps many-seeded Seeds attached to a central loose receptacle.

4 Flowers glumaceous

α, Leaves with an entire Sheath *Sedges*

119. *Schænus* Spikelets few-flowered, distichous the lower scales empty, the upper enclosing flowers. No bristles under the ovarium
120 *Rhynchospora* Spikelets few-flowered, slender the lower nearly empty, the upper enclosing flowers. Bristles under the ovarium
121. *Fimbristylis* Spikelets imbricated in all directions, many-flowered, none of the scales empty Style jointed at the base, and deciduous. No bristles under the ovarium
122. *Isolepis* Spikelets imbricated in all directions, many-flowered, none of the scales empty. No bristles under the ovarium. Style not jointed at the base, and deciduous
123. *Scirpus* Spikelets imbricated in all directions, many-flowered, none of the scales empty Bristles under the ovarium Style not jointed at the base, and deciduous
124 *Eleocharis.* Spikelets imbricated in all directions, many-flowered, none of the scales empty Bristles under the ovarium. Style jointed at the base, and deciduous
125. *Eriophorum.* Glumes chaffy imbricated in all directions Seed surrounded by very long dense wool
126. *Trichophorum.* Spikelets nearly ovate, imbricated in all directions Bristles about the seed usually six, capillary, finally very much lengthened and exserted
127 *Cyperus* Spikelets in two ranks, imbricated, nearly all the scales enclosing flowers No bristles under the ovarium. Style deciduous, not bulbous
128. *Papyrus.* Spikelets many-flowered Glumes imbricated in two rows, 1-flowered Style 3-fid. Scales 2, membranous, contrary to the glumes No bristles beneath the ovarium. Seed 3-cornered
129 *Kyllinga* Spikelets 1-flowered. Glumes 4, imbricated in two rows, compressed the 2 lower which are smaller and the upper one empty, the intermediate similar to the upper, and including a naked hermaphrodite flower. Style bifid No bristles under the ovarium Seed lenticular
130 *Mariscus.* Spikelets few-flowered. Glumes imbricated in two rows, the lower empty. Stamens sometimes 2. Style trifid Neither scales nor bristles below the ovarium Seed triangular

β Leaves with a split sheath, and a membranous ligule *True grasses*

131. *Remirea.* Spikelets 1-flowered, with imbricated scales, the outer ones nerved, the upper which bears the flower enclosed in them and unlike them. No bristles beneath the ovarium. Seed oblong, enclosed in the uppermost scale become thickened and corky
132 *Lygeum.* Flowers 2 or 3 together, with two valved glumes, at the base united into a 2-celled villous pericarpium. Involucrum a convolute spatha.
133. *Cornucopiæ.* Involucre 1-leaved, cup-shaped or funnel-shaped, many-flowered. Glumes 2-valved, united at base, mitre-formed, equal Palea 1, bladder-like, split on one side, with a beard below the middle. Stigmas long. Seed not furrowed. Flowers in a head.
134. *Cenchrus* Involucrum 1-3-flowered, many parted, bristly without, finally hardened. Glume 2-flowered, 2-valved. the outer valve smallest. Florets dissimilar the outer male or neuter, the inner hermaphrodite No scales.
135 *Pennisetum.* Involucrum double, composed of many bristles the outer unequal, the inner pinnated, bearded. Spikelets 2-3-5. Glume 2-valved, unequal. Lower floret male, upper hermaphrodite, both sessile. Paleæ nearly cartilaginous. Spike compound, with sessile spikelets
136. *Spartina.* Glume 3-valved, 1-flowered, unequal, keeled, very acute Paleæ 2, beardless, bifid, emarginate and toothed, shorter than the glumes Scales fringed Style very long Seed loose, covered with the paleæ Spikelets 1-sided, inserted in a double row Spike compound
137. *Nardus.* Glume 1-valved, 1-flowered Palea 1. Stigma simple Seed covered by the palea.
138. *Oryzopsis* Glume 2-valved, 1-flowered, membranous, a little longer than the hardened paleæ Paleæ 2, the lower villous at the end with a jointed beard, the upper entire. Scales 2, linear, the length of the ovarium Panicle nearly simple and loose

Order 2. DIGYNIA.  3 Stamens. 2 Styles

1. *Inflorescence spiked or panicled. Spikelets either solitary, in pairs, or several together, one or more usually 2-flowered, one of the flowers being sterile or of only one sex Glumes usually of a thinner texture than the Paleæ, which are more or less cartilaginous, the lower one half enfolding the upper, and either beardless or occasionally bearded; neither of them with a keel.* (PANICEA)

139. *Paspalum* Glume 2-valved, 1-flowered, closely pressed to the two plano-convex paleæ. Seed coated with the paleæ. Flowers spiked, attached to one side of the toothed rachis.

140. *Axonopus.* The inflorescence digitate. Spikelets simple. Otherwise, as Paspalum.
141 *Milium.* Glume naked, beardless, 2-valved the valves concave, larger than the paleæ, which are two, concave and equal. Seed coated with the indurated paleæ
142 *Knappia* Glume 1-flowered, 2-valved, truncate, beardless Palea one, torn, the divisions setigerous and united at the base, enfolding the stamens and pistillum. Flowers alternate in a flexuose rachis. Seed loose.
143. *Digitaria* Inflorescence digitate or fascicled Spikelets 1-sided, flower-stalks 2-, or many-flowered. Glume 2-valved, the lower valve very minute Of the lower neuter floret the paleæ membranous. Of the upper hermaphrodite floret the paleæ subcoriaceous, hardened. Seed slightly furrowed.
144 *Panicum* Glume 3-valved valves unequal, the outer being very small. Paleæ two, concave, equal, beardless Seed coated with the hardened paleæ Panicle scattered and loose
145. *Setaria.* Has the same character as Panicum, except that the panicle is spiked.
146 *Echinochloa.* Has the character of Panicum, except that the panicle is composed of alternate spikelets, and the third valve of the glume is bearded
147 *Orthopogon.* Has the character of Echinochloa, except that both the intermediate and third valves of the glume are bearded.
148 *Penicillaria.* Involucrum bristly the bristles equal, pinnated, bearded. Glume 2-valved, very small, membranous Lower floret male, upper hermaphrodite the paleæ subcartilaginous and entire. Anthers villous at the end Spike compound, cylindrical, with stalked involucrated spikelets.
149. *Lappago* Glume 2-valved, valves unequal the lower very minute, membranous, the upper cartilaginous, very large, with soft prickles Paleæ 2-valved, membranous, shorter than the glume. Scales very small, fringed. Panicle simple spike-shaped, the branches 3-flowered.

2. *Inflorescence panicled Spikelets solitary, 1-flowered Glumes membranous, the lower Paleæ coriaceous, bearded, enfolding the upper, which has not two Keels.* (Stipacea.)

150 *Stipa.* Glume 2-valved, 1-flowered, membranous, longer than the two cartilaginous paleæ, of which the lower is convolute, with a long beard at the apex, upper entire Beard jointed at the base, deciduous. Scales oblong, entire. Seed furrowed. Panicle almost simple, lax

3. *Inflorescence panicled, sometimes contracted into the form of a spike. Spikelets solitary, 1-flowered. Glumes and Paleæ of nearly similar texture, most usually with a Keel Lower Paleæ either bearded or beardless, the upper never with two Keels* (Agrostidea)

151 *Muhlenbergia.* Glume 2-valved valves very minute, fringed, three times as short as the paleæ, the lower of which has a bristle Scales ovate, obliquely truncate, gibbous Seed naked, not furrowed. Panicle nearly simple, contracted or spreading
152 *Chæturus* Lower valve of the gluma with a long bristle, upper acute Paleæ membranous, the lower valve trifid, upper bifid Flowers spiked, inserted into the elongated teeth of the rachis.
153. *Lagurus* Glume 2-valved, 1-flowered, each valve ending in a villous beard. Outer paleæ with two terminal beards, and a third, which is dorsal and twisted back Panicle spike-shaped, ovate, hairy
154 *Polypogon* Glume 2-valved, 1-flowered valves nearly equal, obtuse at the end with a long bristle, much longer than the somewhat cartilaginous paleæ Lower palea below its end, which is entire, with a straight short tender bristle, upper bifid, toothed Panicle contracted, like a spike.
155 *Gastridium.* Glume 2-valved valves ventricose at the base, 3 times as long as the hardened coriaceous paleæ Paleæ 2, the lower 3-4-toothed with a bristle under the end, the upper bifid, toothed. Panicle compound, contracted like a spike
156 *Agrostis* Glume naked, beardless, 2-valved valves concave, longer than the paleæ, which are 2, and enclose the seed.
157 *Trichodium* Glume 2-valved, 1-flowered Palea one, shorter than the glumes, bearded, and supported at the base by one or two fascicles of hairs Seed loose, covered by the palea
158 *Tristegis* Glume naked, 3-valved valves concave, the outer very small, the intermediate longer than the paleæ, the third bearded Paleæ 2, concave, equal, obtuse, beardless Seed inclosed in the paleæ.
159 *Sporobolus* Glume naked, beardless, 2-valved valves concave, much shorter than the paleæ, which are two, concave, nearly equal, beardless Seed not inclosed in the paleæ
160 *Atropis* Glume 2-flowered valves nearly equal, navicular, longer than the florets. Lower paleæ trifid at the end, upper entire Seed loose, not furrowed. Panicle contracted, compound.
161. *Cinna* Glume naked, beardless, with 2 concave valves shorter than the paleæ, which are 2, nearly equal, concave, with long points the outer one being bearded or beardless Seed enclosed in the paleæ
162. *Psamma* Glumes nearly beardless Paleæ under the end emarginate, mucronate, shorter than the glumes Scales 2, subulate Style 3-parted. Seed turbinate Spike compound, erect, cylindrical.
163 *Crypsis* Glume 2-valved, 1-flowered, compressed, unequal. Paleæ 2, unequal, longer than the glume. Seed loose, covered by the paleæ
164 *Alopecurus* Glume 2-valved, 1-flowered valves somewhat equal, connate, distinct. Paleæ united into a bladder-like glume split on one side, below the middle (generally), bearded Scales linear, entire. Spike compound, contracted, without involucrum, branches very small, branching
165 *Phleum.* Glume 2-valved, naked, with a point or little beard out of the nerve at its back: valves navicular, including the paleæ, which are 2, navicular and beardless Beard of the glume lengthened. Second floret sessile
166 *Achnodonton* The character of Phleum, except that the beard of the glume is very minute.
167 *Chilochloa* The character of Phleum, except that the second floret is stalked
168 *Phalaris* Glume 2-valved, naked, beardless the valves navicular, inclosing the paleæ, which are two, and navicular also, beardless and naked at the base, but supported by hairs or accessory glumes.

4. *Inflorescence panicled. Spikelets solitary, 2 or many-flowered Glumes with a keel. Paleæ of nearly the same texture as the glumes, the lower carinate or concave, always bearded, the upper with two keels* (Bromea)

169 *Corynephorus* Glume 2-flowered. Valves membranous, longer than the florets Lower palea entire, having at its base a beard, jointed in the middle, woolly, twisting and small below, clavate above, upper bifid-toothed. Panicle compound
170 *Aira.* Spikelets slender. Glume 2-flowered, rarely 3-flowered, beardless, 2-valved, equal to the florets or shorter One of the florets on a stalk Paleæ 2, equal, enclosing the seed when ripe.
171 *Avena* Glumes membranous, 2-7-flowered, longer than the florets. Lower palea twice torn, or, with the upper, bifid-toothed, sometimes eroded, having at the back a plaited twisted beard. Scales ovate. Seed coated, furrowed. Panicle compound, loose
172. *Trisetum.* Lower palea with 2 bristles and a tender flexuose beard above the middle of its back. Scale lanceolate. Other characters of Avena
173. *Danthonia.* Lower palea 2-toothed, with a plaited twisted beard from between the teeth, upper obtusely truncated. Seed loose, not furrowed Panicle simple Other characters of Avena.
174. *Gaudinia.* Glume unequal, obtuse. Lower palea bifid-toothed, bearded at the back above the middle: the bearded twisted and plaited. Upper palea 2-4-toothed. Seed coated, furrowed. Spikelets sessile, alternate, with 9 11 2-ranked flowers.
175 *Arundo.* Glume naked, beardless, 2-valved: the valves wrapping up the paleæ which are 2-bearded and surrounded by bristles. Seed inclosed in the paleæ
176. *Chrysurus — Neuter spikelet.* Glume linear, subulate, with remote florets. Paleæ 1, sterile. *Hermaphrodite spikelet*, 1-flowered Glumes subulate, linear Floret stalked. Lower palea below its end, which is entire, setigerous, the upper entire Seed with two beards, not furrowed. Panicle compound, branching.
177 *Scalcria.* Common involucrum many-leaved: the leaflets sometimes deciduous. Glume 3-4-flowered.

Valves unequal, shorter than the stalked florets. Lower palea irregularly 2-toothed, setigerous. Scales longer than the ovarium, subulate. Spike compound.

178. *Cynosurus.* Involucrum 1-leaved, with pinnatifid divisions, containing two spikelets Glume 4-5-flowered, shorter than the florets. Lower palea very acute, upper bifid-toothed. Scales hairy. Seed coated, furrowed. Spike compound.

179. *Koleria* Spikelets compressed. Glume 2 or 3-flowered, beardless, 2-valved. the valves shorter than the lowest floret. Paleæ 2, the outer beardless or bearded under the point

180 *Dactylis* Many spikelets heaped in a head, 1-sided. Glume 2-7-flowered. Lower palea under the end, which is emarginate, setigerous, upper bifid, toothed. Scales hairy. Seed loose, not furrowed. Panicle compound with short branches

181. *Glyceria* Spikelet slender. Glume 5-7-flowered. Valves 2, truncate, with transparent membranous edges, shorter than the florets Lower palea eroded or many-toothed, navicular, embracing the upper, which is bifid-toothed Scales connate Seed furrowed Panicle nearly simple

182. *Festuca* Glume beardless, 2-valved valves nearly equal, shorter than the lowest floret. Paleæ 2, the outer one bearded at the end Seed inclosed in the paleæ

183 *Mygalurus.* Glume 1 or 2-valved, many-flowered, shorter than the spikelet. one valve very small Paleæ 2, one of them bearded near the end Seed inclosed in the paleæ.

184. *Bromus.* Glume 3-20-flowered Valves shorter than the florets, which are imbricated in two rows. Lower palea cordate, emarginate below the end, sometimes torn in two, with a straight beard. Scales ovate, smooth Seed coated, furrowed Panicle compound

185 *Brachypodium* Spikelets stalked, alternate in each tooth of the rachis Stalks broad and thick. Glume 3-15-flowered Valves shorter than the florets Paleæ entire, lower setigerous at the end, upper bluntly truncated, generally edged with stiff reflexed hairs Scales pilose Seed coated, furrowed

186 *Uniola* Spikelets compressed Florets imbricated in two rows, the lower only abortive Glume 3-20-flowered, shorter than the florets Lower palea navicular at the end, abruptly cut off and mucronate between the lobes, the upper subulate, somewhat bifid-toothed. Scales bifid. Seeds turbinate, with two horns, not furrowed Panicle compound, loose

187. *Tricuspis* Glume 5-7-flowered Valves navicular, shorter than the florets. Lower palea bifid-toothed, between the teeth and on each side mucronate the upper truncate, almost emarginate Seed 2-horned

188 *Diplachne* Glume 7-9-flowered the upper valve mucronate at the end Lower palea twice torn, with a bristle beneath the divisions, upper sub-truncate, emarginate. Seed not furrowed Panicle simple, much branching Branches alternate, filiform

189 *Ceratochloa* Glume 12-18-flowered Valves shorter than the florets Paleæ bifid-toothed the lower mucronate between the teeth Ovarium 3-horned Seed coated, furrowed, 3-horned Panicle nearly simple Spikelets compressed Florets imbricated in two rows

190 *Schismus.* Glume 3-6-flowered Valves the length of the florets, or longer Lower palea cordate, emarginate, its rib extended between the lobes into a filiform mucro, the upper entire. Seed obtuse, nearly furrowed. Panicle simple, contracted, spike-shaped.

191. *Triodia* Glume 3-5-flowered Valves navicular, longer than the florets Paleæ bifid-toothed lower with a thick tooth-shaped mucro between the teeth Scales lanceolate, smooth Ovarium with a bifid diverging beak.

192 *Beckmannia* Spikelets 1-sided, 3-5-flowered Glumes unequal, navicular, with a little stalk at the base, obtuse at the end, spatulate, nearly the length of the florets Paleæ nearly equal. Scales lanceolate. Seed loose, not furrowed. Spike compound 3 spikelets in each tooth of the rachis

193 *Melica.* Glume unequal, 2-5-flowered, membranous, nearly the length of the florets, of which the upper are incomplete, abortive and stalked. Scales truncate, fringed. Seed loose, not furrowed. Panicle simple or compound

194. *Molinia* Glume 2-4-flowered, unequal Paleæ comical, lanceolate, acute, much longer than the glume, the upper barren and abortive, or often in its place, a formless rudiment. Scales subtruncate Seed with two points from the remains of the style, with a broad furrow Panicle compound. Spikelets slender

195 *Briza* Glumes navicular, compressed, nearly cordate at the base, many-flowered (3-14), shorter than the florets which are imbricate in two rows Lower palea cordate at the base, embracing the upper, which is nearly round and much shorter Seed with two short filiform beaks Panicle compound, loose, branches pendulous

196 *Poa* Glume 2-20-flowered Valves shorter than the florets Paleæ sometimes woolly at the base, the upper bifid-toothed Scales smooth Seed furrowed Panicle more or less branching or scattered

197 *Eragrostis* Glume 4-10-flowered Valves shorter than the paleæ, which are imbricated in two ranks Upper palea reflexed, its edges folded back, shell-shaped, entire, fringed, persistent. Seed loose, 2-horned, not furrowed. Panicle compound, more or less scattered

198 *Megastachya* Spikelets elongated the florets imbricated in two rows Glume 5-20-flowered. Valves shorter than the florets Lower palea emarginate, with a point between the divisions, upper bifid-toothed Seed loose, not furrowed. Panicle compound

5 *Inflorescence spiked Spikelets solitary, seldom many-flowered, with the upper flower abortive and differently formed Glumes with a keel, not opposite Lower palea generally bearded, seldom beardless, the upper with two keels* (CHLORIDEÆ)

199 *Sclerochloa* Glume 3-5-flowered Valves obtuse, shorter than the florets Lower palea cordate, emarginate, obtuse, upper entire Scales emarginate Seed with a bifid beak Spike simple Spikelets 1-sided or dichotomous

200 *Eleusine* Glume 5-7-flowered Valves obtuse Paleæ obtuse, upper bifid-toothed Scales truncate, fimbriate Seed inclosed in a separate membrane, broadly and deeply furrowed Inflorescence digitate Spikelets 4-5, erect, 1-sided

201. *Dactyloctenium* Spikelets 1-sided Glume 5-7-flowered Lower valve with a falcate spine shaped mucro. Lower palea navicular, ventricose, subulate, upper bifid-toothed. Scales truncate, fringed. Seed square, warted, obtuse, loose Spikelets digitate, 4-5, erect or horizontal

202 *Leptochloa* Glume 3-5-flowered Valves lanceolate, acute, nearly as long as the florets. Lower palea navicular, acute, upper bifid-toothed Seed loose, furrowed Panicle simple Branches alternate, simple, with nearly 1-sided spikelets

203 *Cynodon* Spikelets 1-sided in a simple row Glumes membranous, persistent, shorter than the florets, and only embracing them at the base. Fertile floret with the upper palea bifid-toothed A rudiment of an abortive floret, stalked, smooth, clavate Scales truncate Seed loose, not furrowed Spike digitate Spikelets 4-5-filiform, simple, slender

204. *Dinebra* Glume 2-5-flowered Valves subulate Paleæ bifid, emarginate, the lower setigerous under the end Scales truncate, or somewhat lanceolate Inflorescence spiked, acuminate, the point of the rachis protruding beyond Spike simple or compound Spikelets 1-sided, alternate, remote, pendulous

205 *Echinaria* Spikelets close together Glume 2-4-flowered Valves mucronate, shorter than the florets Lower palea truncate, fringed, terminated by 5 lanceolate unequal bristles, upper cordate, emarginate, with two similar bristles. Scales truncate. Seed loose, gibbous, not furrowed, with two diverging beaks Spike simple, capitate

6. *Inflorescence spiked Spikelets solitary, in pairs, or several together, 1-flowered, or many-flowered Glumes opposite, equal Lower palea bearded or beardless, upper with two keels* (CEREALIA)

206 *Triticum* Glume 2-valved, many-flowered, shorter than the spikelet the valves nearly equal, bearded, or with one beard enclosing the florets Paleæ 2, one of them being bearded from the end Seed inclosed in the paleæ, rarely otherwise

207. *Lolium* Spikelets sessile, to the lowest a glume of one valve, to the uppermost of two opposite valves Lower palea with a mucro or bristle at the end, upper membranous, bifid-toothed. Scales with two unequal teeth Seed furrowed.

208 *Elymus.* Spikelets in each tooth of the rachis two or more, 3-9-flowered Glume 2-valved, nearly equal, rarely (as in E. Hystrix) absent or nearly so Lower palea entire with a bristle which is sometimes very short, upper somewhat bifid-toothed Scales ovate, hairy Seed furrowed Spike simple

209 *Secale* Spikelets in each tooth of the rachis solitary, 2-3-flowered, the two lower florets fertile, sessile, opposite, the upper abortive Glumes subulate, opposite, entire, shorter than the florets. Lower palea entire, with a very long bristle, upper bifid-toothed Scales obovate, hairy Seed coated, furrowed

210 *Hordeum* Spikelets 1-flowered, three together, the two lateral often barren Glumes 2, subulate Paleæ 2, the lower bearded. Scales 2. Stigmas feathery Seed coated with the paleæ

211 *Macrochloa.* Spikelets 1-flowered. Glumes 2, membranous, beardless Paleæ 2, much shorter than the glumes, villous Stigmas very finely divided.

212 *Ophiurus* Glumes cartilaginous, half immersed in hollows of the rachis, longer than the floret. Paleæ membranous, transparent Ovarium cordate Spike simple

213 *Monerma* Spikelets half immersed in hollows of the rachis Glume 1-valved, cartilaginous, furrowed. Paleæ membranous, transparent Scales lanceolate, entire, smooth Spike simple Rachis jointed, toothed.

7 *Inflorescence spiked, or panicled, jointed Spikelets generally in pairs, 1 or 2-flowered, the one sessile, the other stalked, and usually of one sex only Glumes of a stouter texture than the paleæ, neither keeled nor opposite Paleæ very delicate and membranous, not with a keel, the lower commonly bearded.* (SACCHARINA)

214 *Perotis* Glume 2-valved valves with a long bristle at the end Palea 1, nearly as long as the calyx. Spike nearly simple, involucrated at the base, with woolly hairs

215 *Saccharum* Glume 2-valved, 2-flowered, enveloped in long wool Lower floret neuter with one palea, upper hermaphrodite with two paleæ, the upper of which is very small or obsolete

216 *Imperata* Glume 2-valved valves herbaceous, at the lower part of the back clothed with very long hairs the length of the paleæ, which are two, and beardless, the lowest only half the size of the other Scales none Stamens 2-3

History, Use, Propagation, Culture,

78 *Valeriana* A word of uncertain import Linnæus derived it from a certain king Valerius. De Théis thinks it altered from the verb *valere*, on account of its medicinal qualities The species are generally ornamental border plants, of easy culture in common earth, and preferring shady moist situations V. dioica has usually the stamens and pistils in separate flowers, situated on different plants This species and V officinalis are considered medicinal, and prescribed in hysterical cases and habitual costiveness Cats are delighted with the roots, which are said to smell like the true Teucrium marum, and rat-catchers employ them to draw the rats together, as they do oil of anise. V Phu has something of the same qualities V. tripteris derives its name from τρεις three, and πτερυξ, a wing, in allusion to the ternary position of its leaves.

8. *Inflorescence panicled Spikelets solitary, 1-flowered Lower paleæ cartilaginous, compressed, keeled Stamens frequently more than 3* (ORYZA)

217 *Leersia* Spikelets 1-flowered Glumes 0 Paleæ 2, beardless, keeled, compressed Scales 2. Stamens 3-6 Stigmas very finely cut Seed loose, inclosed in the paleæ.

9 *Shrubby Inflorescence panicled Spikelets many-flowered Upper palea with two keels* (BAMBUSACEÆ)

218 *Diarrhena* Glume 2-valved valves navicular, rigid, the lower smaller, shorter than the florets Lower palea navicular, rigid, upper membranous, the edges broad, folded back. Scales 2, ovate, entire Ovarium with a hood Seed furrowed, hardened, shining, loose

219 *Arundinaria* Glume 5-7-flowered Valves unequal, with stalked florets Lower palea very acute, upper bifid-toothed. Scales 3, smooth Stigmas 3, feathery Styles 3

Order 3. TRIGYNIA  3 Stamens 3 Styles

220 *Holosteum.* Cal 5-leaved. Petals 5 Caps sub-cylindrical, 1-celled, opening at the end, 6-valved, many-seeded

221 *Polycarpon* Cal 5-leaved, 5-cornered Petals 5, very small, ovate Caps. 1-celled, 3-4-valved valves lanceolate, twisted inwards Seeds many

222 *Lechea* Cal 3-leaved Petals 3, linear Caps 3-celled, 3-valved, and as many inner valves Seed 1.

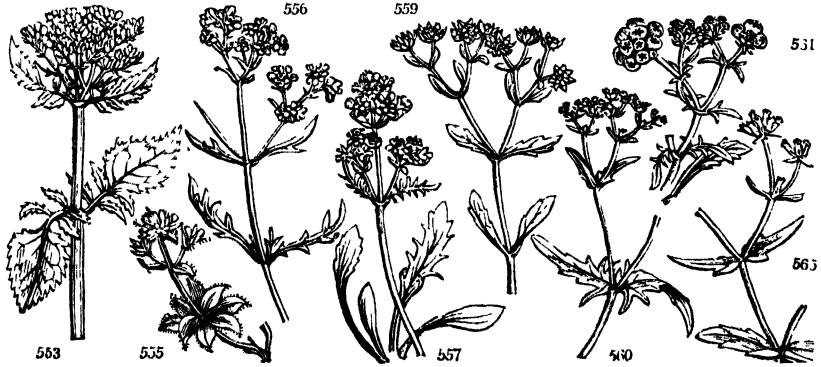
223 *Erucaulon* Common calyx an imbricated head Petals 3, equal Stamens above the ovarium

224 *Montia* Cal 2-3-leaved. Cor monopetalous, irregular, 5-parted Caps 1-celled, 3-valved, 3-seeded

225 *Mollugo* Cal 5-leaved Cor 0 Caps 3-celled, 3-valved

226. *Minuartia* Cal 5-leaved Cor 0 Caps 3-celled, 3-valved Seeds a few.

227 *Queria* Cal 5-leaved or 5-parted Cor 0 Caps 1-celled. Seed 1



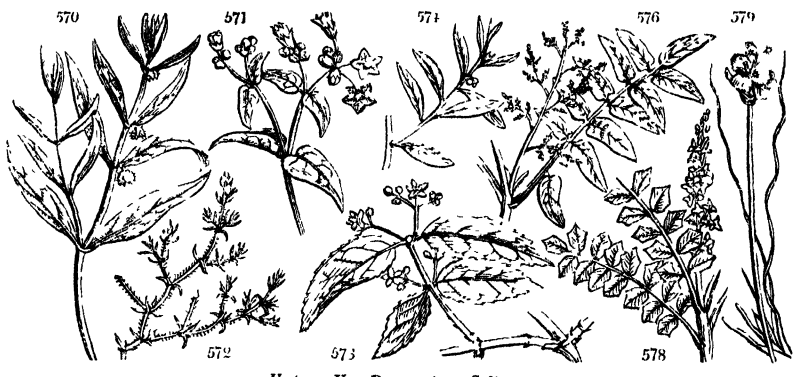
228 *Koniga* Cal 3-leaved Cor 0 Seed 1, ovate, naked.

MONOGYNIA

544 Radical leaves spatulate ovate undivided, cauline pinnatifid, Stem erect, Flowers panicled dioecious
545 Leaves all pinnate pinnæ lanceolate toothed, Stem hollow furrowed, Flowers corymbose
546 Cauline leaves pinnate, radical undivided, Stem smooth slender, Flowers corymbose
547 Leaves toothed radical cordate simple, cauline ternate ovate oblong, Leaflets lateral lanceol Stem erect
548 Leaves oblong rather toothed, lower obtuse, upper acute, Stem erect, Flowers panicled
549 Leaves undivided entire obt radical cuneate obl cauline linear, Stem smooth ascending, Flowers racemose
550 Radical leaves lanceolate oblong entire, cauline pinnatifid, Stem smooth, Flowers pink corymbose
551 Leaves undivided, radical elliptical 3-nerv entire and toothed, caul linear, Stem erect, Corymbs racemose
552 Radical leaves ovate, cauline cordate sessile cut halbert shaped, Flowers racemose
553 Leaves cord uneq toothed lower simple, upper ternate and pinnate, Stem striated, Flowers corymbose
554 Radical lvs pinnated, Leaflets ovate coarsely toothed, caul pinnated downwards, Segm lanceol toothed
555 Leaves simple ciliated, radical obovate, cauline lanceolate, Flowers panicled

556 Leaves membranous pinnatifid, Segm lanceol the terminal very large, Stem smooth, Flowers corymbose
557 Leaves rather fleshy pinnatifid, Segm entire obt of nearly one shape, Stem hairy in 2 rows, Flowers corymb

558 Caps. linear 3-toothed the outer larger recurved, Stem smooth, Flowers in dichotomous spikes
559 Caps naked globose compressed, Stem weak, Flowers in heads
560 Caps polished ovate, Limb of the calyx short 3-5-toothed crowned, Stem smooth, Flowers corymbose
561 Caps ovate villous, Limb of the calyx bladdered crowned, Stem a little villous, Flowers nearly in heads
562 Caps villous, Limb of cal 6-10-tooth crowned, Crown camp Teeth long straight, Stem pubesc Fls in heads
563 Caps vill Limb of cal 10-12-rayed crowned, Crown rotate, Teeth long acute, Stem smooth, Flow in heads
564 Caps naked smooth cleft-keeled elongated, Stem weak, Flowers nearly in heads
565 Caps ovate angular hairy irregularly toothed, Stem angular, Flowers corymbose
566 Caps pubescent naked at the end, Leaves spatulate oblong nearly entire
567 Stem scabrous, Fruit ovate acute 1-toothed at the end pubescent
568 Caps linear 6-toothed, Teeth hooked loose, Stem and radical leaves spatulate, cauline pinnatifid pubescent



and Miscellaneous Particulars

Phu is the Arabic name of the species so called

79 *Patrinia* Named by M Jussieu in honor of M Patrin, an assiduous French botanist, who travelled in Siberia, where all the species of the genus are found, and whence he sent home collections.

80 *Valerianella* A diminutive of Valeriana, from which the genus has been divided Volitoria (Valeriana locusta, *L.*) *Mache salade de prêtre*, Fr, corn salad or lamb's-lettuce, from its appearing in corn fields about the time when lambs are dropped, furnishes an agreeable salad, the leaves tasting little inferior to young lettuce To have it early, it should be sown in autumn on a warm border All the species are of as easy culture as those of Valeriana.

History, Use, Propagation, Culture,

81 *Calymenia* So named from καλυπτω, a calyx, and μηνη, a membrane, on account of the membranous calyx by which the genus is distinguished

82. *Lœflingia.* In honor of P Loefling, a Swedish botanist, who published a volume of travels in Spain, &c. These are plants of no beauty, and are only cultivated in botanic gardens

83 *Hippocratea* In honor of the celebrated Hippocrates, the father of physicians, born in the island of Cos, who flourished 450 years before the vulgar æra Plumier, who first fixed the genus, called it Coa, which Linnæus changed to its present name

84 *Cneorum* Κνεωρον is a plant described by Theophrastus, as resembling the olive This is a low yellowish evergreen shrub, which like Veronica decussata, will endure our winters in the open air, with protection during frost It grows naturally in hot dry barren and rocky soils, thrives well in an artificial state in any light earth, ripened cuttings will root in sand under a hand-glass, or it may be raised from seeds, which it produces in abundance

85 *Comocladia* Κομη, hair, and κλαδος, a branch The branches are tufted at the top of the tree C integrifolia is a handsome tree with an erect trunk, dividing into few branches, adorned with pinnated smooth leaves, like a frond, flowers numerous, fruit a deep red, shining, eatable, but not inviting The wood is hard, of a fine grain, and reddish color If C dentata be ever so slightly wounded, it emits a strong smell of dung it grows in Cuba, where the natives have a notion that it is dangerous to sleep under its shade This genus is not frequent in British collections it thrives in loam and peat, and may be propagated by ripened cuttings placed under a hand-glass in moist heat

569 Villous viscid, Leaves cordate, Flowers racemose, Stamens longer than the corolla
570 Leaves lanceolate, Peduncles axillary solitary, Calyxes 3-flowered, Stem ascending
571 Leaves cordate ovate smooth, Peduncles terminal heaped, Stamens shorter than the corolla

572 Flowers triandrous monogynous, Leaves very small: lower linear, upper subulate

573 Leaves oblong-ovate lanceolate or elliptical serrated, Capsules oval

574 Smooth, Flowers axillary
575 Hoary, Leaves flower-bearing powdery, Petals and stamens 4

576 Leaflets stalked ovate-lanceolate entire
577 Leaflets stalked ovate-lanceolate prickly-toothed
578 Leaflets sessile angular-spiny

579 Leaves linear-subulate, Head globose many-flowered, Petals alternate pencil-shaped
580 Scape slender, Head globose
581 Culm 2-edged and leaves smooth very narrow, Head subovate, Scales imbricate on each side, Keel of the glumes ciliate

582 Leaves ovate-lanceolate sessile, Stem procumbent, Flowers axillary sessile

583 Leaves ovate-lanc nearly sessile acute with the creeping stem smooth, Involucr cordate doubled together
584 Flowers uneq. Involucres cord folded together at base with sheaths ciliated, Leaves lanc sess Stem decumb
585 Leaves lanceolate sessile with the decumbent stem smooth, Involucr cordate doubled together
586 Leaves ovate stalked obtuse, Involucres cordate hooded turbinate
587 Leaves ovate-lanceolate rough, Involucres hooded turbinate, Stem erect
588 Leaves lanceolate stalked rough above, Sheaths rusty, Stem erect simple
589 Leaves linear-lanceolate sessile rather hairy, Involucres ovate doubled together, Stem creeping
590 Villous, Leaves ovate stalked, Involucres half round folded in at the edge, Stem creeping
591 Leaves ovate-lanceolate sessile ciliated, Involucres cordate folded together, Stem erect
592 Involucres cord. acumin folded together, Pedunc pubesc. Pedicels smooth, Lvs obl lanc Sheaths ciliated

593 Smooth, Stem creeping, Leaves lanceolate, Flower-stalks 2-flowered
594 Stem solid woody with distant leafy knots, Leaves long ovate acuminate fascicled villous
595 Stem branched diffuse, Leaves ligulate acuminate, Racemes alternate about 7 placed in a panicle form, 3 Stamens bearded 3-naked

596 Leaves lanceolate, Flowers panicled

597 Stem branching, Branches and branchlets opposite, Flower-stalks many-flowered
598 Flower-bearing branches dichotomous, Flowers solitary

599 Leaves subulate prismatic, Spiny at the end
600 Leaves subulate scattered spreading distinct somewhat recurved, Cal nearly as long as capsules

1 *Vernal*

601 Mouth of flower closed by hairs, Segments obtuse, Stigmas dilated, Flowers large early
602 Segments of flower quite entire obt Anthers twice as long as the stigmas, Mouth of flower closed by hairs

and Miscellaneous Particulars

86. *Xyris* Ξυρος, acute Its leaf terminates in a sharp point Under this name a plant is described by Pliny, which resembles an iris Pretty little rush-like plants with yellow flowers, uncommon in collections, but easily cultivated, though rarely flowering.

87 *Callisia* From καλος, pretty; a name aptly given to this plant, which is easily known by its shining leaves edged with purple

88 *Commelina* So named by Plumier, in honor of the brothers, John and Gaspar Commelin, botanists and Dutch merchants Some of the species, such as C. coelestis and tuberosa, are very showy herbaceous plants, others are mere weeds They are all easily cultivated in wet places in the stove or greenhouse, and propagated by the rooting joints of their stem or by division of the roots, or by cuttings

89. *Aneilema.* From ανειλεω, to evolve, the flowers being evolved, as it were, from the spatha. A genus resembling Commelina, from which it is chiefly distinguished by not having its flowers enclosed in a spatha.

90. *Cartonema.* From καρηνον, shorn, and νημα, a filament, in reference to the stamens A plant resembling Commelina.

91. *Ortegia* In honor of Casimir Gomez de Ortega, a Spanish botanist, and professor of botany at Madrid. An insignificant herbaceous plant.

92. *Polycnemum* Πολυς, many, κνημη, knee, on account of the number of joints of the stem A decumbent annual plant of no beauty.

93. *Crocus* A name given by Theophrastus. The story of the youth Crocus being turned into this flower, may be read in Ovid's Metamorphoses This is an ornamental genus of great value in the flower-garden, on

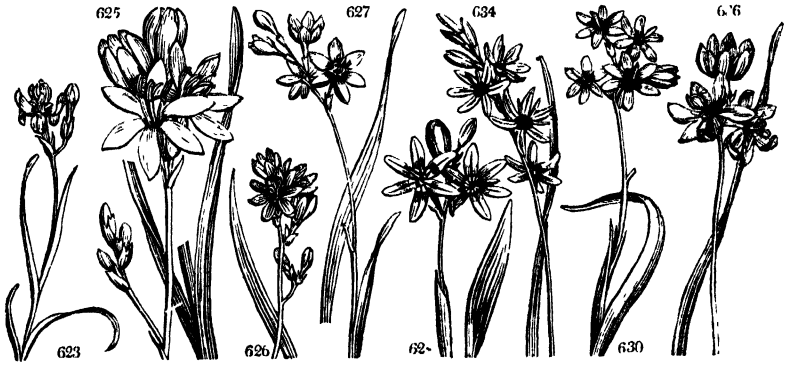
History, Use, Propagation, Culture,

account of the early season of flowering, and the brilliancy of the flowers Haworth, who has for thirty years paid particular attention to the Crocus, (*Hort Trans* 1 122) and raised many varieties from seed, found that the blue, purple, and white flowered kinds, ripened their seeds much more readily than the yellow, and that the leaves of the latter were narrower through all the species and varieties When this genus is in flower, the germen is situated underground almost close to the bulb, but some weeks after the decay of the flower, it emerges on a white peduncle, and ripens its seeds above ground This extraordinary mode of semination is peculiarly conspicuous in C nudiflorus, which flowers without leaves in autumn, and throws up its germen the following spring like the Colchicum Though some species of Crocus are, or appear to be, naturalized in a few places, yet they cannot be considered as aboriginal natives Allion affirms the C sativus (the saffron) is indigenous in Savoy, but Ray says nothing is certain as to its native country Professor Martyn considers Asia as its native country, saffron having there first acquired that high reputation in medicine, which it has now almost lost in Europe The Arabic name Z'afarán, and the Moorish and Spanish terms Azafran and Safra, seem to confirm this opinion C vernus, the *saffran printanier*, Fr, is a native of Switzerland and Italy, and is commonly found with white flowers and a purple base Some botanists consider it and C sativus as the only distinct species of the genus Miller describes four, Willdenow four, Sir J E Smith three, as natives of Britain, and Haworth (*Hort Trans* 1 132) no fewer than thirteen species Parkinson certainly cultivated many varieties which are not now known in collections Crocus vernus and versicolor, produce by cultivation varieties of singular beauty, both as to size, color, and marking C sativus, the saffron *Saffran*, Fr. and Ger, and *Zafrano*, Ital, is said to have been first brought into England in the time of Edward III, and introduced to Walden in Essex, to which town it afterwards gave the prænomen It was abundantly cultivated there, and in Cambridge, Suffolk, and Herefordshire, in the beginning of the 17th century; but the article is now so little in repute, or so much cheaper in foreign markets, that at present the culture of saffron is confined to a few parishes round Saffron Walden The bulbs are planted in July in a well pulverized soil, not poor nor a very stiff clay; they are placed in rows six inches apart across the ridges, and three inches bulb from bulb in the row The purple flowers are gathered in September and carried home, where their yellow stigmas and part of the style are picked out and dried on a kiln between layers of paper, and under the pressure of a thick

608 Segments of flower acute, Stigmas small, Flowers small late, Mouth of throat closed by hairs
604 Stigmas convolute hooded lobed as long as the anthers
605 Leaves longer than flowers, Stigmas but little longer than the anthers [membranous
606 Stigma inclosed trifid longer than stamens, Lobes filiform cucullate crisp, Lvs. setaceous, Tunic of the bulbs
607 The three outer segments of flower revolute
608 Stam as long as the truncate torn stigmas, Leaves supporting the flowers, Bulbs coated with net-work
609 Leaves longer than the flowers, Spathes 2 inner narrowest, Limb of cor funnel-shaped, Stigma length of
610 Stigmas unequal much longer than the anthers [anthers flattish jagged



611 Filaments hairy, Anthers longer than the stigma
612 Stigma enclosed trifid, Lobes somewhat linear toothed, Coat of the roots membranous
β Pale cream-coloured flowers
γ Pale cream-coloured flowers, with 3 sky-blue lines on the tube
613 Leaves upright-spreading their keel blunt sides nerveless, Flower in the sun campanulate stellate
2 *Autumnal*
614 Stigmas very long reflexed crenate at the end
615 Stigmas erect much divided, Leaves coming out with the flowers
616 Stigmas erect much divided, Leaves later than the flowers
617 Bulbs with a thready skin, Leaves later than the fl Stam as long as the truncate stigmas, Flower large

618 Flowers spiked, Outer segments of flower downy without
619 Flowers corymbose smooth

620 Leaves linear very narrow convex, Scape simple erect
621 Leaves with a cartilaginous edge, Racemes 1-7-flowered
622 Leaves ensiform, Tube of the flower turbinate [Anthers diverging
623 Leaves grassy, Spike 1-2-flowered, Flower hypocrateriform, Tube clavate straight, Filaments columnar,
624 Tube filiform, Limb bell-shaped spreading, Stigmas longer than the anthers
625 Leaves linear ensiform, Flowers 1-sided, Spathes toothed shorter than the tube
626 Tube slender a little enlarged, Limb below bell-shaped contracted, Segments spreading
627 Leaves slender, Raceme flexuose many-flowered
628 Limb spreading spotted at base, Stigmas not divided lower than the base of the anthers
629 Filaments united in a tube

630 Filaments united at base
631 Leaves lanceolate, Spathe toothed much shorter than the filiform tube, Segments lanceolate
632 Limb campanulate spreading spotted at base, Stigmas divided as low as the tube

633 Smooth with stalked bulbs, Leaves linear ensiform, Flowers in spiked heads, Tube shorter than segments
634 Leaves linear ensiform edged, Scape many-spiked many-flowered, Flowers spotted at base
635 Limb spreading not spotted, Stigm is divided as low as the tube
636 Limb hemispherical campanulate, Stigmas longer than anthers

and Miscellaneous Particulars

board to form the mass into cakes Two pounds of dried cake is the average crop of an acre after the first planting, and twenty-four pounds for the two next years After the third crop the roots are taken up, divided, and transplanted.

The uses of saffron in medicine, domestic economy, and the arts, were formerly very various It is now employed by painters and dyers, and enters into sauces, creams, biscuits, conserves, liqueurs, &c

As a garden-flower, the C vernus is the parent of many varieties, and these may be increased at pleasure by propagating from seeds Haworth directs to sow these immediately after being gathered in light earth, in a shady, but open situation Sift over them half an inch of earth the first autumn, and the second take them up and immediately replant them. Add another half inch of earth the third autumn, and the following spring most of the plants will show flowers in the midst of their fourth crop of leaves Afterwards they may be treated like old bulbs, and planted in the open borders or shrubbery, in patches, rows, or as fancy may direct The bulbs of crocus being renewed every year, and the new bulb formed on the top of the old one, it follows, that at whatever depth they may have been planted, they will in a short time rise to the surface, unlike the tulip and the bulbous iris, whose new bulbs being formed under the old ones, soon sink the plants, unless growing on a hard subsoil Crocus bulbs should be taken up every third year, after the leaves decay, dried in the shade, parted, and replanted three inches deep, and not later than michaelmas. The longer they are kept out of the ground after this period they become the weaker and flower the later In this way, and by preserving them in an icehouse, they may be retarded so as to flower at midsummer or later, and they may be accelerated by heat or blown in water-glasses, or on fancy pots called cats, hedgehogs, &c. common in the seed-shops The yellow-flowered species force better than the blue ones

94. *Witsenia* In honor of Mr Witsen, a Dutch consul in India, a patron of botanical science, and of Thunberg This genus and all the succeeding, as far as Pardanthus, consist of handsome herbaceous and bulbous plants, flowering for the most part in the spring, and not distinguished from each other by very distinct characters The bulbous sorts are easily cultivated in pots, are nearly all natives of the sandy wastes of the Cape of Good Hope, and are capable of succeeding well in a warm open border To make them flower well in pots, they should have no water while they are dormant.

History, Use, Propagation, Culture,

95. ***Ixia.*** Derived from *ἰξὸς*, to fix, in allusion to the viscid nature of the roots of some species.
96. ***Trichonema.*** From *θρὶξ*, hair, and *νημα*, a filament; the filaments being hairy.
97. ***Geissorhiza.*** From *γεισσοω*, to shape like the tiles or eaves of a house, and *ῥίζα*, a root.
98. ***Hesperantha*** From *ἑσπερα*, evening, and *ἀνθος*, a flower, in reference to the time the flowers expand

637 Tube twice as long as spathe, Segments oblong, Stigmas split gaping
638 Tube the length of the spathe, Segments spatulate concave, Stigmas funnel-shaped
639 Leaves curled

640 Leaves linear channelled
641 Leaves linear nerved thickened at the edge
642 Radical leaves with 4 furrows, Outer valve of spathe convolute rigid, Flower turbinate, Segments lanc
643 Leaves twisted, inflated at base, Flower very large spreading, Segm. with a black mark at the base, Stamens bearded at base, Anthers connate
644 Leaves linear, very long, Flowers veiny, spreading on long stalks, Edge of spathe membranous
645 Leaves filiform, Scapes 1-flowered, shorter than the campanulate flower

646 Leaves radical linear acute, Stem smooth, a little honey-pore at the base of the divisions of the flower
647 Leaves filiform, Stem few-flow smooth, spathes scarious much longer than tube, Segments of flower obl
648 Stem simple few-flowered, Radical leaves bristly
649 Radical leaves ensiform-linear obtuse
650 Radical leaves linear-acute, Stem villous
651 Radical leaves ovate oblong
652 A doubtful species, known only by name

653 Leaves fistulous
654 Leaves linear hairy, Stem smooth
655 Leaves linear with stem smooth
656 Radical leaves falcate smooth
657 Radical leaves falcate curled

658 Spathes spotted, Limb of flower regular

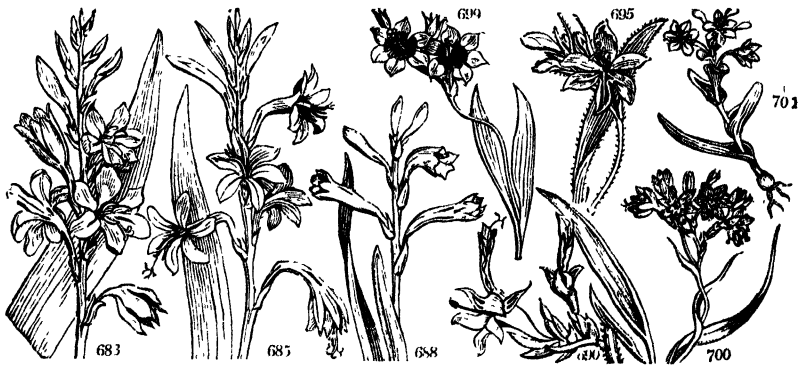
659 Spathes spotted, Limb of flower bilabiate
660 Spathes lined, Limb of flower regular segments ovate-oblong

661 Spathes lined, Limb of flower regular segments elliptical

662 Leaves waved curled, Segments of flower flat
663 Scape 3-cornered angles membranous
664 Outer valve of the spathe cuspidate, Tube of the flower very long, Upper segment largest
665 Spathe lanceolate pointed, Flower striped Upper segment erect largest, the rest linear oblong
666 Outer valve of the spathe obtuse 3-toothed, Tube very long, Segments of the limb equal
667 Leaves ensiform, Flowers in two rows, Spathes membranous shorter than tube, Segm of the limb linear

668 Upper segment of flower largest, outer retuse
669 Outer valve of spathe obtuse 3-toothed at end, Three lower segments of the limb with a stalked perpendicular callus at base
670 Outer valve of spathe cuspidate, Three lower segments of limb with a stalked perpendicular callus at base
671 Limb campanulate segments approximated, transparent at the edge towards the base
672 Limb infundibuliform, segments distant, transparent at the edge towards the base
673 Limb campanulate transparent at the base
674 Three outer segments gibbous within, at the base spotted and carinate
675 Leaves ensiform, Scape many spiked, Base of the flower lined not transparent
676 Spikes reflexed one-sided, Flowers infundibuliform, Spathes very short, Leaves linear ensiform

677 Leaves fistular slender
678 Upper leaves linear ensiform; lower fistular compressed
679 Leaves linear very narrow
680 Leaves linear ensiform, Anthers as long as throat, Corolla funnel-shaped with elliptical pointed segments



681 Leaves ensiform thickened at the edge, Spikelets several appressed, Flower funnel-shaped

and Miscellaneous Particulars

99. *Sparaxis* From σπαραξω, to tear The generic distinction consists in the lacerated spathas.
100 *Tritonia.* Named by Mr. Bellenden Ker, from Triton, understood, as he informs us, in the sense of a vane or weathercock, in allusion to the variable direction of the stamens in different species
101 *Watsonia* Named by Miller in honor of Dr Wm Watson, his friend. W brevifolia has its blossoms

History, Use, Propagation, Culture,

of a micacious hue, glittering in the sun, and not to be represented by art W iridifolia is a shewy border flower of a month's duration W mexicana is also very shewy, and has kidney-shaped bulbs

102 *Babiana* A name barbarously derived by Mr J B Ker from the name *babuner*, which the Dutch colonists at the Cape have given to the plant, because its roots are the favourite food of baboons. B ringens has dark-red bulbs

103. *Lapeyrousia* So named by Mr J B Ker, in honour of Lapeyrouse the celebrated and unfortunate French navigator

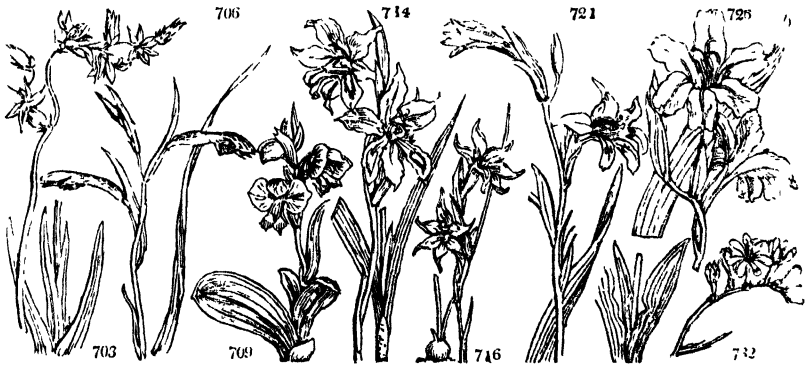
682 Stem upright many spiked, Leaves linear-lanceolate smooth edged with red
683 Leaves ensiform thickened at the edge, Spikelets several close together, Limb campanulate, Throat naked
684 Leaves ensiform very short, Limb spreading, inner segments widest
685 Flowers recurved, Tube the length of the spathe, Segments of limb acute

686 Flowers recurved, Tube longer than the spathe, Limb with obtuse segments
687 Flowers recurved, Tube the length of the spathe, Limb with acute segments
688 Flowers recurved, Throat nearly 4 times as long as the segments of the limb

689 Leaves villous, Flowers ringent
690 Leaves smooth, Flowers ringent
691 Tube filiform clavate three times as long as the irregular limb. Upper segment divaricating

692 Tube filiform twice as long as the regular limb, Segments obtuse alternate with a point
693 Segments longer than the throat marked with a darker linear longitudinal spot
694 Leaves stiffish subvillous plaited, Flowers distichous, Segments alternately curled
695 Segments length of the tube nearly equal, the alternate ones wavy the upper convolute at the end
696 Flowers funnel-shaped, regular, Segments scarcely longer than the tube, flat
697 Segments of flower thrice as long as the tube
698 Tube filiform the length of the regular campanulate limb alternate segments obtuse with a point
699 Limb much spreading, Segments rhomboidal spotted at the base

700 Flowers corymbose, Stamens much spreading
701 Flowers solitary



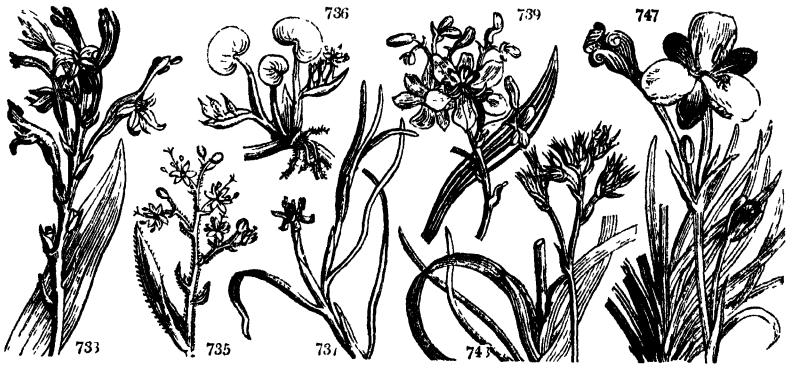
702 Tube very short, Segm nearly equal aristate, Scape paniculed, Leaves linear rather shorter than the scape
703 Many spiked, Scape weak, Spikes capil flexuose, Leaves sword-shaped smooth dist shorter than scape

704 Leaves linear ensiform, Upper segment of flower very long, lower very small
705 Leaves linear ensiform with 3 ribs on each side, Throat of the flower cylindrical, longer than segm of limb
706 Leaves 4-cornered 4-furrowed, Upper segment of flower very long, lower very small subulate
707 Upper segm of flower spat divar incurv lat rhomb-shaped ovate spread lower spat acute hanging down
708 Upper segm of fl obov recurved, lateral rhomb-shaped ovate spread lower spat acuminate hanging down
709 Upper segm of fl vaulted, lat rhomb-shaped ovate spread lower hanging down spat obtuse with a point
710 Sterile bulb with a single linear pubescent leaf, Flowering bulb leafless, Flowers subringent
711 Leaves linear-ensiform pubescent, Flowers nearly regular
712 Leaves linear-ensiform 3-ribbed on each side, Segments of flower longer than the throat

713 Leaves very long linear glaucous nerves prominent on both sides, Segments of flower cordate
714 Tube of the campan fl shorter than the spatha, Segments ovate obtuse the 3 lower with a hastate spot
715 Leaves 4-cornered 4-furrowed, Segments of flower nearly equal

716 Leaves 3 slender upright 4-cornered, Spike 2-3 fld 1-sided, Fl funnel-shaped nearly equal somewhat nodd.
717 Leaves linear the edge on each side ribbed, middle nerve nearly obsolete
718 Leaves linear with a rib on each side in the middle, Sheaths radical spotted
719 Tube linger than spathe, Up seg wider than rest, convol and recurv at end, lowest very narrow hang down
720 Tube twice as long as the segments of the limb which are acuminate wavy and reflexed
721 Tube shorter than the spatha, Limb campan subringent upper segm concave, the lower narr spotted
722 Leaves lanceolate smooth, Scape about 3-flowered longer than the leaves, Flower nearly campanulate
723 Leaves linear with a rib on each side in the middle, Tube longer than the spatha, the lower segments with a stalked 3-angular spot
724 Flowers ringent remote in two rows, Tube shorter than spatha, Segm lanc the lat rolled inwards at edge
725 Flowers erect funnel-shaped, Segments wavy, three lower nearly half as short as the others
726 Flowers erect turbinate campanulate, Segments equal in length, upper widest
727 Flowers erect campanulate, Segments equal in length upper narrower than in the lateral ones
728 Spikes several one-sided, three lower segments marked with a white lanceolate spot
729 Spike 2-rowed, Upper seg covered by lateral ones, the 3 lower marked by a white edged linear lanc spot
730 Spike 1-sided, Upper seg covered by lat ones, 3 lower marked by a white lin-lanc spot, lowest very large
731 Spike 1-sided, Upper segm. divaricating, 3 lower nearly equal, marked with a white edged lin lanc spot

732 Leaves broad lanceolate rather wavy



and Miscellaneous Particulars

104 *Melasphærula* From μελας, black, and σφαιρα, a globule In allusion to the colour and figure of the bulblets figured by Jacquin in his representation of the plant

105 *Gladiolus* From the Latin *gladius*, a sword, in allusion to the shape of the leaves G communis is a showy border flower, of which there are several varieties in general cultivation G cardinalis is a splendid plant, with scarlet flowers spotted with white

106 *Anomatheca* From two Greek words (ανευ and θηκη) signifying a singular capsule The capsule of the genus is remarkable for being, as it were, frosted

History, Use, Propagation, Culture,

107. ***Antholyza*** From ἀνθος, a flower, and λυσσα, rage A metaphorical name The flower has some resemblance to the mouth of an animal, which by the aid of a little imagination, may be supposed ready to bite

108. ***Xiphidium*** A name of a similar import with Gladiolus, being derived from ξιφος, a sword, in allusion to its stiff and sword-shaped leaves

109. ***Leptanthus*** Λεπτος, slender, and ανθος, a flower The tube of the flower is long and slender These are aquatic floating plants of little beauty

110. ***Wachendorfia.*** In memory of F. J. Wachendorf, a Dutchman, and professor of botany at Utrecht

111. ***Hæmodorum*** Αιμα, blood, and δωρον, a gift, that is to say, a plant which produces a red flower

733 Leaves ensiform nerved, Upper segment longest stretched forward, the others recurved.

734 Leaves smooth, Petals linear-lanceolate
735 Leaves hairy, Petals ovate

736 Leaves roundish reniform, Spathes oblong acuminate many-flowered
737 Leaves all linear

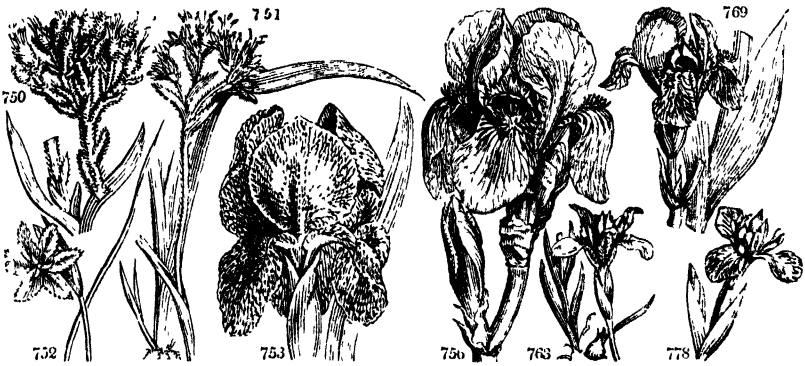
738 Scape nearly simple, Panicle contracted, Leaves ensiform 5-nerved perennial plaited smooth
739 Scape many spiked, Panicle spreading, Leaves sword-shaped 3-nerved annual plaited smooth
740 Scape many-spiked, Panicle spreading, Leaves sword-shaped channelled smooth
741 Scape many spiked, Panicle spreading, Leaves linear sword-shaped 3-nerved plaited villous
742 Leaves elliptic sword-shaped hairy

743 Corymbs compound, Branches spreading, Leaves flat

744 Flowers headed, Spathes many-parted torn
745 Heads of flowers alternate, Spathes entire
746 Flowers alternate, Segments of flower equal
747 Flowers alternate, three of the segments less than the rest
748 Scape about 1-flowered, Leaves linear-lanceolate a little falcate

749 Petals ovate oblong, Corymb level-topped hairy
750 Petals linear, Corymb level-topped villous viscid
751 Leaves ensiform, Scape villous above, Flowers spiked one-sided

752 Leaflets of the crown subulate

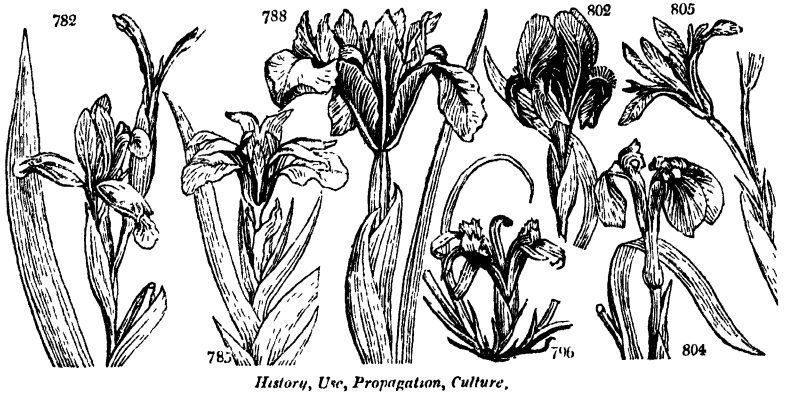


1 *Flowers bearded*

753 Stem 1-flowered longer than the leaves, Smaller petals deflexed
754 Stem 2-flowered longer than the leaves, Flowers sessile
755 Stem many-flowered longer than the leaves, lower flowers stalked, Spathes colored
756 Stem many-flowered longer than the leaves, Flowers sessile, Spathes white
757 Leaves lanc rather plaited, halt as short again as the branching stem, Spathes leafy, Tube length of germen
758 Stem about 2-flowered the length of the leaves, Germens 3-cornered
759 Stem many-flowered longer than the leaves, Petals emarginate the outer flat
760 Stem many-flow longer than the leaves, Outer petals revolute, inner nearly upright, wavy and inflexed
761 Stem many-flowered longer than the leaves, Deflexed petals folded back upright emarginate
762 Stem many-flowered as long as the leaves, Deflexed petals emarginate, erect oblong
763 Stem many-flowered longer than the leaves, Erect petals entire, deflexed rather emarginate
764 Leaves shorter than the 3-flowered stem, Larger petals undulate reflexed, smaller emarginate

765 Scape round about 3-flowered longer than the leaves, Deflexed petals narrower than the erect ones
766 Scape about 1-fl scarcely shorter than ensiform leaves, Tube of corolla about equal to the 6-streaked germen
767 Stem compressed about 1-fl the length of leaves, Petals about equal, Beard crested, Germens 3-cornered
768 Scape compressed many-flowered, Stigmas jagged
769 Scape 2-flowered shorter than the ensiform leaves, Upper flower abortive
770 Scape very short about 1-flowered, Spathe erect the length of the tube
771 Scape 2-flowered longer than the leaves, Spathes the length of the tube
772 Scape very short 1-flowered, Spathes shorter than the tube, Reflexed petals narrower than the erect ones
773 Nearly stemless, Scape panicled round, Branches 2-4-flowered
774 Leaves ensiform smooth somewhat falcate nearly equal to the many-flowered scape, Spathes inflated
775 Leaves ensiform falcate smooth, Scape 1-flowered, Petals obovate

2 *Flowers beardless*



776 Leaves flat, Inner petals less than the stigma
777 Stem one-angled many-flowered longer than the leaves
778 Stem round flexuose equal to the leaves, Germens nearly 3-cornered

and Miscellaneous Particulars

112 *Aristea* From *arista*, a point or beard The leaves are bearded.
113 *Dilatris* A name not satisfactorily explained
114 *Brodiæa* Named in honor of Mr Brodie, of Brodie House, a Scotch gentleman, who paid great attention to the botany, especially Cryptogamia, of his own country
115 *Iris* The name given by Theophrastus, Dioscorides, and Pliny, from the variety of its colors According to Plutarch, the word iris signified, in the ancient Egyptian tongue, *eye* the eye of heaven This beautiful genus abounds in Europe, but is rare in America. Some are bulbous, but the greater part tuberous rooted, of easy culture, and propagation by seed or division of the root The roots of I florentina, ger-

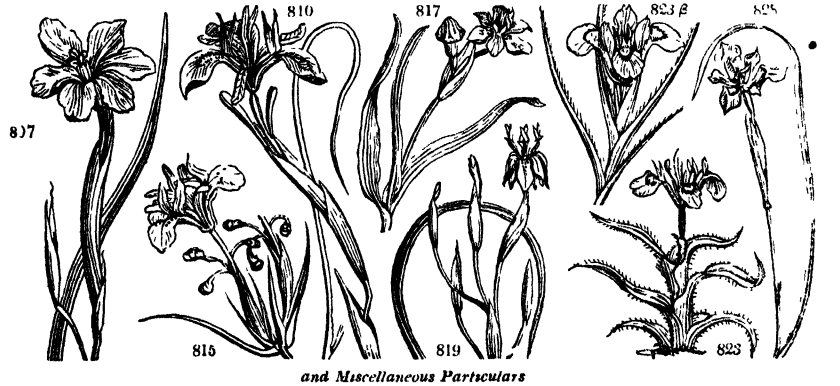
History, Use, Propagation, Culture.



manica, and pseud-acorus are used in medicine, those of the first are remarkable for communicating an odor like that of violets, and are the orrice-root (iris root of the shops The root of I pseud-acorus, in powder, used as snuff, produces a great heat in the mouth and nose, and occasions discharge from the nostrils it is astringent, and used instead of galls in making ink or dying black The fresh juice of the root is one of the most powerful cathartics, and in that way has cured inveterate dropsies I germanica possesses similar qualities, and the root of either species suspended in wine or beer, keeps the latter from growing stale, and communicates a pleasant taste and smell to the former The leaves and roots of I fœtidissima are steeped in beer by the country people in some places as a purge I susiana flowers well in a warm border and loamy soil I fimbriata is rather tender, it requires a rich light soil, and to make it flower freely, it must be planted in a large pot, and have the suckers removed from the roots as soon as they appear I orientalis requires a similar treatment, and with the two preceding species requires the protection of a green-house to make it flower in perfection. Of I xiphioides there are numerous varieties procured from seeds, which are treated much in the same way as those of crocus This species, and I tuberosa are very ornamental, they thrive best in a light

779 Stem round flexuose as long as leaves, Petals all emarginate obovate, the inner shortest, Capsules very large
780 Stem 2-edged many-flowered longer than the leaves
781 Leaves linear, Scape round, Germens 6-cornered, Stigmas acute, Petals rounded
782 Leaves linear, Scape about 3-flowered round, Germens hexagonal, Petals ovate longer than their claw

783 Leaves ensiform, Scape nearly round, Germens hexagonal, Petals erect oblong
784 Radical leaves very long, Stem higher than the leaves, Germens hexagonal
785 Stemless, leaves channelled, Three erect petals very small, Tube very long
786 Leaves channelled subulate, Stem 2-flowered, Petals nearly as narrow as stigmas, Germen round
787 Leaves channelled subulate, Stem 2-flowered, Petals much wider than stigmas, Germen acutely angular
788 Leaves channelled, Scape 2-flowered, Inner petals emarginate
789 Stemless, Leaves filiform very long, Scape very short 2-flowered, Tube of the corolla filiform
790 Leaves linear subul. channelled longer than the very short 1-flow scape, Inner petals very short spreading
791 Leaves flat, Scape 1-flowered shorter than the leaves, Petals nearly equal
792 A little caulescent, Stem about 2-flowered shorter than the leaves, Spathes ventricose, Germens 3-angular
793 Stem about 3-flowered fistulous longer than the leaves, Germens 3-angular
794 Stem solid round as long as the leaves, Leaves very narrow long, Capsules long pointed at each end
795 Stem about 2-flowered 2-edged shorter than the leaves, Germens hexangular
796 Leaves linear-ensiform very much longer than the 2-flowered very short scape, Petals acuminate
797 Leaves linear longer than the 1-flowered scape, Alternate petals smaller
798 Leaves 4-cornered
799 Scape 1-flowered shorter than the 4-cornered leaves, Tube filiform, Root bulbous
800 Outer petals spatulate, Stem branched at the base shorter than the leaves
801 Leaves lanceolate falcate edged, Stem about 2-flowered
802 Leaves ensiform shorter than the 3-flowered 2-forked scape, Germen 3-angular 3-cornered
803 Leaves linear acute length of the 3-fl scape, Spathes withered with a long point, Flowers close together
804 Leaves linear-lanceolate very long, Inner petals very short, Stigmas spirally revolute
805 Leaves ensiform doubled together striated incurved at end, Ovaries very long cylindrical, Stigmas keeled serrated at end

806 Segments of the flower nearly equal oblong spreading, Filaments united at base
807 Segments nearly equal obovate very spreading, Filaments united in a cylinder

808 Segments spotted and dotted at base, The three inner half as short as the others and much narrower erect
809 Inner segments linear, sometimes absent
810 Leaf filiform erect with 1-flowered scape smooth, Spathes obtuse
811 Outer segments very spreading bearded, Inner small 3-toothed at the end the middle tooth the longest
812 Outer segm deflexed bearded, Inner very small 3-toothed at end the middle tooth longest and involute
813 Outer segments beardless, Inner very small 3-toothed at the end
814 Lower leaf longest of all, All the segments of the flower very spreading the alternate ones small
815 Tube filiform very long All the segments reflexed
816 Beardless, Flower uniform nearly equal, Stigmas petal shaped
817 Leaves very smooth, Stem branches and peduncles villous
818 Leaves about the length of the scape, All the segments of the flower spreading, the alternate ones smaller
819 Lower leaf spirally twisted, Stem smooth, Branches viscid
820 Leaves straightish, Stem and branches viscid
821 Stem panicled much branching, Segments nearly equal deflexed
822 Bearded, Leaves on the inside villous in lines, Stem pubescent, Invol. very smooth, Alternate segments of flower very small 3-toothed
823 Leaves ciliated, Inner segments erect
824 Tube filiform very long, Segments alternate erect
825 Leaves pubescent, all the segments spreading
826 Leaves slender dependent, Flowers terminal in close heads
827 Leaves perennial equitant, Segments of flower spreading alternate ones much the largest
828 One-flowered a little bearded, Leaves about 3 linear, Stem simple, Outer segments of flowers rounded: inner very narrow entire
829 Scape winged sword-shaped, Common spathe 2-leaved, partial 2-flowered, Flower stalks simple

and Miscellaneous Particulars

sandy soil and eastern exposure; the bulbs are taken up every other year, but must not be kept longer out of ground than a month I persica is highly odoriferous, it is propagated by separating the bulbs, or from seeds, but by the latter mode no new varieties have hitherto been obtained I susiana and persica bear forcing well supplies of them, and of I xiphioides are annually imported from Holland In a deep and loose soil the roots of the tuberous and bulbous species of this genus are apt to run down when they cease to flower, and getting gradually weaker and weaker, are at last lost. To prevent this, Miller advises to form a stratum of rubbish about a foot and a half under the surface

116. *Morœa* So named by Miller, in honor of Robert Moore, of Shrewsbury, a distinguished botanist, of whom there exists a memoir in the Philosophical Transactions M pavonia is one of the most elegant species of the genus. The bulbs of M edulis are eaten at the Cape of Good Hope, both by men and monkeys, and those of M. sisyrinchium are eaten in Spain Sweet recommends, as the best soil for these plants, "a mixture of sandy loam."

117. *Marica.* A name perhaps obtained from μαραινω, to become flaccid, in allusion to the nature of the

History, Use, Propagation, Culture,

flowers M northiana has beautiful and transient flowers, like the rest of the species, all of which grow freely in a rich light soil, and are readily increased by parting the roots or from seeds

118 *Pardanthus* Named by Mr J.B Ker, from παρδος, a leopard, and ανθος, a flower, on account of the spotted flower

119 *Schœnus* From χοινος or σχοινος, a cord, in Greek From plants of this kind the first cordage is supposed to have been made All the plants from this genus to Mariscus, No 130, are sedgy plants of similar habit, of value in an œconomical point of view, but not cultivated for ornamental purposes

120 *Rhynchospora*, (ῥυγχος, a snout or rostrum, and σπορα, a seed) The seeds are beaked

121 *Fimbristylis.* So named by Vahl The word is constructed from the Latin *fimbria*, a fringe, and *stylus*, the style.

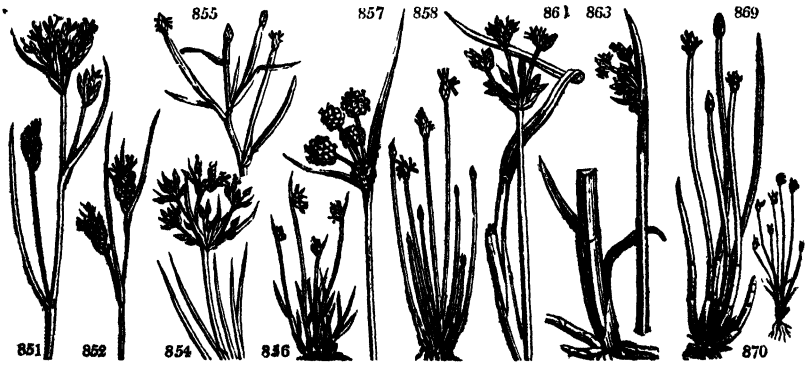
122. *Isolepis* From ισος, equal, and λεπις, a scale, on account of the relative form of the scales which constitute the inflorescence.

830 Beardless, leaves linear, Petals with glandular spots, Ovaries 3-cornered
831 Flower-stalks lateral nearly equal to the one-leaved involucrum
832 Leaves linear-lanceolate, Scape round shorter than the plaited leaves
833 Leaves linear-ensate flat, Scape simple leaf-like winged, Flowers opened out, Fil. united at base
834 Scape 2-edged, Flowers in spikes, Leaves sword-shaped nerved-plaited

835 Scape 2-edged leafy, Flowers in spikes, Petals roundish ovate acute, Leaves linear sword-shaped
836 Scape 2-edged simple nearly leafless, Spathe about 4-flowered unequal longer than the flowers, Pet muc.
837 Scape 2-edged branchy leafy, Spathe about 3-flow unequal, Pet linear acuminate, Leaves grassy channelled
838 Scape 2-edged branched leafy, Spathe about 4-flow shorter than the flowers, Pet. muc. Leaves sword-shaped
839 Scape 2-edged branched leafy, Spathe 3-flowered shorter that the flower, Leaves sword-shaped
840 Scape 2-edged ascending leafy, Spathe 3-flowered, Caps. hairy, Leaves capillary
841 Stigmas united petal shaped, Scape many-flowered erect, Spathe not viviparous
842 Leaves linear-lanc. nerved a little wavy at back, Fl.-stalks nearly as long as spathe, Flowers campanul.

843 Flowers spotted with orange

844 Culm round naked, Spikelets bundled in a roundish head, Involucr 3, 6-leaved very long reflexed
845 Culm naked round, Spikelets in headed bundles, Invol. 2-leaved longer than the valves, Setæ none
846 Culm round leafy, Leaves channelled, Spike compound 2-ranked longer than the bractea
847 Culm round naked, Spike compound, Flower monœcious, Leaves channelled rough
848 Culm round, Spikelets 2-3, Outer valve of involucrum as long as spikelets, Setæ several
849 Spike distichous, Spikelets many-flowered, Involucre 1-leaved, Culm roundish
850 Involucres very long white. (Dichromena, *Vahl.*)



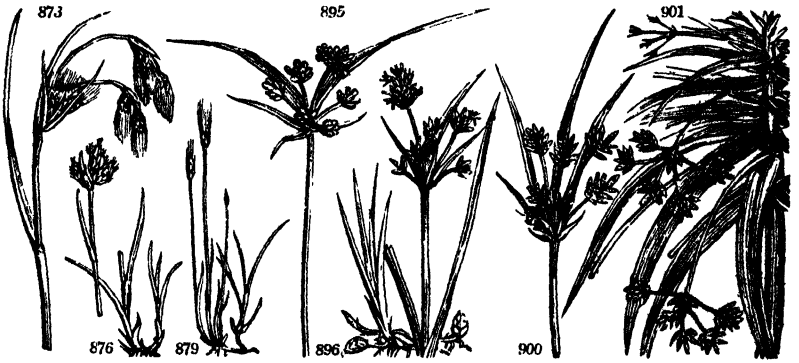
851 Culm leafy 3-angular, Leaves linear keeled, Root creeping
852 Culm 3-angular, Leaves bristly channelled, Root creeping
853 Leaves flat glaucous with hairy sheaths, Invol. longer than the contracted panicle, Spikelets oblong, Scales oblong carinate mucronate

854 Spikes ovate oblong, Involucre about 3-leaved decompound longer than the umbel

855 Culms branched leafy flaccid, Spikelets few-flowered, Floating
856 Culm bristle-shaped, Spikelets lateral sessile
857 Culm round naked, Heads terminal globose clustered, Leaves channelled

858 Stem round sheathing at the base, Spike ovate terminal, Glumes obtuse equal, Root fibrous
859 Stigmas 3, Spike enclosed in a 2-leaved involucrum, Lower glumes very large as big as the spike, Culm round, Sheaths bearded
860 Glumes unequal obt ovate, one larger but shorter than the 2-valved spike, Culm round, Sheaths not bearded
861 Culm round, Inner sheaths ending in a short leaf, Cyme terminal decompound with 2-4-leaved involucrum Spikelets ovate smooth
862 Top of the 3-angular stem straight, Upper sheaths leafy, Panic lateral under the end, Spikel sess. & stalked
863 Culm straight naked pointed, Lateral spikes sessile or stalked, Stigma bifid
864 Top of the 3-cornered culm bent down at end, Sheaths leafless, Spikel. lateral sess. clustered naked, Stigmas 3
865 Culm naked, upwards 3-cornered, Panicle cymose terminal, Bract. pungent, Stigma bifid
866 Panicle globose terminal, Glumes mucronate torn bifid
867 Spikes roundish headed, Heads umbelled globose proliferous, Invol many-leaved, Culm 3-angular
868 Culm 3-cornered leafy, Cyme term. supra-decompound surrounded with a many-leaved invol. Gl mucronate

869 Spike ovel naked, Scales lanceol acute, Culms roundish, Sheaths leafless beardless lanceol. acute, Stigmas 2
870 Spike ovate naked, Two lower scales scarcely larger than the rest, Culms 4-cornered setaceous
871 Spike ovate naked, Scales oblong obtuse, Stigmas 2, Culms sub-compressed, Sheaths leafless, Root fibrous



and Miscellaneous Particulars.

123. *Scirpus.* From *cirs*, a Celtic word for rushes, which is, in the singular, *cors*, whence the Latin *chorda*. S. cæspitosus is the principal food of cattle and sheep in the Highlands of Scotland in March and till the end of May. S. lacustris, the bull-rush, is used to bottom chairs. cut at one year old, it makes the finest bottoms, at two years, a coarser sort; still older, and mixed with the leaves of Iris pseud.-acorus, it makes the coarsest bottoms. Cottages are sometimes thatched, and pack-saddles stuffed with it, and in severe seasons cattle will eat it. Of S. maritimus there are several varieties, natives of the salt marshes of Europe, Barbary, and Siberia, greedily eaten by cattle; and the roots, which are large, Withering says, have been ground and used instead of flour in times of scarcity. The Pi-tsi or water-chestnut of the Chinese, is a species of this genus (Scirpus tuberosus). It has not yet been introduced to our gardens. In China it is cultivated in tanks, the bottoms of which are manured and exposed for a time to dry in the sun. The tubers are eaten either boiled or raw, and are esteemed both as food and medicine.

124. *Eleocharis.* From *Elos*, a march, and *charro*, to delight.

History, Use, Propagation, Culture,

125 *Eriophorum.* From ἔριον, wool, and φέρω, to bear Its seeds are covered with silky tufts of a wool-like substance. For the same reason it is called in English cotton-grass.

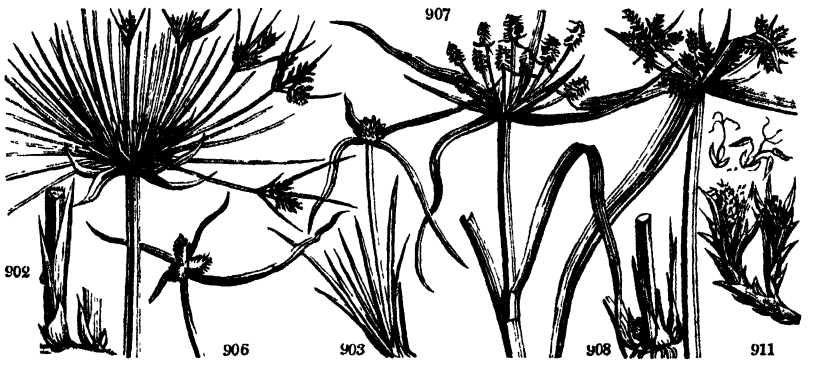
126 *Trichophorum* From θριξ τριχος, hair, and φέρω, to bear Its inflorescence resembles a bunch of hair. This genus and Eriophorum grow in peat bogs, and have their seeds clothed at the base with a white or brown silky down or cotton-like substance, from which specimens of cloth have been made, paper, and wicks for candles; and in Sweden, pillows stuffed Of these genera, and of the Cyperaceæ in general, it has been observed by Villars, that being mostly natives of bogs, marshes, and watery places, they have a tendency to raise and dry such spots. The roots and base of the stems rot and become peat, and thus are useful as firing or manure.

127. *Cyperus* The roots of some species of this genus have eatable roots, and are considered aphrodisiacal in a high degree. It is, therefore, probable that the word derived its origin from Cypris, a name of Venus. This is a genus of sub-aquatic or marsh sedgy plants, more injurious than useful, and of little or no beauty. The root of C. longus is agreeably aromatic, warm, and bitter: those of C esculentus (*souchet comestible*, Fr) produce round tubercles about the size of peas, which are eaten in some places in France and Spain; and when boiled, taste something like chestnuts.

128. *Papyrus.* A word of obscure origin P. antiquorum yields the substance used as paper by the ancient Egyptians In Syria it is called *babeer*, and hence, probably, the words papyrus and paper. The flower-stalk rises about ten feet from a long horizontal thick root, the lower part clothed with long hollow sword-shaped leaves

872 Spike solitary, Culm very smooth, Sheaths inflated
873 Spikes several, Culms 3-cornered, Leaves broadish keeled
874 Spikes several, Culms 3-cornered, Leaves very narrow setaceous
875 Spikes several, Culms round leafy, Spikes sessile clustered shorter than the involucrum
876 Spikes several, Culms 3-cornered, Leaves nearly filiform 3-cornered, Peduncles rough, Flowers erect
877 Spike solitary, Culms round spongy soft, Sheaths not inflated

878 Umbel compound, Culm branched
879 Spike solitary, Culms simple 3-cornered roughish



880 Head globose, Spikelets oblong convex about 8-flowered, Involucr 4-leaved, Leaves channelled lax
881 Spikelets solitary and in pairs sessile, Involucr. 1-leaved, Culm setaceous
882 Spikelets ovate much clustered, Culm rather 3-cornered, Leaves channelled
883 Stem 3-cornered leafless ascending or decumbent, Spikelets about 5 oblong obtuse very shortly stalked
884 Heads simple and clustered ovate, Spikelets oblong, Involucr. very long
885 Spikes distichous, Spikelets spreading filiform, Florets distant, Umbel upright
886 Spikelets aggregate ovate rather squarrose in heads, Involucr longer than umbel, Lvs. and involucr rough
887 Umbels many rayed compound, Spikes elongate, Spikelets linear-lanceolate, Involucr 4-leaved long
888 Lvs. linear shorter than the 3-cornered culm, Involucr. 3-leaved, outer leaf very long, Spikel. lanc. Scales obtuse
889 Spikelets linear-lanceolate, Umbels corymbose fascicled, Involucr about 6-leaved
890 Culm 3-cornered naked, Umbel 3-leaved supra-decompound, Spikes clustered rounded, Spikelets subulate
891 Spikelets about 3 linear, Valves obcordate mucronate distinct spreading, Umbel loose
892 Spikelets linear-lanc alternate clustered, Glumes obtuse, Involucr 3-leaved longer than the trifid umbel
893 Spikelets linear-lanc alternate very close, Valves acute, Involucr about 3 or 5-leaved very long, Umbel 3-5-fid.
894 Spikes oblong loose, Spikelets subulate alternate capitate, Involucr very long spreading, Rays of umbel altern.
895 Spikelets lanceolate roundish headed compact, Valves ovate 1-nerved, Involucr longer than the umbel
896 Spikelets lin.-lanc distant acute, Rays of the umbel about 7 terminal shorter than the 3-5-leaved involucrum
897 Spikes corymb Spikel. lin.-lanc. flattened, Involucr. and rays of umbel very long corymbose with leafy stem
898 Spikes corymbose, Spikelets linear, Valves remote obtuse obovate spreading in fruit, Umbels loose
899 Spikes nearly sessile imbricated round, Spikelets ovate oblong spreading
900 Spikelets in corymbose fascicles, Spikelets linear-lanceolate dense, Involucr. 3-leaved, Leaves very rough
901 Umb. 6-7-rayed compound, Heads many-spiked, Spikel. lin. many-flowered, Involucr 3-leaved reflexed rough

902 Stem tall terminated by a reflexed involucrum of many very long narrow leaves

903 Head globose sessile solitary, Involucr very long
904 Umbel rather contracted, Involucr. very long, Spikelets clustered, Valves ovate carinate acute
905 Head 1 or 3 sessile round, Involucr many leaved long, Valves carinate hooked
906 Heads about 3 sessile clustered, Spikelets very dense rather imbricated

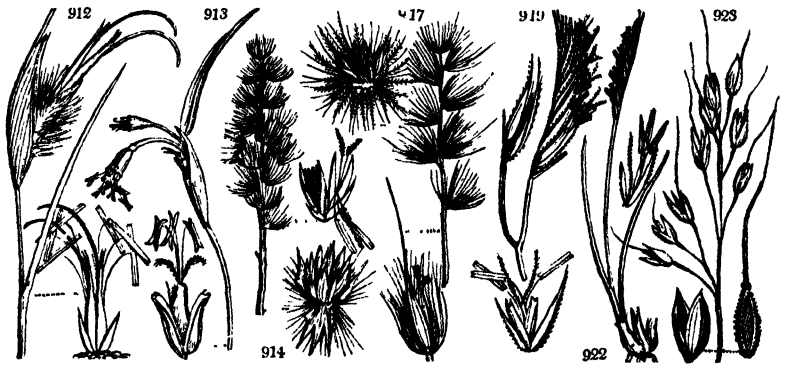
907 Umbel compound, Spikes cylindrical imbricated backwards, Involucres many-leaved
908 Umbel compound, Spike cylindrical, Spikelets very spreading, Bractes longer than the spikelets
909 Leaves shorter than the 3-cornered culm rough at edge, Umb contracted, Involucr many-leaved, Spikel subreflexed, Scales keeled striated
910 Spikes cylindrical sessile, Spikelets oblong, Bract setaceous longer than spikelets, Involucr. many-leaved

911 Common peduncle shorter than the spikes

and Miscellaneous Particulars

of a brown color. The ancients made their paper from the pellicle found between the flesh and bark of the thick part of the stalk, ribbons of which were united till they formed the size required, and then pressed and dried in the sun. The top of the stalk, with the umbel of flowers, adorned the temples, and crowned the statues of the gods. Antigonus used the stalks for ropes and cables to his fleets, before the use of spartum (*Lygeum spartum*, still used on the coast of Provence for small vessels, and also in Spain) was known. Pliny says, the whole plant was used for making boats, and Bruce says, they have no other boat in Abyssinia. That traveller found it growing in the rapid course of the river Jordan, and he there remarked that it constantly opposed one of the angles of its stem to the current, as if to elude the violence of the waves. Perhaps, if the observation were applied to similar plants in our own rivers, the same result would be obtained. The root was chewed for its juice, which is also practised in Abyssinia with various species of cyperus, and with those of maize. The papyrus is indigenous in Calabria as well as in Ethiopia and Egypt, in stagnant water, but only in the calashes or swamps of the Nile, and never in the stream as has been supposed. To thrive in our stoves, it requires to be placed in a cistern of water with rich mud at the bottom. Plants so treated, at White Knights, near Reading, have attained a large size, and flower freely.

129. *Kyllinga.* In memory of P. Kylling, a Danish botanist, who died in 1696.



130. *Mariscus.* A word derived from the Celtic *mar*, a marsh, in allusion to the situations in which it is found.

131. *Remirea.* The Guiana name of the plant.

History, Use, Propagation, Culture,

132 *Lygeum.* From λυγοω, to bend, in allusion to its flexibility This plant is used in Spain, Provence, and other places for making ropes, baskets, nets, and for filling their paillasses or lower mattrasses. Ropes were made of it by the Romans *Esparto* (spartum) is the Spanish appellation of this and other grasses used for similar purposes.

133. *Cornucopiæ* The spike inclosed in the involucrum peculiar to the genus, resembles the "Horn of Plenty." The leaves and flower of C cucullatum, Sir J. E Smith observes, are perhaps of all grasses the most singular and uncommon It is a native of the vales about Smyrna, whence it was sent to England by Sherard, and is preserved in the Chelsea garden and at Kew

134. *Cenchrus* Κεγχρος is the Greek name of the millet; by which, it is probable, that Setaria italica was intended. C. echinatus is the most common grass in the pastures of Jamaica, and is looked on as a wholesome and pleasant food for horses and cattle

135. *Pennisetum.* From *penna*, a pen, and *seta*, a bristle; a feathery bristle, referring to the nature of the involucrum.

136. *Spartina.* A word altered from spartum, the specific appellation of Lygeum; the plants being similar to the latter in habit The origin of the word spartum has not been satisfactorily explained. The Spaniards call this, and similar tough grasses, useful to them in making ropes, esparto

137. *Nardus* The term νεῖρος was applied by the Greeks to a substance possessing a peculiar per-

912 The only species

913 The only species

914 Branches of the panicle simple, Palæ hispid backwards, Glumes 3-valved 2-flowered (*Centotheca.* Desv.)
915 Spikelets approximated, Involucres 10-parted villous
916 Spike with alternate spikelets, Involucres entire spiny

917 Culm jointed, Invol. altern. twice as long as flowers, one of the setæ bristle-chaffy longer than the others

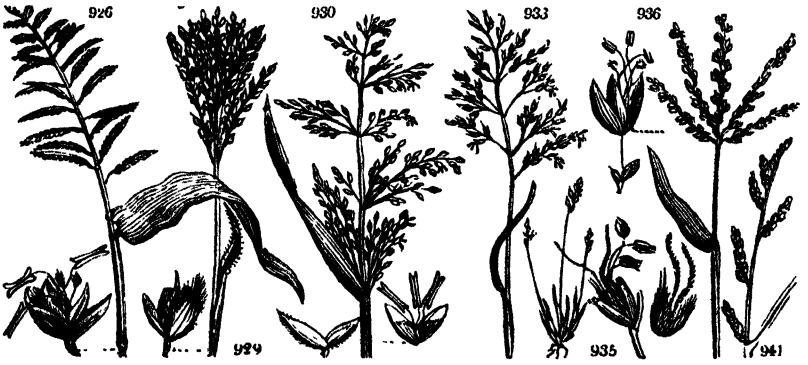
918 Spikes term. about 2, Spikelets one-sided loosely imbricated Palæ longer than glume, Leaves involute
919 Spikes altern. remote, Rachis ang. wavy, Glumes twice as long as palæ, Leaves very long glaucous flat
920 Leaves broad flat, Spikes many turned all ways linear, Keels aculeate
921 Leaves distichous shortish bristly convol. Spikes few remote spreading, Glumes acuminate, Keels rough

922 Spike bristly straight one-sided

923 The only species

DIGYNIA.

924 Spikes few altern. Rachis flat straight as long as spikel Glumes roundish obtuse smooth, Upper lvs naked
925 Spikes very num. Rachis 3-sided smooth twice as narr as spikel Glumes roundish obv blunt pub 3-nerv
926 Spikes numerous scattered, Rachis undulated broader than spikelets, Glumes oblong corrugated, Leaves lanceolate rough at edge
927 Spikes 2 close together, Rachis flat narrower than spikelets, Glumes ovate obtuse polished length of palæ
928 Spikes 5 close together, Rachis flat rather broader than spikelets, Glumes elliptic lanc acute pubescent



929 Panicles umbelled, Racemes about 4, One glume fringed

930 Panicles diffuse, Florets beardless ovate dispersed
931 Pan spreading lax few-flowered, Flowers bearded, Each glume at least 3-nerved (*Piptatherum.* P de B.)
932 Panicles spreading many-flowered, Flowers bearded, Outer glume 3-5-nerved
933 Flowers panicled bearded, Beard shorter than glume
934 Stem shrubby at base, Panicle whorled, Lower rays sterile

935 The only species. The least of grasses

936 Spikes digitate erect spreading 4, Leaves and sheaths pilose, Florets oblong pubescent at edge
937 Spikes many setaceous, Leaves and sheaths very hairy
938 Spikes digitate erect 7, Leaves and sheaths hairy, Florets oblong acute smooth
939 Spikes digitate erect spreading 8, Leaves and sheaths hairy, Florets lanceolate ciliated
940 Stem decumbent, Sheaths hairy at end, Spikes divaricate, Palæ fringed at end

941 Spikes alternate one-sided beardless ovate rough, Rachis roundish
942 Spikes alternate sessile one-sided, Glumes two much shorter than palæ retuse, The third as long as they
943 Spikes panicled alternate erect in bunches, Spikelets one-sided roundish
944 Very smooth, Panicles oblong erect, Glumes striated largish, Stem branching

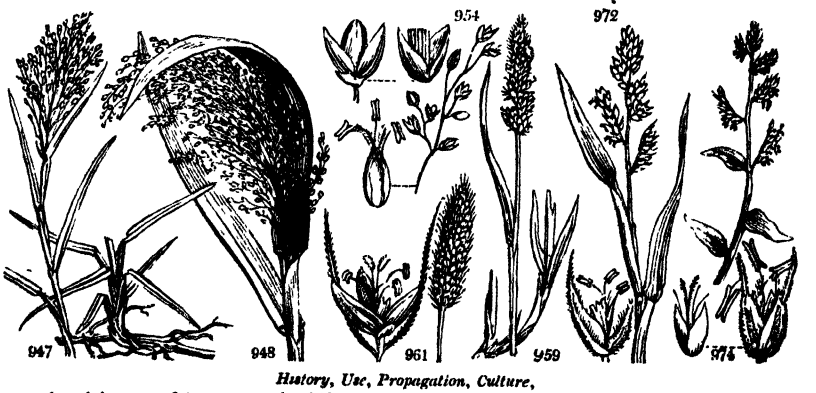
and Miscellaneous Particulars.

lume. It is difficult to assign a reason for the name having been applied to this insignificant genus of grasses.

138 *Oryzopsis* Oryza, rice, and ὄψις, appearance. The plant resembles rice.

139. *Paspalum* One of the Greek names for millet, πασπαλος.

140. *Axonopus.* From ἄξων, axis, and πους, a foot, because the chief difference between this genus and Paspalum consists in the spikes being separately placed, as it were, upon little stalks or feet.



141 *Milium.* Derived by some from *mille*, a thousand, on account of its numerous grains; by others, from *mil*, the Celtic for a pebble, in reference to the hard shining nature of the grains. M. effusum is admired for the elegance of its panicle. M. paradoxum resembles the Arundo.

142. *Knappia.* Named after Mr. Knapp, an author of an illustrated work upon British grasses, &c much esteemed. A minute plant, resembling an agrostis

143. *Digitaria.* From *digitus*, a finger, on account of the singular manner in which the heads are divided, or, as the botanists express it, fingered. D. sanguinalis has its specific name, not from the color as might be supposed, but from an idle trick which the boys in some parts of Germany have of pricking one another's nostrils with its spikelets till they bleed. It abounds by the road sides in Poland and Lithuania, where its seeds are collected and boiled whole like rice, with milk, and highly esteemed

144. *Panicum.* Pliny says, so called, from its flowers being in a panicle; but others derive the name from

History, Use, Propagation, Culture,

panus, bread, because of its uses as such. Of P. miliaceum there are two varieties, the brown and yellow. They are sometimes sown in this country for feeding poultry, and for having the husk taken off, to be used as rice; but the ample supplies received from the shores of the Mediterranean, render the culture of the plant unnecessary P. arborescens, is said, by Linnæus, to contend for height with the loftiest trees in the East Indies, though the culm is scarcely thicker than a goose quill. This culm resembles that of Commelina, and shoots up through the branches of trees in woods and jungles.

145. *Setaria.* From *seta*, a bristle, on account of the bristles of the involucrum. S. italica is frequently called millet, and its seeds are used for the same purposes. S. germanica is cultivated in Hungary as food for horses, for which it is preferred before all other grasses. The seeds may be used as millet. Sparrows are remarkably fond of the seeds of S. viridis; and, according to Curtis, this and the two preceding genera, when cultivated in gardens, require to be protected from them from the time they come into flower.

146. *Echinochloa.* From ἐχῖνος, a hedge-hog, and χλόη, a grass, on account of the prickly appearance of the heads of flowers. E. crus-galli is a coarse grass which grows thick and close, and stands dry weather better than most others.

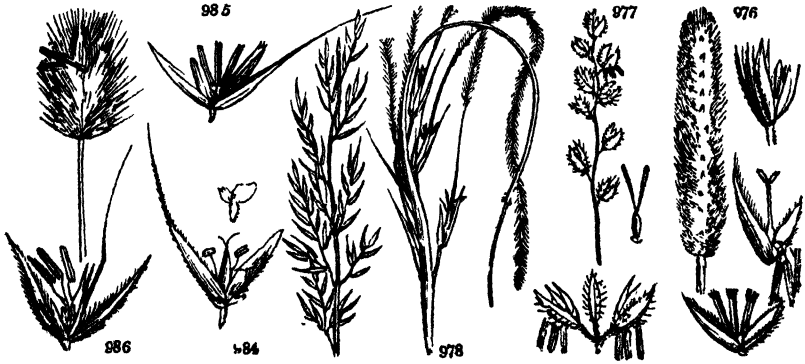
945 Spikes 2-3 together erect, Glumes hispid with two beards
946 Panicles spreading, Stamens and pistils coloured, Stem branching
947 Panicles twiggy, Leaves divaricating
948 Panicles lax nodding, Spikelets beardless, Leaves lanceolate pilose, Sheaths hirsute, Valves mucronate
949 Panicles spreading, Flowers solitary muricated, Stem rooting ascending
950 Panicles capillary erect spreading, Pedunc. straight, Glumes acuminate smooth, Sheaths very hairy
951 Panicles with simple lateral racemes, Leaves ovate lanceolate hairy at the neck.
952 Panicles few axillary, Stem dichotomous, Sheaths dotted
953 Panicle much branched, Leaves ovate oblong acuminate, Shrubby
954 Panicles branched diffuse, Glumes acuminate smooth gaping, Leaves reedy
955 Panicles oblong flexuose capillary spreading, Glumes two-flowered, Leaves linear-lanc. Stem creeping
956 Panicled, Sheaths of the leaves ciliated lengthwise
957 Pan. short beardless, Stem much branched divaricating, Flower-stalks 2-flow. one shorter than the other
958 Panicles simple upright, Spikelets appressed, Leaves oblong lined plaited, Sheaths pubescent

959 Pan. spiked whorl. Invol. 1-fl. with hairs in bundles toothed hispid, teeth reversed, Herm. paleæ smoothish
960 Raceme spiked cylind. Invol. 2-fl. with hairs in bundles, hispid above, Herm. paleæ wavy crosswise
961 Pan spiked cylind. Invol. 2-fl. with hairs in bundles, hispid above, Herm paleæ smoothish, Sheaths downy
962 Spike comp. interrupted at base nodding, Spikelets heaped, Invol. setaceous much longer than flower
963 Spike comp Spikelets panicled in bundles, Bristles mixed with the florets very long, Pedunc. smoothish
964 Spike round, Involucres setaceous villous 1-flowered as long as florets, Leaves flat
965 Spike compound contracted, Spikelets heaped, Invol setaceous longer than the flowers, Rachis hairy
966 Spike elongated cylind. Invol. 2-fl. bristly, Herm. paleæ smoothish, Stem ascending, Sheaths smooth
967 Stem branched, Sheaths pubescent, Spike dense short, Setæ none, Paleæ smooth
968 Spike compound erect, Clusters remote, the lowest sessile, Setæ 8 times as big as florets
969 Sheaths very rough, Spike simple with naked setæ longer than florets

970 Spikes one-sided alternate, Glumes 2-fl bearded hispid
971 Spikes alternate one-sided, Spikelets subdivided, Glumes bearded hispid, Rachis triangular
972 Spikes alternate and in pairs, Spikelets subdivided, Glumes bearded hispid, Rachis 5-angular

973 Spike compound, Spikelets appressed alternate, Glumes torn, All the valves bearded outer largest
974 Bundles about ten, Rachis very hairy, Glumes bearded smooth a little fringed, Leaves ovate acum wavy

975 Joints of the stem smooth, Involucres ciliated
976 Joints of the stem villous, Involucres rough



977 The only species

978 Beard feathered
979 Flowers panicled spiked nearly included in the sheaths, Beard feathered
980 Beard naked straight, Glumes longer than the seed, Leaves smooth inside
981 Panicled, Beards naked twice as long as glumes, Seeds woolly
982 Beard naked rough twisted in various directions
983 Beard hairy at base, Panicle spiked, Leaves filiform

984 Panicles branched compressed, Leaves linear smooth, Stem diffuse

985 The only species. A plant looking like a Polypogon

986 The only species

and Miscellaneous Particulars.

147. *Orthopogon.* Ὀρθός, straight, and πώγων, a beard, because the beards of the flower are straight, and not jointed. This plant is cultivated in the low and marshy lands of Jamaica as fodder.
148. *Penicillaria.* From *penicillus*, a pencil, in allusion to the soft hairy appearance of the spikes.
149. *Lappago.* The flowers are rough, with little prickles like Lappa or Burdock.
150. *Stipa.* From στυπη, silky or feathery material. S. pennata has beautifully feathered beards which distinguish it from all other grasses. Gerarde says, they were worn in his time by "saundry ladies instead of feathers." S. tenacissima is used in Spain for the same purposes as Lygeum spartum, and like it, is called Esparto. It is supposed by some to be the plant so called by the ancients.
151. *Muhlenbergia.* Named in honor of Dr. Muhlenberg, an eminent North American botanist. A North American genus of grasses.
152. *Chaeturus.* From χαιτη, a head of hair, and ουρα, a tail. So named by Link, from the silky appearance of the panicles.
153. *Lagurus*; λαγος, a hare, and ουρα, a tail; hare's-tail, which its heads resemble.

History, Use, Propagation, Culture,

154. *Polypogon.* Named by M. Desfontaines from πολυ, much, and πωγων, beard, in allusion to its bearded heads.

155 *Gastridium* From γαστριδιον, a little swelling: the glumes are ventricose at the base. A very small grass, formerly referred to Milium.

156. *Agrostis* Derived from ἀγρος, a field. Agrostis was the name given by the Greeks to all grasses. Of this genus the most remarkable species is the A stolonifera or florin, so much recommended by Dr. Richardson; but respecting which the opinion of practical men is still unsettled, and, on the whole, rather unfavorable than otherwise. It seems to suit the climate and soil of Ireland, and to be more productive and nutritive there than any where else. In the account of the Woburn experiments on grasses, it is observed of florin, that it appears to possess "merits well worthy of attention, though, perhaps, not so great as has been supposed, if the natural place of its growth and habits be impartially taken into the account." It is called squitch, quick, &c. like the common couch-grass, from the length of time it retains its vital power Like other plants, which propagate themselves abundantly by extension of their parts, it rarely bears seeds, and is therefore propagated by cuttings of the stems laid along drills an inch deep, and slightly covered with soil. A vulgaris, which in dry arable land is called the black quitch, is the most common and earliest of the bents, but inferior to several in produce, and the quantity of nutritive matter it affords. The bents are generally rejected by the agriculturist on account of their lateness of flowering; but this circumstance, as Sinclair observes (*Davy's Agr Chem.* App. LXXV.) does not always imply a proportional lateness of foliage A. vulgaris is in leaf by the middle of April. A. stolonifera is two weeks later, and A. nivea, and repens, three weeks later. In the south of France and Italy, the poor people collect the stolons of different species of agrostis by the roadsides and hedges, and expose them for sale in the market places in small bundles, as food for horses.

997 Panicle contracted, somewhat spiked, Glumes somewhat pubescent with a smooth edge

998 Panicle spiked ventricose at base, Glumes acuminate shining, Flowers bearded

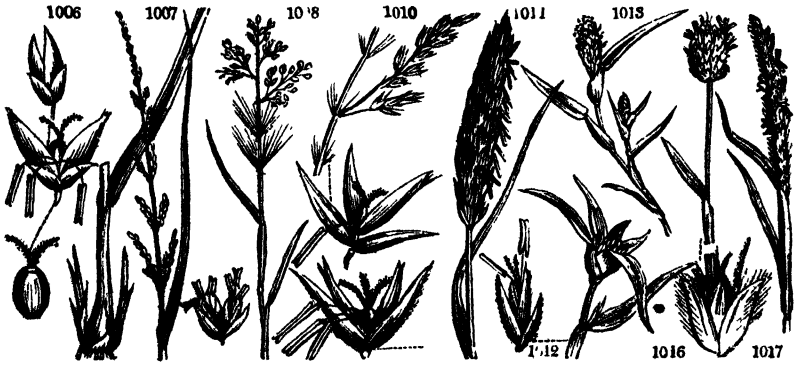
999 Flowers beardless

990 Panicle whorled spreading, Beard very long below the end of the outer palea (*Apera* P. de B.)
991 Panicle much spreading, Beard bent inwards, Palea hairy, Culm ascending branched at the base
992 Glumes linear-lanc. bearded, Palea naked, Beard nearly term. straight, Culm decumbent (*Vilfa* P de B)
993 Branches of pan. smoothish, Branchlets at the time of flow. divar Ligula very short trunc. (*Vilfa* P de B.)
994 Branches of pan. hispid, Fl. purple, Branchlets much spreading rather lax, Ligula oblong (*Vilfa* P. de B)
995 Pan. contracted, Culm branched creeping, Flowers clustered, Glumes equal lanc. pubesc (*Vilfa* P. de B.)
996 Branches of pan. hispid, Fl. white, Branchl. much spreading rather lax, Ligula oblong (*Vilfa* P de B.)
997 Whorls of the pan. approxim. closely covered all over with flowers, Florets beardless (*Vilfa* P de B.)
998 Panicle contracted beardless, Glumes equal, Flowers viviparous (*Vilfa* P de B)
999 Beard term. curved, Hairs longer than palea, Panicle diffused, Glumes acumin. (*Achnatherum* P. de B)

1000 Pan. very branching, Branches trichot. much sprdg hispid, Glumes acute, Palea beardless, Stem decumb.
1001 Branches of panicle di-trichotomous roughish, Glumes acute, Leaves of stem wider than those of root
1002 Branches of panicle nearly 3-chotomous roughish, Glumes acuminate, Palea with two short beards at end
1003 Glumes lanceolate, Palea with a jointed beard at their base, Radical leaves setaceous
1004 Culms erect, Leaves narrow short, Sheaths roughish, Panicle very capillary and loose

1005 A little agrostis-like plant. The only species

1006 Panicle contracted beardless, Racemes lateral erect alternate
1007 Pan. elong. contr. nearly spiked, Florets beardless, Glumes uneq twice as short as palea which are uneq



1008 Panicle spreading, with a setaceous involucre, Florets beardless

1009 Panicle contracted beardless, Flowers acuminate often monandrous, Leaves flat rough
1010 Panicle much branched oblong close, Branches erect, Palea beardletted, Ligula torn

1011 Panicle spiked, Glumes acute, Hairs 3 times as short as palea, Leaves involute

1012 Stems branched compressed, Panicle spiked hemispherical surrounded by a leafy involucre, Diandrous
1013 Stems branched compressed, Panicle spiked oblong sheathed at base, Triandrous

1014 Stem erect, Spike very simple attenuated, Glumes distinct villous, Root bulbous
1015 Stem erect smooth, Pan. subspiked cylindrical obtuse thick, Glumes fringed connate below the middle
1016 Stem erect smooth, Spike ovate, Glumes villous bearded nearly as long as the beard of the palea
1017 Stem generally erect roughish upwards, Panicle spiked cylind. acute, Glumes connate below the middle

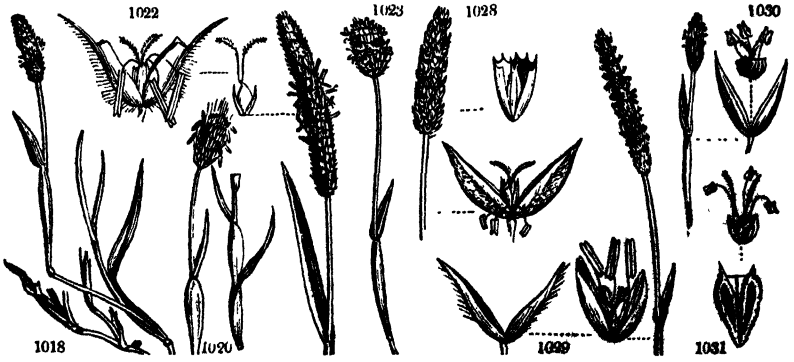
and Miscellaneous Particulars.

157. *Trichodium.* Named from θριξ τριχος, hair, on account of its capillary inflorescence. T. decumbens is the famous Agrostis cornucopiæ of Fraser, respecting which so much was said some years ago; but which upon trial did not prove so valuable an agricultural grass as it was represented to be

158. *Tristegis* From τρεις, three, and στεγη, a covering, on account of the three glumes or valves of the calyx.

159. *Sporobolus.* From σπορος, a seed, and βαλλω, to cast forth. Its grains are loose, and easily fall out of their husks.

160. *Atropis.* A word formed by M. Desvaux, from Aira, and ωψ, like. The genus resembles Aira in appearance.



161. *Cinna.* An ancient name used by Dioscorides, who ascribes heating and stimulating qualities to this grass when eaten by cattle, whence the name (from κινω, to heat). Linnæus applied it to this genus of American grasses.

162. *Psamma.* From ψαμμος, sand, in which this grass grows in vast abundance on the sea-coasts of Europe. P. arenarium has a strong creeping perennial root with many tubers at the joints, the size of a pea. It is planted and encouraged on the coast of Norfolk to aid in fixing the sand against the action of the wind and tides, which it effects in a surprising manner. The marrum, as it is called, is considered of so much importance that there are severe laws to prohibit its being destroyed. Mats are made of it, and it is used as thatch.

163. *Crypsis.* From κρυπτω, to conceal, the heads of flowers being at one time concealed in the sheaths of the leaves.

164. *Alopecurus.* Αλωπηξ, a fox, and ουρα, a tail: fox-tail. A. pratensis is one of the best of meadow-grasses, possessing the three great requisites of quantity, quality, and earliness, in a superior degree to any other It is

History, Use, Propagation, Culture,

often fit for the scythe by the middle of May; it flowers twice a-year, and gives more bulk and weight of hay than any other grass. At Woburn the produce was nearly three-fourths greater from a clayey loam than from a sandy soil, and the grass from the latter was of comparatively less value in the proportion of four to six. What is almost peculiar to this grass, Poa pratensis and Anthoxanthum odoratum, the value of the grass of the latter math considerably exceeds that of the crop at the time of first flowering. A. geniculatus, and most of the other species of this genus (A. agrestis excepted) are valuable grasses both for hay and pasture.

165. *Phleum.* We have no information as to what the φλεως of the Greeks was. The name being unoccupied has been applied by Lannæus to this plant. Some think the plant of the ancients was our Typha. P. pratense, the timothy-grass (so named from Timothy Hanson, who brought it from New York and Carolina about 1780), varies much in size according to soil and situation, and the root becomes bulbous in very dry grounds. Opinions are different as to its merits. Dr Walker (*Rural Econ. Hebrides*, ii 27.) thinks it may be introduced into the Highlands with good effect. W. Salisbury says, it is coarse and late. At Woburn, its "comparative merits were considered very great. It produces abundance of fine foliage early in spring, which, as it flowers late, may be cropped till an advanced period of the season without injury to the crop of hay." Unlike the Alopecurus pratensis, the value of the grass as hay when the seed is ripe is to that when it is in flower as 10 to 23. P. nodosum has gibbous joints, which might have been expected to be sugary like those of Florin, which, however, is not the case, as Sir H. Davy found them to be less nutritive than those of P. pratense, in the proportion of 8 to 28.

166. *Achnodonton.* From αχνη, a chaff or husk, and οδους, a tooth, in allusion to the toothed palea or inner valves of the flower.

167. *Chilochloa.* A genus formed by M. de Beauvois, to contain certain grasses referable to both Phalaris and Phleum, as formerly constituted. The name is derived from χειλος, fodder, and χλοη, grass; but none of the species are remarkable for their qualities as grasses useful in husbandry.

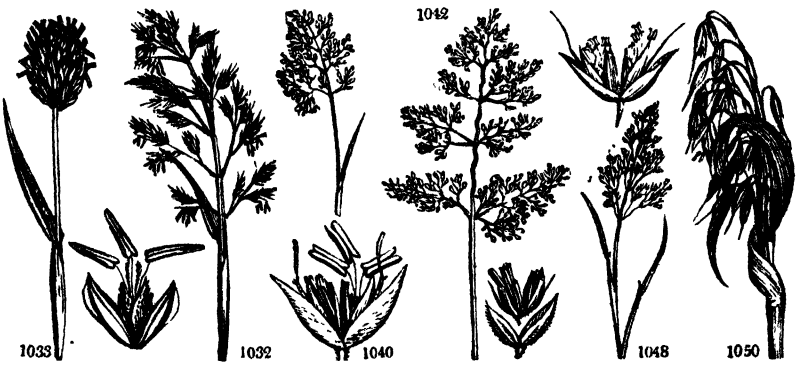
1018 Stem ascending knee-jointed, Panicle spiked cylindrical obtuse, Glumes connate at base obtuse
1019 Stem ascending knee-jointed, Spike compound cylindrical, Glumes obtuse fringed, Anthers orange col.
1020 Stem ascend. Raceme spiked ov. Glumes with a hairy keel beyond the mid. dilated, Upper sheath inflated
1021 Stem erect, Pan. spiked cylind. atten at base, Glumes vill. fringed, Beards of paleæ twice as long as glumes

1022 Raceme spiked cylindrical, Glumes truncate mucronate with a fringed keel, Beard shorter than glume
1023 Raceme spiked ovate oblong, Glumes truncate mucronate with a fringed keel, Beard as long as glume
1024 Like P. pratense, but stems lower, Raceme shorter, Root knotty. A mere variety
1025 Spike ovate, Beard longer than glume divaricate angular rough, Root fibrous
1026 Panicle hairy spiked cylindrical, Glumes lanceolate acuminate with a fringed keel

1027 Glumes keeled smooth membranous at edge
1028 Outer glume a little prickly at the back

1029 Panicle spiked cylindrical smooth, Glumes lanceolate mucronate obtuse roughish

1030 Panicle spiked oblong ovate, Glumes lanceolate acute with a fringed keel, Stems ascending



1031 Panicle spiked cylindrical, Glumes wedge-shaped mucronate rough

1032 Panicle spreading heaped, Outer paleæ penciliform, inner shining
1033 Panicle spiked ovate, Glumes navicular entire at the end, Outer paleæ 2
1034 Panicle spiked oblong ovate, Glumes navicular toothed at end, Outer palea 1
1035 Panicle spiked oblong, Glumes navicular nearly entire, Outer palea 1, Stem knee-jointed
1036 Stem naked upwards, Spike slender lax, Glumes keeled acute
1037 Pan. spiked cylindrical, Intermediate floret hermaphrodite acuminate, the rest imperfect bitten off
1038 Panicle diffuse, Glumes acute shorter than florets, One floret hermaphrodite, one neuter
1039 Panicle beardless cylindrical spiked, Paleæ 2 smooth, Root bulbous

1040 Pan spreading afterwards contracted, Florets less than glume, Beard clavate less than glume

1041 Pan diffuse, Glumes obtuse, Florets longer than glumes (*Catabrosa* P de B)
1042 Panicle diffuse, Florets as long as glumes, Beard straight short, Leaves flat (*Deschampsia* P. de B.)
1043 Pan contr Glumes bearded villous at base, Rachis smooth very short, Leaves flat (*Deschampsia* P. de B)
1044 Beardless, Panicle lanceolate lax erect, One floret stalked the other sessile, Leaves pubescent
1045 Leaves bristly, Stem naked, Panicle lax, Florets hairy at base, Beard nearly terminal shorter
1046 Pan. divar Branches trichot. Flor 3-fl larger than glumes, Beard jointed longer than glumes, Leaves set.
1047 Bearded, Pan spreading trichot. Peduncle wavy, Florets scarcely longer than glume, Leaves setaceous
1048 Bearded, Pan trichot. divar. Florets less than glume, Beard dorsal jointed longer than glume

1049 Pan one-sided, Spikelets short 2-flowered, Florets as long as glume obtuse 2-toothed at end, Root fibrous
1050 Pan 1-sided contracted, Spikelets 2-fl less than glumes, One floret beardless, Root fibrous

and Miscellaneous Particulars

168. *Phalaris.* An ancient name said to have arisen out of φαλος, brilliant, because the plant had shining grains. P. canariensis is cultivated for the seeds, which are given to singing birds, and more especially the canary. It requires a loamy soil, well manured, clean, and in good tilth. The grain is sown in February, in drills, six inches apart, and the plants are thinned to two inches distance in the rows. The growth of canary grass is slower than that of the common weeds, with which it is in consequence liable to be overrun, if they are not kept under by hoeing and hand-weeding. The culture of this grass is chiefly carried on in the isle of Thanet, where the chaff is esteemed as a horse food; but the straw being short, it produces little fodder or manure.

169 *Corynephorus.* From κορυνη, a club, and φερω, to bear. The beard is jointed, and the last articulation is club-shaped.

170. *Aira*, is the name applied by the Greeks to the Lolium of the Romans, our Lolium temulentum. It signifies "something deadly," in allusion to the dangerous effects of that plant; but the name has no reference to any species of the genus to which it has been applied by Linnæus. A. aquatica is relished by cattle, and water-fowl are fond of the young shoots and seeds. It is introduced in decoys, by throwing plants in the water with a weight tied to them. A. cæspitosa is common in marsh-meadows, and occasions those excrescences called tussocks or hassocks which interrupt the progress of the scythe. Though cows eat the grass, horses will not. The stiff erect stalks frequently bear viviparous flowers.

171. *Avena.* A name of obscure origin. De Théis thinks it has been derived from the Celtic word *aten*, which comes from *etan*, to eat; and whence our common word nit, oat, has been obtained. A. sativa is the common cultivated oat, and A. nuda and tartarica are also sometimes cultivated. Of the first species there are numerous varieties, some more permanent, as the white and black; others temporary, as the potatoe oat, Angus oat, &c. No botanist has been able to ascertain satisfactorily the native place of this or any other of our cultivated grains. A. fatua is accounted a distinct species, but some think the naked, tartarian, common,

History, Use, Propagation, Culture,

and wild oat originally the same. The wild oat is remarkable for the length of time the grain will lie in the soil, and retain its vegetative powers, its awns are sometimes used as hygrometers, and its seeds as artificial flies in fishing Where it abounds naturally it is an inveterate weed.

The oat, in an agricultural point of view, is a grain only calculated for cold climates In Italy and France, and even in the southern counties of England, the ears are small and husky, and afford little meal; the panicle is open, and the foot-stalks of the ears small, and in July and August the heat dries them up, and obstructs the progress of the sap to the grain On the other hand, this naked airy panicle is better for drying after rains and dews than the close spikes of wheat and barley, which, while they serve to guard the ears from the extremes of heat in warm climates, are apt to rot or become mouldy (covered with fungi) in cold moist countries or seasons. The grain of the oat, though chiefly used as food for horses, is also more or less a bread corn in every country where it is generally cultivated. Fourteen pounds of grain yield eight pounds of meal; in some places, as Yorkshire and Aberdeenshire, this meal is ground nearly as fine as flour; in others, as at Edinburgh, it is made of a coarser quality The kernel freed from the husk, and entire, is used for gruels, and forms an article of commerce with Embden, Bremen, and some towns where the grains are grown to a large size on the variety known as the Friesland oat. The fine powder which is produced by the operation of husking the corn, or making grist, forms a jelly, the sowens of the Scotch, and furmerty of the Irish, an agreeable and wholesome food. Water-gruel from a coarse oatmeal, is esteemed a cooling laxative drink.

A. nuda, the naked, or hill-oat, or peel-corn, when ripe drops the grains from the husks. It was generally cultivated in Worlige's time "in the north of England, Scotland, and Wales, because the kernel threshes clean out of the husk, and need not be carried to the mill to be made into meal or grist." It was made into meal by the lower classes, by drying on the hearth, and bruising in a stone mortar, as still practised in the Highlands of Scotland, in Lapland, Ceylon, China, and in every country under certain circumstances of civilization. In the low country of Scotland, the quern mills, as they were called, now no longer in use, may be seen neglected or dilapidated, by the doors or about the gardens of cottages and villages, where they were formerly in use.

Avena sterilis is sometimes grown as an object of curiosity, under the name of the animal oat, on account of its singular hygrometrical properties. After the seeds have fallen off, the strong beard is so sensible of alter-

1051 Pan. equal, Spikelets 2-fl. Florets smaller than glumes at the base naked 1-bearded, Root fibrous
1052 Pan equal, Spikelets 3-fl. longer than glumes, Florets naked at base, Root fibrous
1053 Pan. equal, Spikelets 3-fl. Florets less than glumes, hairy at base, all bearded, Root fibrous [fibrous
1054 Pan. 1-sid. Spikel. 5-fl. Florets less than glumes lower bearded and hairy upper beardless and smooth, Root
1055 Rac. simp. Spikel. 5-fl. Flor long than glms Lvs. rough in tufts very narrow and complicated, Root fibrous
1056 Pan. sub-spiked, Florets nearly equal to the glume, Beard jointed longer than glume, Leaves setaceous

1057 Pan. spread. Glumes 3-fl. Florets linear 2-bearded at end very hairy below the middle, Beard dorsal-jointed

1058 Pan. equal, Spikelets about 3-fl. Florets longer than the glume the lower with a beard under the end
1059 Pan. contracted 1-sided, Spikelets 2-fl Outer glume bifid 2-bearded, Dorsal beard reflexed
1060 Pan lax, Outer glume bifid, Spikelets 3-fl. Ligula truncate obsolete, Lower sheaths pubesc. Root creeping

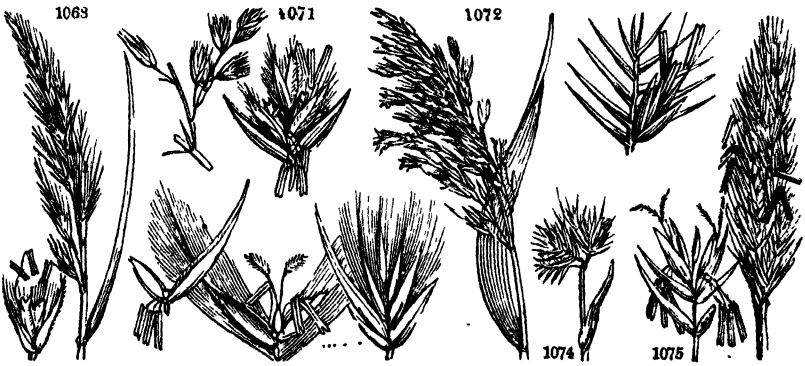
1061 Pan. slender, Glumes 2-fl Seeds villous, Beard twice as long as glume
1062 Pan sub-spik. equal, Spikelets about 3-fl. Florets longer than cal. hairy at base, Lvs pubesc. Root creeping

1063 Pan. erect nearly simp. Glumes about 5-fl. Recept bearded at end, Leaves serrulate naked, Sheaths rough

1064 Pan. equal, Spikel. 3-fl. Flor as long as glume, Lvs distichous smth. Mouth of sheaths hairy, Root creeping
1065 Panicle nearly spiked, Beard at length reflexed longer than glume

1066 Panicle one-sided, Spikelets 3-flowered, Florets 3-bearded as long as glume, Root fibrous

1067 Spike jointed brittle 3 or 4 inches long, Leaves flat slightly hairy



1068 Pan upright sprdg. Glumes acum Dorsal beard straight shorter than the hairs which are as long as glume
1069 Pan upright spreading, Glumes acute, Dorsal beard straight as long as palea which is longer than hairs
1070 Panicle spreading, Glumes acute, Hairs very short, Dorsal beard jointed longer than glume
1071 Glumes about 3-5-flowered, Florets as long as the glume, Stem woody at base (*Donax* P de B)

1072 Glumes 5-flowered, Florets very little longer than glumes

1073 Stems erect, Sheaths very smooth, Ligulas large elongated, Panicle close many-flowered
1074 Pan contr. ovate, Spikelets bearded, Leaves lanceolate, Bractes pinnate scarious with very long beards

1075 Raceme spiked cylindrical, Spikelets 3-flowered, Outer palea 3-5-bearded, Root stoloniferous
1076 Raceme spiked subovate oblong, Bractes entire, Spikelets 2-3-flow. Outer palea 3-5-bearded, Leaves flat

1077 Raceme spiked ovate nearly naked, Spikelets 2-flowered, Bractes toothletted, Outer palea 5-bearded
1078 Raceme in a round head, Outer palea with one beard, Leaves fine keeled

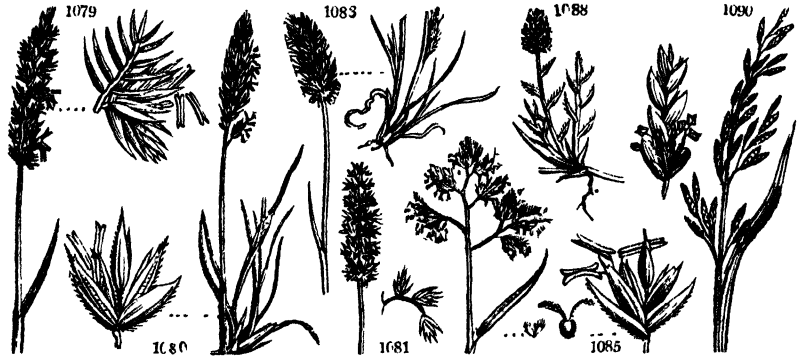
and Miscellaneous Particulars

ation in the atmosphere as to keep them in an apparently spontaneous motion, when they resemble some grotesque insect crawling on the ground.

172 *Trisetum.* (Three bristles), on account of the three beards or awns of the flower Trisetum pubescens, according to the Woburn experiments (VII.), possesses several good qualities, which recommend it to particular notice. It is hardy, early, and more productive than many others which affect similar soils and situations. It appears well calculated for permanent pasture on rich light soils. Trisetum flavescens is also a useful grass; but the most valuable as a grass is the Avena elatior, *L.* the Holcus avenaceus of Eng. Bot., which will be noticed hereafter in its proper place (In Polygamia monœcia, under *Arrhenatherum*)

173. *Danthonia.* A genus containing some incongruous species of Avena, and named after M. Danthoine, a French botanist.

174 *Gaudinia.* Named in honor of M. Gaudin, a Swiss botanist, who paid great attention to the study of grasses, and who published an Agrostographia Helvetica in 1811, still a work of reputation.



175. *Arundo.* An ancient name of doubtful origin, perhaps, as a recent author conjectures, from *aru*, the Celtic word for water. Phragmites is derived from φραγμος, a hedge or separation A. donax, *Canne*, Fr, *Rohr*, Ger., and *Canni di Giardini*, Ital. is common in the south of France and Italy, where it is cultivated as fence-wood, for supporting the vine, for fishing-rods, and a great variety of purposes. In Spain and Portugal it forms an article of commerce, and supplies materials for the looms, fishing-rods, &c. of this country. The striped-leaved variety (gardener's garters) used formerly to be a common inhabitant of gardens.

A. phragmites, *Roseau de Marais*, Fr. *Gemeine Rohr*, Ger.; and *Canna palustre*, Ital. is used for thatching, for protecting embankments or sea-dykes, for ceilings to cottages, verandahs, and rustic buildings, to lay across the frame of wood work as the foundation for plaister floors, and for screens and hot-bed covers in kitchen gardens. The panicles will dye wool green; and the roots, it is said, are good in liver complaints, like those of Triticum repens.

176. *Chrysurus.* From χρυσος, gold, and ὀυρὰ, a tail; the compact heads of flowers are of a bright yellow color.

177. *Scleria.* A genus named by Scopoli, after Leonard Sesler, a physician and botanist, who contributed to

History, Use, Propagation, Culture,

Vitaliano Donati's Natural History of the Adriatic sea, published in 1750. The species were formerly part of Cynosurus.

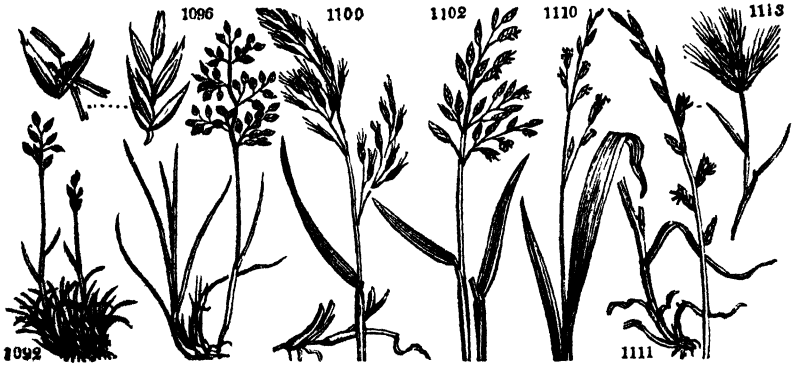
178 *Cynosurus* Κυων κυνος, a dog, and ουρα, a tail: dog's-tail

179. *Kœleria* Named after M Kohler, a professor of natural history at Mayence, and author of some works upon grasses A pretty genus of grasses, with elegant silky heads.

180 *Dactylis.* (Δακτυλος, a finger finger grass) The divisions of its heads may be fancied to resemble the fingers, and the large cluster at the bottom the thumb of an animal D glomerata is a coarse grass of early and rapid growth, and considered valuable as a pasture grass on light soils from the quantity of herbage it affords It comes in from the time turnips are over, till the meadows are fit for grazing, but old and dry, or made into hay, neither horses nor cattle are fond of it. To reap the full benefit of this grass, it must be kept closely cropt. It has been of late strongly recommended by Mr Coke of Holkham

181. *Glyceria* (From γλυκυς, sweet, in allusion to the herbage) This is the Festuca fluitans of L.: it is found in stagnant water, and its long narrow leaves float on the surface Horses, cattle, and swine are fond of this grass, which produces abundance of seeds, which are eaten greedily by geese, ducks, and fish, especially the trout (*Salmo fario*). These seeds are very nourishing, and are collected in some parts of Germany and Poland, under the name of manna seeds, and used in soups and gruels. The plant will not thrive unless on land that is constantly under water.

182. *Festuca.* In Celtic, the word *fest* signifies pasture, food. We may be satisfied with this explanation in want of a better This genus affords some valuable hay and pasture grasses. F. ovina has a fine short sweet foliage, well adapted to the masticating organs of sheep, and for producing delicate mutton: it is totally unfit for hay, and according to Sir H Davy's experiments, it does not possess the nutritive powers generally ascribed to it. It is an excellent grass for lawns, requiring little mowing, and forming so thick a turf as to suffer few intruding plants. It should be sown about the middle of August, on ground nicely prepared, open, and not too light or dry. The same remarks will apply to F rubra and amethystina.



1079 Raceme spiked linear, Spikelets beardless, Bractes pinnatifid, Leaves linear

1080 Pan. spike-shaped at the base interrupted and smoothish, Spikelets 3-4-flow. nearly beardless very acute
1081 Pan. closely spiked, Spikel. 2-3-fl. scum. beardless, Glumes fringed at back, Lower leaves conv setaceous
1082 Pan. spiked oval cylind. Spikelets 2-flowered villous at back acumin. Outer glume bearded under the end
1083 Panicle spiked cylind. Spikel. 2-5-8-flowered, Outer glume rough outside, with a soft beard under the end
1084 Panicle spiked ovate cylind. Spikelets 3-4-flowered, Outer glume hairy with a stiff beard under the end

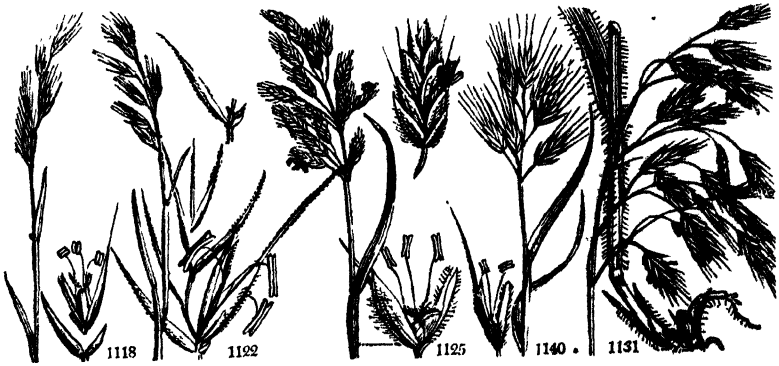
1085 Panicle one-sided heaped, Leaves keeled
1086 Panicle one-sided headed spiked, Spikelets 3-flowered, Leaves keeled glaucous
1087 Panicle equal before and after flowering contr spiked, Spikelets 4-fl. beardless, Glumes with a rough keel
1088 Stem creeping, Branches in bundles, Leaves villous subulate stiff, Flowers in spiked one-sided heads
1089 Spikes scattered one-sided few, Flowers closely imbricated, Leaves much spreading, Stem decumbent

1090 The only species is a floating creeping plant very common in ponds

1091 Panicle simple one-sided, Spikelets about 9-flow. bearded, Leaves setaceous, Culm upwards 4-cornered
1092 Panicle contracted, Spikelets ovate 4-flowered, Paleæ roundish, Leaves very narrow rough
1093 Panicle one-sided contracted, Florets compressed beardless pubescent, Leaves setaceous smooth
1094 Pan. one-sided erect spreading, Florets roundish longer than beard, Leaves pubes. above, Root creeping
1095 Panicle erect spreading, Florets longer than beard, Root fibrous
1096 Pan. sprdg. Spikel. obl. nearly beardl Outer valve of glume and paleæ ciliated, Lvs setac. rigid, Lig 2-eared
1097 Glaucous, Pan. 1-sided contracted, Florets cylind. bearded, Stem square, Leaves compound channelled
1098 Panicle spike-shaped pubescent, Leaves filiform
1099 Panicle one-sided erect branching contracted, Florets oblong angular beardless, Leaves ensiform striated
1100 Panicle spreading, Spikelets 3-flowered with long beards
1101 Panicle erect, Spikelets ovate 4-5-flowered, Glumes acum. beardless, Leaves setaceous smooth pungent
1102 Panicle spreading branched, Spikelets linear beardless many-flowered, Leaves linear, Root fibrous
1103 Pan. sprdg one-sided, Spikel. about 6-fl. Florets blunt beardless, Leaves lin conv glauc Stem round erect
1104 Panicle spike-shaped, Spikelets slender 11-flowered bearded, Sheaths rough
1105 Culm ascending angular, Leaves rolled together smooth, Pan nodding close, Spikelets 9-10-flow pilose
1106 Pan. erect contracted, Spikelets 4-5-fl very smooth, Paleæ margined membranous, Leaves setaceous
1107 Pan. one-sided oblong, Spikel. 7-fl. bearded, Outer glume and paleæ fringed, Leaves setac. Root fibrous
1108 Panicle one-sided erect branching, Florets ternate oblong angular beardless, Leaves linear striated
1109 Pan. spreading much branched, Spikelets ovate lanc somewhat bearded 4-5-fl. Leaves linear lanceolate
1110 Pan close, Branches simple scattered, Spikelets linear 5-fl. Flowers acum. 2-androus, Stem very rough
1111 Raceme spiked elongated, Spikelets remote beardless afterwards spreading, Root fibrous
1112 Panicle simple erect, Spikelets very few about 7-flowered, Florets acute distant
1113 Panicle fascicled, Spikelets subsessile villous, Beard erect
1114 Panicle one-sided spike-shaped, Spikelets 5-fl. smooth somewhat bearded, Leaves glaucous rigid subulate
1115 Culm ascending, Leaves subconvolute, Spike racemose, One glume very small, Outer paleæ fringed
1116 Panicle one-sided erect nodding at the end, Spikelets 5-flowered obtuse beardless
1117 Panicle loose spreading nodding, Radical leaves very slender and long, Root creeping

and Miscellaneous Particulars

F. durinscula, is a good grass either for hay or permanent pasture · hares are remarkably fond of it its produce in the spring is not very great, but the quality is fine, and the quantity is considerable at the time of flowering. F. calamaria is subject to the disease in the grain called clavus, in which the seed swells to three times the usual size, and the kernel is wanting.



F. pratensis is one of the six grasses (Anthoxanthum odoratum, Alopecurus pratensis, Poa pratensis and trivialis, Cynosurus cristatus, and the F. pratensis) which Curtis recommends before all others for laying down meadows or pastures, on soil either moist or moderately dry. According to the Woburn experiments, the value of this grass cut at the time the seed is ripe, is to that of the grass cut at the time of flowering as 6 to 18, one proof, among many others, of the advantage of cutting almost all grasses when in flower rather than later. W. Salisbury says, "if land intended for meadow could be laid down with one bushel of F. pratensis, one of Alopecurus pratensis, three pounds of Anthoxanthum, a little Bromus mollis, with white clover, the farmer will seek no farther."

F. elatior differs little from F. pratensis, but in being larger in every respect. According to the Woburn experiments (xi.) "the produce is nearly that of the former, and the nutritive powers superior in the proportion of 8 to 6."

F. loliacea greatly resembles the rye-grass in habit and place of growth: "it has excellencies which make it greatly superior to that grass, for the purposes either of hay or of permanent pasture. It improves in proportion to its age, which is directly the reverse of rye-grass." (*Wob. exp.* xxxiii.)

F. glauca, cut at the time of flowering, exceeds in value the same grass cut when the seeds are ripe in the proportion of 6 to 12, a strong proof of the value of the leaves and culm in grasses intended for the scythe, and the loss, as we have before observed, of leaving them for the sake of the seed when they become dry and wiry. After this grass, and indeed most others, are in flower, "the root leaves neither increase in number nor in size, but a total suspension of increase appears in every part of the plant, the roots and seed-vessels excepted." (*Wob exper.* xii.)

History, Use, Propagation, Culture,

183. *Mygalurus.* Named by Link, from μυγαλη, a mouse, and ὐρα, a tail.. An alteration of the previous specific name of one of the species, Festuca myurus, L. A natural genus, better distinguished by natural than by artificial characters.

184. *Bromus* Βρωμος is the name given by the Greeks to a sort of wild oat. Most of the species of this genus are of a coarse quality, and being strictly annuals are of little value as pasture, and as hay produce no after math. Sir H Davy found that the nutritive powers of the straws and leaves of most of the species were greatest when the plant is coming into flower; because, like all other plants strictly annual, or which do not shoot up again from the root the same season, when left till the seed is ripe, the leaves and straws become dried up. B. secalinus is often found among rye and wheat crops, the seeds when ground among the flour are said to impart a bitter taste to bread, and to have similar narcotic qualities as Lolium temulentum. In Scania, the panicles are used to dye green, and there, as formerly in Britain, rye was supposed to degenerate into this grass. The seeds of B. mollis are said to bring on giddiness in the human species and quadrupeds, and to be fatal to poultry. B. asper is the tallest of British grasses; it has had many names, but is distinguished from all

1118 Panicle one-sided nodding elongated, Florets rough at end, Leaves setaceous keeled very short

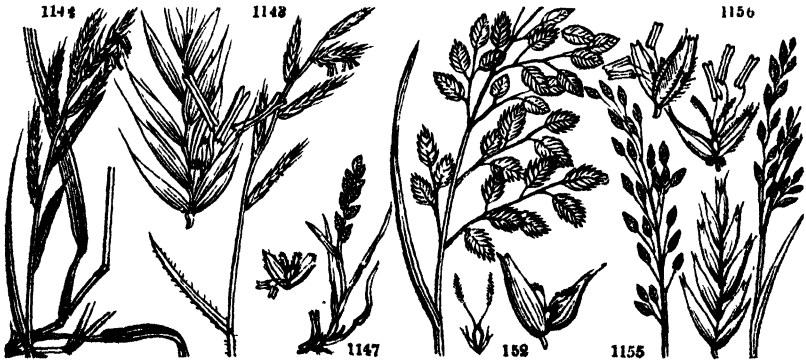
1119 Panicle one-sided erect, Florets rough at the end, Leaves setaceous shorter than their sheath

1120 Panicle nearly erect, Flower-stalks ensiform dilated
1121 Panicle one-sided spiked lanceolate, Spikelets spreading 5-flowered, Leaves linear setaceous
1122 Panicle one-sided erect nearly simple, Florets subulate compressed, One glume very short

1123 Panicle in seed nodding at end, Spikelets ovate oblong compressed naked, Florets at last distinct, Beard wavy shorter than glume, Leaves nearly smooth
1124 Pan. nodding at end, Spikelets lanc. compr naked, Beard straight longer than glume, Leaves villous
1125 Pan erect contr. Spikelets oblong ovate roundish pubes. Outer palea bifid, Beard straight, Leaves soft
1126 Pan nearly erect, Spikelet lanc. somew. compr. Flor closely imbr smooth, Beard straight afterwards sprdg.
1127 Pan lax nodd. at end, Spikel. lanc somewhat compr Florets closely imbr. Beard at length very much sprdg.
1128 Panicle close erect, Spikelets oblong pubescent 12-15-flow. nearly sessile, Beards below spirally twisted
1129 Pan. nodd. Spikelets lanc slender, Florets bearded hairy, Beards straight, Leaves smooth, Sheaths hairy
1130 Pan. erect, Spikes lin slenderish naked, Florets imbr nearly beardless, Leaves smoothish, Root creeping
1131 Pan nodd. one-sided, Spikel. lin. lanc. compr pubesc Beard straight shorter than glume, Leaves vill. rough
1132 Panicle spreading branching, Spikelets ovate turgid 10-flowered, Florets elliptical 3-nerved on each side
1133 Pan. spreading nodding at end, Spikelets rough lin lanc Beard straight longer than glume, Leaves pubesc.
1134 Pan. at length nodding, Spikelets lanc compr naked, Beards straight as long as glume, Leaves villous
1135 Pan erect, Spikel. lin lanc compr Florets imbr Beard shorter than glume, Leaves tufted very narrow cil.
1136 Pan. nodding at end, Spikelets compressed and leaves pubescent, Beard straight about length of glume
1137 Pan. nodd Spikelets oblong 6-fl pubesc Outer glume with a short beard, Leaves sheaths and stem smooth
1138 Pan. erect, Spik. obl ov compr nak. Flor imbr. Outer pal undiv Beard straight as long as glume, Lvs. pub.
1139 Leaves villous, Panicle spreading erect, Beards long straight, Rachis pubescent
1140 Pan. erect, Spikel rough lin lanc Flor. diandr Beards straight about length of glume, Lvs nearly smooth
1141 Pan. nodding at end one-sided, Spikel. lanc. compr naked, Florets imbr. Beard flexuose longer than glume

1142 Panicle loose capillary pendulous, Spikelets 6-fl compr. Outer palea with a short beard villous at edge
1143 Raceme spiked distich simple somew. nodd. Spikel. rem. erect, Upper beards longer than glume, Root fibr.

1144 Spike sim. distich. erect, Spikel. altern pub. bearded, Beard shorter than its valve, Lvs. pub. Root creeping



1145 Spikes in pairs terminal oblong, Florets lanceolate distichous bearded, Culm 2-knotted smooth equal
1146 Spikelets many-flowered 5-9-flowered beardless, Glumes and palæ obtuse, Leaves setaceous
1147 Glume many-fl. Spike simple compressed, Spikelets ovate unilateral, Glumes 3-nerved, Florets beardless

1148 Spike distichous compressed, Spikelets lanceolate oblong sessile
1149 Stem branching creeping rough, Leaves convol. obtuse rigid smooth, Alternate spikel. bearded smooth
1150 Glumes one-sided alternate beardless

1151 Panicle lax, Spikelets ovate with long stalks, Glumes 3-valved, Florets 1-androus, Keel pubescent
1152 Panicle long, Spikelets subsessile, Glume many-valved, Florets 3-androus, Keel smooth, Leaves convol.
1153 Nearly spiked, Leaves involute rigid
1154 Raceme spiked branching erect, Spikelets 5-9-flowered beardless smooth, Leaves involute subulate

1155 Panicle large, Stem firm, Spikelets lanceolate 6-8-flowered, Leaves and stem smooth

1156 Panicle erect contracted oblong, Branches chiefly simple numerous setaceous, Spikelets appressed oblong slender 8-10-flowered, Leaves very long smooth

and Miscellaneous Particulars.

others by the hairyness of its stalks. It is found in copsewood in clayey moist soils. Bromus giganteus partly resembles it.

185. *Brachypodium.* From βραχυς, short, and ποδ, a foot, in allusion to the short stalks of the spikelets. An artificial genus, made up of various species of Bromus, Festuca, and Triticum of former writers.

186. *Uniola.* Named by Linnæus, on account of the union of the glumes. A fine N. American genus, resembling a gigantic Bromus or Festuca. It is chiefly found upon the sands of the sea-coast.

187. *Tricuspis* A word signifying three points, in allusion to the structure of its flower This grass is called *Red-top* in the southern states of N America. Pursh says, "a most excellent grass. I have seen mountain meadows in Pennsylvania where they mow this grass twice a-year, producing most excellent crops each time without manure or any other trouble than the mowing, lasting for the space of sixteen years without the least decline in the crops, the soil at the same time being a very indifferent one"

188. *Diplachne.* Διπλοος, divided, αχυη, chaff. The outer palea is divided at the end, and bearded between the divisions.

History, Use, Propagation, Culture,

189. *Ceratochloa.* The seed having three little horns, the name has been contrived in reference to that circumstance: κερας, a horn, and χλοη, grass

190. *Schismus.* From σχισμη, a cleft. The outer palea is emarginate or cleft.

191. *Triodia.* Τρεις, three, οδους, teeth, on account of the three teeth of the palea.

192. *Beckmannia* In honor of M. Beckmann, the celebrated author of the History of Inventions, and of a Lexicon Botanicum, published in 1801, besides other works.

193 *Melica.* A name applied in Italy to the Holcus sorghum, *L*, the pith of which is like *mel*, honey. M ciliata and nutans are curious grasses, deserving a place in botanic parterres

194 *Molinia* In honor of Giovanni Ignatio Molina, who wrote an account of the plants of Chili, published in 1782. Of M. cærulea, the fishermen of the isle of Sky make ropes for their nets, which they find will bear the water well without rotting None of the species are cultivated.

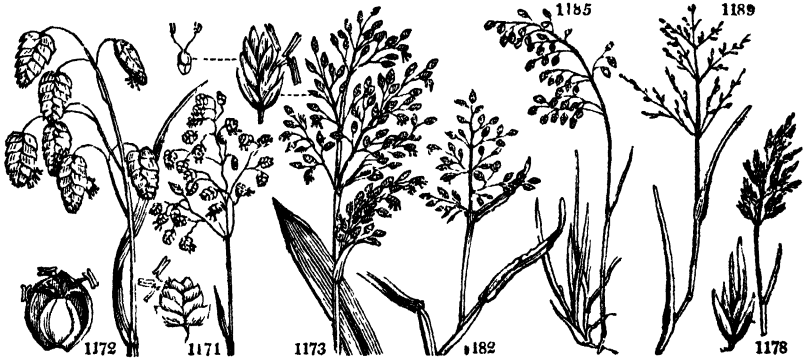
195. *Briza.* From βριθω, to balance, the spikelets being continually in a state of balance or suspension in the air. This is an ornamental or curious genus, of little value in agriculture The perennial species indicate a poor soil, and are bitter in taste. B. maxima is sometimes sown as a border annual

196. *Poa.* Ποη is the Greek name of herb This genus affords several valuable pasture, and some good hay grasses. P. aquatica is one of the tallest of British grasses, with a powerful creeping root, a native of most parts of Europe, and very common in the fens of Cambridgeshire and Lincolnshire, where it not only affords rich pasturage in summer, but forms the chief winter's fodder. It is sometimes cut thrice in one season. It grows not only in very moist ground, but in deep water, and with cat's tail, burr-reed, &c. soon fills up ditches, and occasions them to require frequent cleansing In this respect it is a formidable plant even in slow rivers. In the Isle of Ely they cleanse these by an instrument called a bear, which is an iron roller with a number of pieces of iron like small spades fixed in it, this is drawn up and down the river by horses walking along the bank,

1157 Panicle nodding spreading, Spikelets compressed 6-8-flowered, Sheaths of leaves bearded at end

1158 Panicle contracted, Spikelets linear, Glume longer than florets, Leaves bearded at base

1159 Panicle nearly simple contracted few-flowered, Spikelets oblong ovate 3-4-flow. Glume as long as florets



1160 The only species

1161 Outer palea of lower floret fringed, Panicle subspicate equal, Spikelets erect at length spreading
1162 Branches of panicle erect or spreading, Spikelets 3-flowered, Outer glume of lower floret hairy at edge
1163 Ligula nearly none, Panicle almost simple, Spikelets nodding beardless, Glumes obtuse
1164 Palea beardless, Panicle branching one-sided, Spikelets ovate erect 2-flowered one imperfect
1165 Ligula half-linear, Panicle branching, Spikelets nodding smooth, Glumes acute
1166 Panicle lax few-flowered, Branchlets simple, Flowers obtuse naked, Stem erect smooth
1167 Palea smooth, Panicle spiked branching, Spikelets 3-flowered third flower imperfect

1168 A small purplish grass common on moors with a very narrow smooth spikelike panicle

1169 Panicle erect, Spikelet 3-angular 5-7-flowered, Glume larger than florets
1170 Spikelets ovate, Glume equal to florets, Upper leaf involute
1171 Panicle erect, Spikelets finally cordate, about 7-flowered, Glume less than florets
1172 Panicle nodding at end, Spikelets oblong cordate 13-17-flowered

1173 Pan. equal erect diffuse much branched, Spikel lin 5-9-fl Florets obtuse smooth 7-nerved, Root creeping
1174 Panicle diffuse, Spikelets ovate 5-fl Ligule of the stem-leaves lanceolate acute, of the rest obtuse
1175 Panicle zigzag, Spikelets 3-flowered, Glumes ovate villous at base, Ligules lanceolate
1176 Panicle contracted erect or nodding, Leaves and stems lax, Ligule oblong
1177 Panicle diffuse, Spikelets ovate 5-flowered, Glumes lanceolate rather silky loose, Ligules very short
1178 Panicle equal diffuse, Spikelets ovate 2-4-flowered at length viviparous
1179 Pan equal diffuse, Spik obl ov about 3-fl Flor vill at base 5-nerved, Stem and sheaths roughish, Lig obl
1180 Panicle diffuse, Root creeping, Upper leaves much shorter than their sheaths, Ligule short truncated
β Panicle divaricating, Radical leaves very narrow and long
1181 Panicle diffuse, Spikelets ovate about 3-flowered, Glumes acute villous at base, Ligule very short obtuse
1182 Panicle one-sided divaricating, Spikelets oblong ovate 5-7-flowered, Stem subcompressed
1183 Panicle spreading, Spikelets ovate compressed acute, Outer palea pubescent at back
1184 Panicle equal diffuse, Spikel ovate lanc 3-fl Flor few, Sheaths loose 2-edged, Ligule short, Root creep.
1185 Panicle diffuse nodding, Spikelets oblong 5-7 fl Florets villous at base, Ligule short
1186 Panicle diffuse, Spikelets ovate oblong shining
1187 Panicle equal diffuse narrowed one-sided spreading when in seed, Root nodose
1188 Pan. equal sprdg Spikel lanc 9-fl Flor vill at base obtuse 5-nerved, Lvs rough, Ligule obl. Root creep
1189 Pan equal capill lax erect sprdg Spikel 4-5-fl smooth lin lanc Lvs smooth convol. at end, Stem procumb.
1190 Panicle lax much spreading capillary, Leaves hairy, Stem much branching
1191 Panicle contracted, Spikelets 7-9-fl cordate lanceolate shining, Glumes green lax

and Miscellaneous Particulars

and tears up the plants by the roots, which float, and are carried down the stream. (*Curtis.*) W Salisbury says, "it is highly ornamental, and might be introduced into ponds for the same purposes as Arundo phragmites, or planted with Festuca elatior, Poa sudetica, and Phalaris arundinacea in pits and water-holding excavations, where it would be useful as fodder, and form excellent shelter for game" (*Bot Comp.* ii. 11.)

P. alpina, in common with many alpine grasses which live almost constantly in a moist vapour, is frequently viviparous. Linnæus says, it is the rudiment of the germen which grows and forms the young plant; Sir J. E. Smith, that the glumes change into leaves, and at length the fructification into a bud.

P trivialis Curtis considers one of our best meadow and pasture grasses, especially for moist soils and sheltered situations, on dry exposed situations it is not productive, and, as Sinclair observes, dies off in the space of four or five years. Contrary to what is the case in almost all other grasses, the hay of this species is of most value cut when the seed is ripe. It and P. annua are almost the only grasses that will thrive in grass plats in towns and small confined situations.

P. angustifolia is a valuable grass for permanent pasture, being of rapid and early growth; but the stalks and leaves being subject to the rust, it is obviously unfit for hay. P. pratensis assumes a beautiful verdure very early in spring, but as it sends up flower-stalks only once in a season, it is less adapted for hay than for early and permanent pasture. Cultivated by itself, it becomes so much matted by its creeping roots as to be unproductive, unless on water meadows, for which it is one of the best of grasses. P. annua is a diminutive plant, the most common in all temperate climates, and perhaps in the world. P. sudetica is a tall aquatic. P glauca is ornamental from its glaucous hue. P maritima Sir H Davy found to be one of the best grasses for producing latter-math. P. fertilis (P serotina) ranks as one of the most valuable of grasses. According to the Woburn experiments it produces the greatest abundance of early foliage next to P angustifolia. It prefers a clayey soil, and flowers late.

History, Use, Propagation, Culture,

P. abyssinica is grown as a bread-corn in Abyssinia, and furnishes the *teff* bread, that made from wheat being used only by the superior ranks The dough is allowed to turn sour, and by generating carbonic acid gas, answers instead of yeast; it is then baked into circular cakes, which are white, spongy, of a hot disagreeable sourish taste, but light of digestion The same bread, well toasted, and infused in water for some days, furnishes the *bouza* or common beer of the country, like the quas (*sour*, Rus) of Russia.

197. *Eragrostis.* An elegant appellation derived from ἠρος and ἀγρωστις, Love-grass The pretty dancing spikelets are the delight of children, and remembered by men long after many of their other innocent pleasures have ceased to retain their charm. The plants resemble the Briza or quaking-grass.

198. *Megastachya.* From μεγας, large, and στάχυς, a spike, on account of the large panicles of the genus.

199. *Sclerochloa.* Hard-grass (σκληρος, rigid, and χλοη, grass). A genus of hard worthless grasses.

200. *Eleusine.* Eleusis was one of the appellations of Ceres, the goddess of grasses E. coracana, according to Thunberg, is cultivated in Japan for its edible seeds.

1192 Pan. attenuated, Branches very short, Spikel. 3-fl. acute smooth, Leaves short, of the stem distich. sprdg.
1193 Pan. simple contracted linear lanceolate, Spikelets 4-5-fl. Lower glume shortest, Palee eroded at end
1194 Lvs. flat striat rough, Lig short, Branches of pan. quite sim. Spik. obl with distant flor Pal. acute smooth
1195 Pan. branching contr. Spikelets about 5-flow. Spikel. obtuse slenderish obsoletely 5-nerved, Root creeping
1196 Pan one-sided diffuse, Spikel. obl. ovate 5-7-fl. Florets villous at base, Stem oblique compr. Root creeping
1197 Pan attenuate erect, Spikelets ovate 3-flowered, Palee retuse villous at base, Stipule very short
1198 Ligules nearly none, Leaves plaited at base broader and longer than sheath, Panicle elong. Palee nerved
1199 Panicle contracted one-sided, Stem round
1200 Panicle equal diffuse, Spikelets ovate 4-5-fl. Florets villous at base, Stem and bundles of leaves bulbous
1201 Pan. equal at length divar. Branches in seed bent down, Spikel. linear about 5-fl Florets smooth obtuse
1202 Same as Poa distans
1203 Pan. equal diffuse, Spikel lin. 9-15-fl. Florets smooth, Ligule trunc. ciliated, Stem much branched ascend.
1204 Pan spiked, Spikel. 5-fl. ovate, Flor. smooth acute, Inner palee cil. at back, Stem procumb. and lvs. hairy
1205 Pan equal diffuse, Spikelets ovate 5-fl. Florets smooth 7-nerved obtuse, Stem furr. ang. Root somew. creep.
1206 Spikes fingered numerous, Spikelets imbricated 7-flow. Outer glume obtuse 3-nerved rather silky at base

1207 Pan. equal, in fl. contr. in seed diffuse, Low. bran. at base and rami. hairy, Sp. lin. 7-9-fl. Flor. sharpish smth.
1208 Panicle oblong capillary whorled, Florets 6-flowered very minute nodding
1209 Panicle erect, Flower-stalks stiff, Leaves smooth about the mouth of the sheaths

1210 Panicle equal spreading, Lower branches at base and ramifications hairy, Spikelets 15-25-flowered
1211 Panicle spreading, Spikelets 18-flowered linear
1212 Pan distichous one-sided contr hard, Spikelets linear acute 5-11-fl. Florets smooth obsoletely 5-nerved

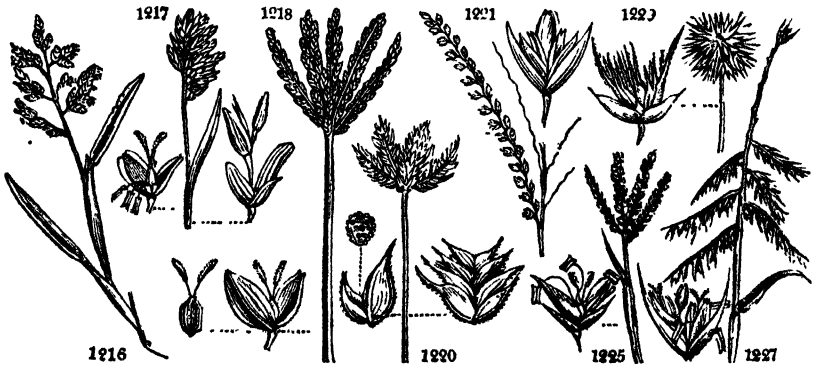
1213 Pan elong. Branc. sprdg. distant abbrev. Spik. lin. 7-11-fl. close press. Flor. smooth acute 3-nerv. Lvs. glauc.
1214 Panicle closely spiked, Spikelets ovate oblong 6-10-flowered, Florets smooth acute, Inner palee fringed

1215 Panicle divaricating, Flower-stalks thickened, Spikelets 4-flowered, Leaves filiform
1216 Panicle lanceolate contracted one-sided rough, Rachis round, Florets obtuse nerved

1217 Panicle one-sided broad contracted stiff, Spikelets lanceolate obtuse 3-5-flowered

1218 Spikes about 7 digitate at length incurv. Rachis membranac. Stem compr. erect, Leaves close together
1219 Spikes digitate erect 5-9 on a linear rachis, Stem compressed declining branching at bottom

1220 Spikes fingered 4-5 obtuse much spreading mucronate, Stem ascending, Leaves opposite



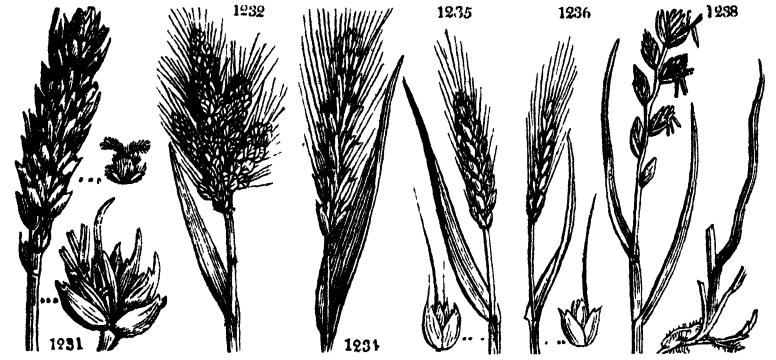
1221 Panicle with simple branches, Flowers sessile 6-flowered, the last sterile, lower bearded
1222 Spike alternate very slender, Spikel. distich. beardless, Leaves rather hairy, Sheaths compressed smooth
1223 Pan. branched fringed, Branches simple, Spikelets 5-fl. subsess Florets all bearded (*Rhabdochloa* P)
1224 Panicle much branched contracted, Branches simple filiform, Spikelets alternate 2-4-flowered beardless

1225 Stolones creeping, Glume much spreading rough, Leaves fringed at edge
1226 All over hoary, Spikes digitate 4, Glume erect, Leaves naked rough at edge

1227 Spikes altern. 1-sided panicled, Glumes equal, Spik. 2-fl. Flor. stalked beardl. herm. Stems prost. Lvs. flat
1228 Spike one-sided simple, Spikelets many-flowered

1229 The only species

1230 Spike paral. compr. bearded, Glumes gibbous bearded trunc. at base contr with a nerve runn. thinner upw
1231 Spike par. compr nearly beardl Glumes gibb. trunc. mucron. at base contr with a nerve runn. thinner upw.



and Miscellaneous Particulars.

201. *Dactyloctenium.* The spikes are digitate, or disposed like one's fingers (δακτυλος, a finger).
202. *Leptochloa* From λεπτος, slender, and χλοη, grass, on account of its heads.
203. *Cynodon* Κυων, κυνος, a dog, and οδους, a tooth, wherefore we know not. Cynodon linearis, the Agrostis linearis of König., is the famous *durva* grass of the Hindoos, for which, see Lambert in the Linn. trans. vii. No 22.
204. *Dinebra.* Its Arabic name.
205. *Echinaria*; εχινος, a hedge-hog: the prickly round heads may be fancied to resemble little hedge-hogs.
206. *Triticum.* According to Varro, was so named from its grain being originally worn down (*tritum*) in making it eatable. This is by far the most important genus of the Gramineæ, as including the wheats, the flour of which is universally allowed to make the best bread in the world. For what is man upon rice or potatoes?

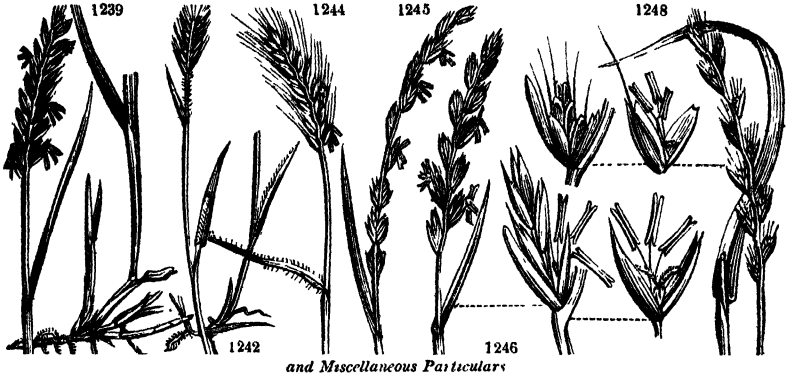
History, Use, Propagation, Culture,

T. æstivum, and the five following sorts, are most probably variations of the same species It is certain that winter-wheat sown in spring will ripen the following summer, though the produce of succeeding generations of spring-sown wheat is found to ripen better. White, red, awned, and beardless wheat change and run into each other on different soils and in different climates, and even the Egyptian wheat is known to change in this country to the single-spiked common plant. There is a sort of summer-wheat apparently a distinct species from those which have been mentioned, the agricultural treatment of which, as well as the general appearance, is similar to that of barley The straw is short and soft, the ears awned, small, and easily threshed, and the grain may be sown in May and reaped in August or September It is very subject to the black disease, and though it has been tried in a number of places has never come into general cultivation A variety from India, called "hill-wheat," and another from the Cape of Good Hope, have also been tried with no better results. But the hill-wheat, and, we believe, the hill-barley, also, of the northern provinces of India has been cultivated with success in Germany, under the direction of the Archduke John of Austria. T monococcum grown in Switzerland, is of similar appearance.



T. spelta appears a distinct species, and more hardy than common wheat, it has a stout straw almost solid, with strong spikes and chaff adhering firmly to the grain The grain is light, yields but little flour, and makes but indifferent bread. It is grown in Switzerland in elevated situations, where common wheat would not ripen also in Bavaria and other parts of Germany It is sown in spring, and ripens in July and August

Of the common wheat there are many varieties, but the most permanent are the red and white grained, and the spring-wheat, which is generally red. The Hertfordshire reds and whites, woolly eared, awned, and nearly fifty other names are merely sub-varieties of the red and white Wheat answers best when treated as a biennial, though it does not remain above one year in the ground Provided the soil be well prepared and dry, and the grain sown in time, the plants do not suffer from the greatest cold of our climate, or even that of Russia. In the latter country, and in the northern counties of Britain, the fields are covered with snow, which retaining a temperature of from 30 to 32 degrees, the plants are found to vegetate and establish their roots firmly in the soil The snow is not thawed off till the weather is decidedly warm in spring, when the plants make rapid progress, apparently more so than in warmer climates Wheat, like all culmiferous plants, may be said to have two distinct sets of roots, the seminal or tap-root, and the coronal or surface-root, the former proceeding from the embryo, and the latter from the first joint of the stem. The former seem intended to nourish the plant while young, to fix it to the soil, and to penetrate into the sub-soil for water, the latter to search along the surface among the lighter materials of the soil for nutritive particles There is in the Banksian museum, a stalk of wheat of ordinary length with a tap-root six feet long, which had penetrated into a sub-soil of limestone brash, and was taken up in digging a drain. It grew on the estate of J Fane, Esq at Wormley in Oxfordshire, in 1818. M. Sageret, a scientific French agriculturist, found that when wheat or any of the other grains were etiolated immediately after germination, by growing too rapidly or being sown too thick, the first joint from which the coronal or surface roots proceed is raised above the ground, and in consequence either throws out no roots at all, or so few as to nourish it imperfectly, in which cases it either dies before it comes into flower, or before the grains are matured. This accurate statement of what takes place, is well calculated to show the bad effects of sowing winter-wheats too early, or spring-corn too late, and grasses in general too thick. Animal substances, and especially bones and urine, are the best manures for wheat, as containing much gluten, a substance found in a greater proportion in that grain than any other Next to animal manures lime is important, as tending to the same effect by chemical combinations Wheat is almost every where cultivated, both in the temperate and torrid zone, to the 45th degree of north latitude, and the height of 200 feet above the level of the sea in southern latitudes

The insects and diseases which attack wheat are various. The grubs of chaffers and beetles, as well as the wire-worm (the larva of different species of Tipula), attack the roots, the wheat-fly (Tipula tritici) the ears; the smut or black the grains; and the mildew, rust, or blight, different names for the same disease, the whole plant. The mildew Sir J Banks determined to be produced by the growth of a minute fungus on the straws and chaff of the plant, and Dr Cartwright (*Phil Mag* Oct 1820) ascertained it might be destroyed by watering with salt and water The smut converts the farinaceous part of the grain into a black powder, and is supposed to be prevented or lessened by steeping the grain previously to sowing in any strong saline mixture. It

1232 Spike compound at the base, Spikelets 5-flowered ventricose imbricated, Terminal floret beardless neuter
1233 Spikelets 4-flowered ventricose pubescent imbricated bearded, Terminal floret barren, Glumes obtuse
1234 Spikelets 4-flowered ventricose roughish, Two middle florets sterile, Palæ unequal outer fringed
1235 Spikelets 3-flowered ventricose roughish, Intermediate floret barren, Glumes ovate
1236 Spikel. 2-fl. ventr imbr. bearded, Barren floret with a short, fertile with a very long beard, Glumes 3-toothed
1237 Spike distich Spikelets 4-flowered approxim Two middle florets sterile, Glumes lin. lanc Stem ascending
1238 Glumes 9-nerved obtuse 4-5-flowered, Florets beardless, Rachis smooth, Root creeping
1239 Root creeping white jointed proliferous
1240 Glumes shortly bearded 3-nerved 5-flowered, Florets bearded, Root fibrous
1241 Spike interrupted, Rachis hispid, Leaves rolled in at edge, Root creeping
1242 Glumes 4-flowered bearded, Spikes lanceolate imbricated, Stems pubescent
1243 Spikelets 4-flowered remote, Two joints of the hairy rachis longer than the spikelet
1244 Spikelets 3-flowered, Ribs of glumes fringed in tufts, Leaves downy
1245 Spikelets lanceolate 8-flowered beardless, Glumes truncate naked, Leaves nerved

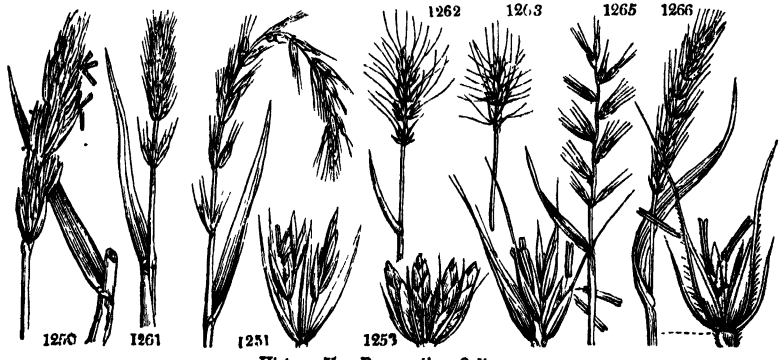
1246 Spike beardless, Spikelets longer than glume
1247 Culm slender, Leaves narrow, Spikelets 3-4-flowered
1248 Spike bearded, Spikelets less than glume, Culm rough upwards
1249 Spike nearly beardless, Spikelets as long as calyx

and Miscellaneous Particulars

is not easy, however, to cure diseases in the vegetable kingdom, and therefore the grand objects of the cultivator ought to be to procure healthy seed, and apply judicious culture

The uses of wheat are well known The grain yields a greater proportion of flour than every other, for, while 14lbs of barley yield 12lbs of flour, and of oats 8lbs, the same quantity of wheat yields 13lbs It is also more nutritive, 1000 parts of barley yielding 920, of oats 743, and wheat 955 soluble parts Of these, the gluten of wheat is 90, of barley 60, and of oats 87 (*Davy Ag Chem* 158) Gluten is so essential an ingredient in bread that the pannary fermentation cannot go on without it, and hence the inferiority of that article in wet seasons, when wheat is blighted or ill ripened, and the advantage of having a stock of old grain, or of grain from the south of Europe, especially of the Mediterranean isles and coasts

Wheat starch is made from wheat, by steeping it, and afterwards beating it in hempen bags. The mucilage being thus mixed with the water produces the acetous fermentation, and the weak acid thus formed, renders the mucilage white After settling, the precipitate is repeatedly washed, and then put in square cakes In drying, the cakes separate into flakes as found in the shops Starch is soluble in hot water, but not in cold, and hence, ground down, it makes an excellent hair powder Its constituents are carbon 43 55, oxygen 49 68, hydrogen 6 77 = 100.



The straw of wheat, from dry chalky lands, is manufactured into hats, for which purpose the middle part of the tube above the last joint is taken, and being cut into lengths of 8 or 10 inches, these pieces being split are used to form the plait The operation of plaiting is performed by females and children, who plait it into ribbons of from one to two inches broad, and these are afterwards sown together on blocks or moulds, beginning at the crown, in various shapes according to fancy or fashion The best straw is produced on the chalky soil about Dunstable, where plaiting is a common occupation Other grasses afford culms which have also been used and manufactured into much finer and expensive work that those of wheat or rye. Leghorn hats are made from the straw of a bearded variety of wheat not unlike rye It is grown on poor sandy soils on the banks of the Arno, between Leghorn and Florence, expressly for this manufacture. It does not grow above 18 inches in length, is pulled green, and bleached like flax on the gravelly bed of the river The straws are not split as in England, which renders the plait tougher and more durable. The value of wheat-straw for thatching, litter, and other purposes, need not be mentioned

T. junceum grows in loose sand on the sea-coast, and by its tough creeping roots and numerous fibres cooperates with Carex arenaria, Elymus arenarius, and Festuca rubra, in keeping them stationary, accumulating more, and eventually rendering drifting sands fit for agricultural purposes.

T. repens, couch, white couch, twitch, dog-grass, quickens, &c is common in most parts of Europe, and even in Siberia It is one of the worst weeds in arable lands and gardens, and in the former is only to be destroyed by fallowing or fallow crops, or laying down to grass, and the latter by hand-picking or very deep trenching The roots are sweet and nourishing, and are greedily eaten by horses and cattle. Sir H Davy found them to contain nearly three times the nourishment of the stalks and leaves.

207. *Lolium* Loloa is the Celtic name of this grass L. perenne is the *fausse ivraie* (see L. temulentum) of the French, from which our term ray-grass is derived, the *Dawcrende Loich*, Ger., and *Loglio vivace*, Ital This appears to be the first grass which was taken into cultivation in Europe, but when is uncertain Gerarde, Parkinson, Plattes, and even Blythe in Cromwell's time, take no notice of it. It is first mentioned by Dr. Plott in 1677. "They have lately sown," he says "ray-grass, Gramen loliaceum, to improve cold sour clayey weeping ground unfit for saint-foin." It was first sown in the Chiltern parts of Oxfordshire, and afterwards by one Eustace at Islip in the same county There are two varieties of this grass, the perennial, which is of shorter growth than the other, and on sound dry soils will last four or five years, and on rich soils longer; and the annual, or rather biennial, which is tall and larger in all its parts than the perennial, and after producing one bulky crop dies at the root, or, at least, sends up no latter math After all that has been affirmed of other grasses, none appear so well adapted as the annual rye-grass for producing a bulky crop of hay, with or without red clover, or better adapted than the perennial variety for sowing down with white clover, to afford three or more years pasture in the rotations of what is called convertible husbandry, or the alternate corn and grass culture Cock's-foot grass and woolly grass (Holcus) may afford a greater bulk on poor soils, but are far inferior to the ray-grass in regard to nutritive qualities Sir H Davy found the value which

History, Use, Propagation, Culture,

this grass cut at the time it is coming into flower bears to that when the seed is ripe, to be as 10 to 11. Pacey's perennial ray-grass, a variety raised in Staffordshire, has long been in repute, and there has lately been a new variety raised in Bedfordshire, known as the Russel ray-grass

208. *Elymus* Linnæus derives the name from ὑλέω, to cover, because the leaves of his Elymus maritimus are formed into a coarse sort of fabric The Elymus of the ancients was evidently a sort of corn E. arenarius is a strong rough glaucous plant common on sandy shores, and like Calamagrostis arenaria and others, which have been mentioned (genus Lygeum, Stipa, Arundo), prevents, by its matted roots, the shifting of loose sand thrown up by the tides In analyzing the soluble matter afforded by this grass, Sir H. Davy found it to contain more than one-third of its weight of sugar. It is not, however, eaten by any of our domestic animals.

209. *Secale* An ancient name, supposed to have been derived from *seco*, to cut, which word is said to have been formed from the Celtic *segu*, a sickle This grain, of which there is probably only one species, affords a grain next in value to the wheat for making bread, and is generally used for this purpose, alone or mixed with wheat, throughout Germany and the north of Europe It is hardier and earlier than wheat. Like it, it will ripen if sown in spring, but better if treated like a winter-wheat. In Britain it is little sown Its grain yields 792-1000 parts of soluble matter, of which 645 are mucilage, 190 gluten, and 38 sugar.

210 *Hordeum.* Bodæus à Stapel derives this word from *hordus*, heavy, because bread made with barley is very heavy *Bara* is the Celtic for bread, whence the English words barn and barley; as beer is a slight alteration of the appellation of barley in that tongue, *Bere* *Hexastichon* (ἑξ, six, στιξ στιχος, row) signifies grain growing in six rows, *distichon*, in two rows *Zeocriton* is derived from ζεα, which is supposed to have been Spelt, and κριθη, barley that is to say, barley resembling spelt wheat. The four first species, or, more probably, sub-species, are cultivated as barleys H vulgare or two rowed barley, is that in general cultivation, and of this the rath-ripe and Thanet are preferred as varieties H hexastichon is the bear or bigg chiefly cultivated in the north of Scotland, and in Denmark and Sweden H distichon has thin husks, and is preferred for malting. H zeocriton or sprat barley has short broad ears, long awns, and short coarse straw, and is not much cultivated. The native country of barley is unknown It was cultivated by the Romans as a horse-corn, and also for the army, and the gladiators were called Hordiarii from their feeding on this grain In the south of Europe they have sometimes two crops in one season, one sown in autumn and cut in May, and another

1250 Spike erect close, Spikel. 3-fl pubesc. Lower and upper in pairs middle in 3s rather shorter than fring. glume
1251 Spike loose erect, Spikel. 3-fl. pubesc lower remote shorter than the smooth glumes, Leaves involute rigid

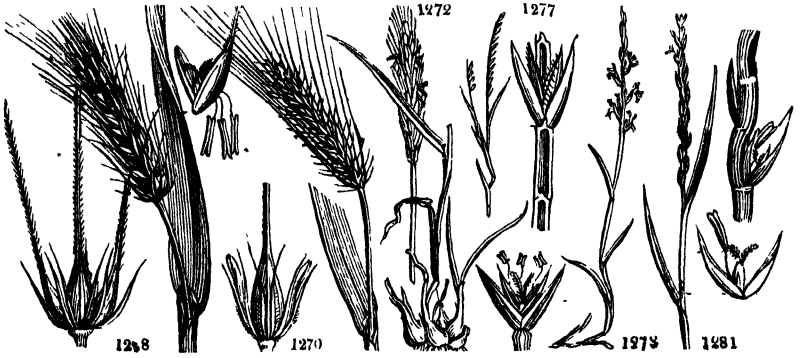
1260 Spike erect, Spikel 3-fl villous bearded in threes, Glumes bearded longer than spikel Leaves flat
1261 Spike erect, Spikel. in 3s 1-2-fl. bearded rough, Glms. linear subul. bearded as long as spikel Sheaths hairy, [Leaves flat
1262 Spikelets 1-fl. rough, Involucres erect
1263 Spikelets 2-fl Involucres setaceous spreading
1264 Lvs. short involute curved, Spike erect rough, Spikel. in 3s 2-fl longer than the bearded very narrow invol
1265 Spike erect, Spikelets spreading, Involucr none [Outer glume with a short beard



1266 Glumes and beard rough, Paleæ smooth toothed at the end
1267 Stem procumbent at base, Uppermost leafsheath tumid, Glumes and paleæ subulate bearded

1268 All florets hermaphrodite bearded, Seeds in 4 rows, Stems erect
1269 All florets hermaphrodite bearded, Seeds in 6 rows
1270 Lateral florets male beardless hermaphrodite in 2 rows bearded
1271 Lateral florets male beardless hermaphrodite in 2 rows, Spike short, Seeds angular spreading
1272 All florets fertile in threes bearded, Involucres setaceous ciliated at base
1273 Intermediate glumes linear lanceolate ciliated outer setaceous rough
1274 Lateral florets male with a short beard, All the glumes setaceous rough
1275 All the glumes rough, Inner glume of the lateral florets semi-lanceolate the rest setaceous
1276 Beards and involucres setaceous very long

1277 The only species

1278 Spike slender subulate incurved
1279 Spike subulate somewhat compressed erect, Leaves channelled
1280 Spike subulate erect, Leaves flat

1281 Spike subulate erect, Glume minute, Florets bearded
1282 Spike subulate erect, Glume ensiform acuminate appressed

and Miscellaneous Particulars

sown in spring and cut in autumn In Lapland two months, and in England nine weeks elapse between the sowing and cutting of this grain

Malt is the chief purpose for which barley is cultivated in Britain, but it is also made into flour, and pot and pearl barley In order to understand the process of malting, it may be necessary to observe, that the cotyledons of a seed before a young plant is produced, are changed by the heat and moisture of the earth into sugar and mucilage Malting is only an artificial mode of effecting this object, by steeping the grain in water, and fermenting it in heaps, and then arresting its progress towards forming a plant by kiln drying, in order to take advantage of the sugar in distillation for spirit, or fermentation for beer The chemical constituents of mucilage and sugar are very nearly alike in the process of malting a part of the mucilage or starch is converted into sugar, so that the total quantity of sugar, and consequently the source of spirit, is increased.

Of pot-barley there are two sorts, pearl and Scotch, both produced by grinding off the husk, and the former variety by carrying the operation so far as to produce roundness in the kernel It is used in soups, gruels, and medicinal drinks

Barley-flour is ground like flour, and forms a light pudding or pottage, which, spread out in thin cakes and slightly toasted, forms a breakfast bread much esteemed in some parts of Scotland It is brought to table hot from the baking plate, and eaten with butter and honey, or cream and sugar.

H. murinum, squirrel-tail-grass, is common by way-sides, and its awns or heads are so injurious to the gums of horses in the isle of Thanet, that one of the greatest recommendations of an inn is having "hay without any mixture of squirrel-grass"

H pratense resembles rye, and to this, Professor Martyn observes, the name of rye-grass belongs, and not to Lolium perenne, which is ray (from *ivraye*, Fr) grass.

211. *Microchloa* From *μικρος*, small, *χλοη*, grass, on account of its size.

212. *Ophiurus*. A name constructed by Gærtner from *ὀφις*, a snake, and *ὐρα*, a tail, from a fancied resemblance in the spikes of the genus to the tail of a viper This is the genus Rottbollia of English botanists. but no true species of that genus have yet been cultivated in this country

213 *Monerma* From *μονος*, one, and *ἐρμα*, support, there is only one glume, which by its rigidity acts as a support to the flower.

History, Use, Propagation, Culture,

214 *Perotis* From περος, deficient, some parts of the flower being absent.

215 *Saccharum* From its Arabic name *soukar*, from which the Greeks formed σακχαρ, and modern European nations sugar *Sucre*, Fr *Sucker*, Ger, &c This grass or reed, though unknown to the ancients, has become of immense importance in modern times There are many varieties or species both wild and cultivated, natives of the banks of rivers and meadows in both the Indies, China, Africa, the South Sea islands, and South America It is cultivated in a zone extending from 35 to 40 degrees on each side of the equator Where it was first cultivated is unknown, in all probability, in India, for the Venetians imported it from thence by the Red Sea prior to 1148 It is supposed to have been introduced into the islands of Sicily, Crete, Rhodes, and Cyprus by the Saracens, as abundance of sugar was made in these islands previously to the discovery of the West Indies in 1492 by the Spaniards, and the East Indies and Brazil by the Portuguese in 1497 and 1500. It was cultivated afterwards in Spain, in Valentia, Granada, and Murcia by the Moors, and sugar is still made in these provinces (*Townsend and Jacob*) In the 15th century the cane was introduced to the Canary islands by the Spaniards, and to Madeira by the Portuguese, and thence to the West India islands and the Brazils The Dutch began to make sugar in the island of St Thomas, under the line, in 1610, and the English in Barbadoes in 1643, and in Jamaica in 1644 The culture of the cane has since become general in warm climates, and the use of sugar being universal, it forms one of the first articles of commerce throughout the world Sugar is described by Pliny and Galen as a sweet salt, and from the former it appears to have been used only in medicine. Actuarius, a physician, who wrote in the 10th century, or later, was the first to substitute sugar for honey in medicinal compositions It was called Indian salt, and a small piece was recommended to be kept in the mouth to moisten it in fevers Different medical men have written for and against the use of sugar, as they have against tea, coffee, wine, and all with similar success The enjoyment derived from these articles to all mankind who enjoy them, is too great to be left off in deference to the opinions of a few. Dr. Mosely is the greatest advocate for sugar For the last two centuries it has been an ingredient in the popular diet of Europe It was in use in England in 1466, but chiefly in feasts and as a medicine, till it was brought from the Brazils about 1580 to Portugal, and imported from thence The quantity consumed in Britain has always kept increasing, the consumption of England alone in 1790 amounted to 166,573,344lbs., which, taking the population at eight millions, gives each individual at an average about 20lbs a-year

The cane, as a stove plant, is of easy culture in soft moist soil with a good heat, it grows seven or eight feet high, but it never flowers It was grown in abundance in the stoves of the Paris gardens, and a small sugar loaf was made from the canes, and presented to the Empress Josephine. In the botanic gardens of Toulon and Naples it stands the winter in the open air

The cane in the West Indies is propagated by cuttings from the root end, planted in hills or trenches in spring or autumn, something in the manner of hops The cuttings root at the joints under ground, and from those above send up shoots, which in eight, twelve, or fourteen months are from six to ten feet long, and fit to cut down for the mill. A plantation lasts from six to ten years. Sugar mills are merely iron rollers placed vertically or horizontally, between which the canes are passed and repassed The juice thus squeezed out, is collected and boiled with quick-lime, which being an alkali, imbibes the superfluous acid, which would otherwise impede crystallization · impurities are skimmed off, and the boiling is continued till a thick syrup is pro-

1283 Culm simple, Leaves very smooth, Joints smooth

1284 Flowers panicled, Leaves flat

1285 Pan. spiked cylindrical, Leaves convolute, Joints smooth, Flowers generally diandrous

1286 Pan diffuse sheathed, Florets 3-androus spreading, Keel of the glumes fringed
1287 Pan diffuse, Branches horizontally spreading, Florets 3-androus, Keel of the glumes fringed

1293 Leaves ovate lanceolate, Flowers lateral scattered
1294 Leaves linear-lanceolate, Flowers panicled

and Miscellaneous Particulars

duced, when the whole is cooled and granulated in shallow vessels It is now the raw or Muscovado sugar of commerce A further purification is effected by dissolving it in water, boiling, skimming, adding lime, and clarifying from the oily or mucilaginous parts, by adding blood or eggs, which incorporate with them and form a scum When boiled to a proper consistency it is put into unglazed earthen vessels of a conical shape, with a hole at the apex, but placed in an inverted position, and the base, after the sugar is poured in, covered with clay When thus drained of its impurities, it is taken out of the mould, wrapped in paper, and dried or baked in a close oven It is now the loaf sugar of the shops, and according to the number of operations it undergoes, is called single or double refined The operation of refining is seldom or never performed by the growers, but in Europe, at least, generally forms a separate branch in the mother country of the colony

Sugar candy, *Shukur* and *khand*, Indian names for sugar in general, is formed by dissolving loaf sugar in water over a fire, boiling it to a syrup, and then evaporating it to crystallize in a cool place This is the only sugar esteemed in the east

Barley sugar is a syrup from the refuse of sugar candy, hardened in cylindrical moulds

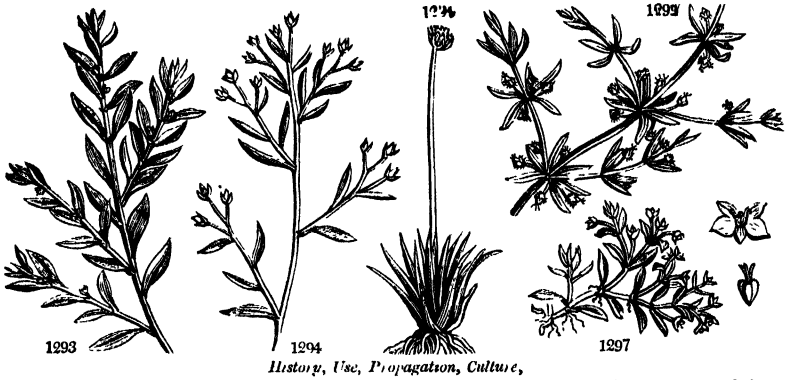
Rum is distilled from the fermented juice of sugar and water

Sugar as a chemical compound is described as a neutral salt, consisting of the acetic acid, united to a small quantity of oil and charcoal, carbonated hydrogen, and carbonic acid gas Besides its use in medicine, dietetics, and distillation, it is employed to preserve animal and vegetable substances from putrefaction, and to communicate a gloss to ink, varnishes, and pigments When very cheap, it has been successfully employed to fatten cattle Most plants contain sugar, and it has been extracted in considerable quantities from the beet, parsnip, maple, birch, grape, &c, but the cane is preferred as affording it in greater abundance

216 *Imperata* The derivation or application of the idea not explained The plants resemble in their *noble* port and waving silky heads the plumes of a cap of state

217 *Lecrsia* Named after J D Leers, an author of the Flora Herbornensis, the first edition of which, in 1789, is very valuable on account of its rarity but its merits have been extolled much beyond reality by Sir James Smith One species, L. lenticularis, which has not yet been introduced to this country, has the power of catching flies by the singular structure of its corolla, which resembles the leaves of Dionæa muscipula

218 *Diarrhena* A word signifying diandrous, *δις*, two, *ἀνήρ*, male



219 *Arundinaria.* An alteration of the word Arundo, to which genus this may be compared with reference to its large size

220 *Holosteum* A name derived from *ὁλος*, all, and *οστ ον*, bone, all-bone, and applied by antiphrasis to this plant, which is no-bone, being very soft and delicate The plant is very common in many parts of Britain, by road sides, where protected by hedges; it flowers early in the season, and keeps flowering for a long time. In coppice woods on loamy soils it grows with the greatest luxuriance, and, along with the yellow primrose, and the purple wild hyacinth, forms a most ornamental clothing to the earth in the end of April and beginning of May.

221. *Polycarpon.* From *πολυς*, many, *καρπος*, fruit, all-seed, one of the names applied by the ancients to the Polygonum aviculare, and sufficiently applicable to this plant.

232. *Lechea.* In memory of G Lechea, a Swede, professor of natural history at Abo, and author of observations on rare plants, died in 1764 The genus consists of small N American plants of no beauty

History, Use, Propagation, Culture,

223 *Eriocaulon* Ἔριον, wool, and καυλος, a stem, in allusion to the velvety stem of some species. Only one kind, E. septangulare, has been found in Britain The species are all very curious, and deserving of more attention than they have received at the hands of cultivators

224 *Montia* In honor of Joseph de Monti, professor of botany and natural history at Bologna in the beginning of the 18th century The plants are small inconspicuous weeds

225. *Mollugo* The Roman name of what is supposed to be our Galium mollugo, which the present plant resembles in its whorled leaves and inconspicuous appearance

CLASS IV. — TETRANDRIA. 4 STAMENS.

THIS class is neither so large nor so important as the last. It is composed chiefly of ornamental or curious plants, mostly shrubs, of which the Proteaceæ hold the first rank Among the few plants used in the arts which it contains, may be mentioned the madder (Rubia), Fuller's thistle (Dipsacus), the holly (Ilex), one of the best evergreen hedge plants, and some foreign timbers and dyes, as the sandal-wood and chayroot.

The Proteaceæ, of which the first section of the class partly consists, are natives chiefly of the Cape of Good Hope and New South Wales, and there is this singular circumstance connected with their geographical distribution, that those two continents do not possess any one genus in common; a singular fact, and of the more difficult solution, as the genera of the order are strictly natural They have been described by Mr. Brown, in a long and learned memoir, in the Transactions of the Linnean Society, vol x, where much information respecting them may be found It has been impossible to state the natural height or color of flower of many of the New Holland kinds, as Mr Brown says nothing upon these two points, and he is the only author who has seen the plants in their native country, where alone many of them have flowered. In the conservatory they are mostly shrubs of from four to seven feet in height.

The principal part of the fourth section of Monogynia consists of the Stellatæ or Crossworts, which are common weeds all over Europe

Many of the genera in the sixth section, such as Ixora, Pavetta, Catesbæa, are beautiful ornaments of the conservatory The wood of Curtisia in the seventh section furnishes the Caffres with materials for the shafts of their hassagays.

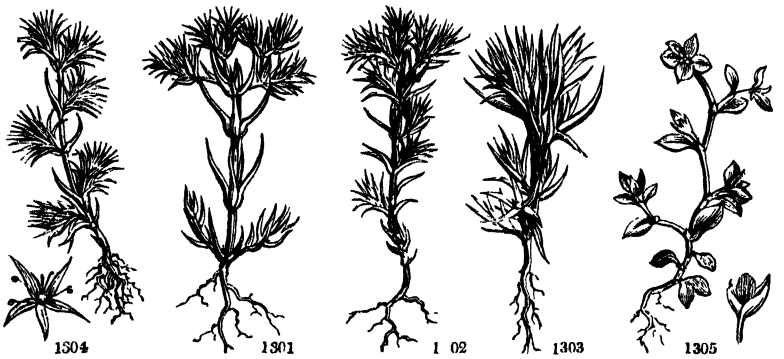
With the exception of Proteaceæ, the class is made up of a miscellaneous assemblage of species, with few characters in common. The genera have not been combined in any other than a purely artificial manner, and among them are to be found plants belonging to almost all the natural orders of Dicotyledonous plants of the older French botanists. Pothos, Potamogeton, and Ruppia are among the rare instances of a quaternary division of the flower in Monocotyledonous plants

Order 1 MONOGYNIA.  4 Stamens. 1 Style.

1. *Flowers incomplete, (no corolla), inferior.*

229. *Petrophila.* **Cal. 4-cleft, all deciduous Style persistent at base Stigma spindle-shaped, narrowed at end. Scales beneath the ovary none Cone ovate Nut lenticular, comose at one end.**

1295 Stem 7-angled, Leaves acuminate cellular, Male fl. monopetalous tetrandrous
1296 Stem 7-angled, Leaves flat hairy much shorter than the stem, Scales of the head powdery



1297 Stem erect divaricating, Leaves connate-sessile oblong ovate
1298 Stem weak dichotomous, Leaves opp sessile obtuse lanceolate fleshy

1299 Leaves whorled wedge-shaped acute, Stem divided decumbent, Pedunc. 1-flowered
1300 Stem erect, Leaves whorled three larger than the rest, Pan. terminal and lateral

1301 Leaves filiform dilated at base, Branches terminal capitate corymbose, Flowers axillary
1302 Leaves capillary, Flowers terminal stalked alternate longer than bracteæ
1303 Leaves capillary, Corymbs leafy axillary stalked, Flowers shorter than bracteæ

1304 Leaves opposite filiform, Flowers terminal heaped, Bracteæ squarrose

1305 The only species

and Miscellaneous Particulars

226. *Menuartia* In memory of John Minuart, a Spanish botanist, and correspondent of Linnæus. He published some Opuscula in 1739.

227 *Quersa.* In memory of Joseph Quer, a Spanish botanist, who published a *Flor Espagnol* in 1762, in six volumes, quarto.

228 *Kœnigia* In honor of Emanuel Kœnig, professor of botany at Bale, and called the modern Avicenna, he died in 1731. He published several works now forgotten The plant is a curious inconspicuous annual, occasionally seen in botanic gardens

230 *Isopogon* Cal 4-cleft, with a slender tube, persistent for a long time Style wholly deciduous Stigma spindle-shaped or cylindrical. Scales beneath the ovary none Nut sessile, ventricose, comose on all sides

231 *Protea* Cal bipartible, unequal, with the stamen-bearing divisions of the broader lip cohering. Style subulate Stigma narrowly cylindrical Nut bearded on all sides, with the remains of the persistent style Common receptacle with short persistent scales Involucrum imbricated, persistent.

232 *Leucospermum.* Cal irregular, labiate, with three of the segments (rarely all) cohering at the base, the stamen-bearing divisions distinct. Style filiform, deciduous Stigma thickened, smooth, sometimes unequal-sided. Nut ventricose, sessile, smooth Head indefinitely many-flowered Involucrum many-leaved, imbricated

233. *Mimetes.* Cal. 4-parted, equal, with distinct divisions Style filiform, deciduous. Stigma cylindrical, slender. Nut ventricose, sessile, smooth Common receptacle flat, with narrow deciduous scales. Involucrum indefinitely many-leaved, imbricated.

234 *Serrurra.* Cal. 4-cleft, nearly equal, with distinct claws Stigma vertical, smooth. Scales 4, hypogynous. Nut shortly stalked, ventricose Head indefinitely many-flowered, with persistent imbricated scales.

235 *Nivenia* Cal. 4-cleft, equal, wholly deciduous Stigma clavate, vertical Nut ventricose, shining, sessile, entire at the base Involucrum 4-leaved in a simple series, 4-flowered, when in fruit indurated. Receptacle flat, without scales.

236 *Sorocephalus.* Cal 4-cleft, equal, wholly deciduous Stigma vertical, clavate. Nut ventricose on a very short stalk, or emarginate at base Involucrum 3-6-leaved in a simple series, definitely few-flowered or 1-flowered, in fruit not altered. Recept. without scales

237. *Spatalla.* Cal. 4-cleft, wholly deciduous, the inner segment usually largest. Stigma oblique, dilated. Nut ventricose on a short stalk Involucrum 2-4-leaved in a simple series, 1-flowered, or definitely many flowered. Recept. without scales.

238. *Persoonia.* Cal. 4-leaved, regular, the segments having the stamens in their middle, recurved at end, and deciduous. Stamens exserted. Glands 4, hypogynous. Ovary stalked, 1-celled, 1-2-seeded. Stigma obtuse. Drupe berried, with a 1-2-celled nut.

239. *Grevillea* Cal irregular, with the segments 1-sided, bearing the stamens in their hollow ends Anthers immersed. Gland 1, hypogynous, halved. Ovary 2-seeded. Stigma oblique, depressed (sometimes nearly vertical and conical). Follicle 1-celled, 2-seeded, with a cell in the middle Seeds edged, or with a very short wing at the end.

240. *Hakea* Cal 4-leaved, irregular, with the segments on one side. Stamens immersed in the concave ends of the calyx. Gland 1, hypogynous, halved. Ovary stalked, 2-seeded. Stigma nearly oblique, with a conical point from a dilated base. Follicle 1-celled, woody, with a cell out of the centre, falsely 2-valved. Seed with a wing at the end longer than the nut.

241 *Stenocarpus* Cal. irregular, segments distinct, at one side Stamens immersed in the concave ends of the cal Gland 1, hypogynous, half-annular. Ovary stalked, many-seeded Style deciduous Stigma oblique, orbicular, flattened. Follicle linear. Seeds winged at base

242. *Lambertia.* Cal. tubular, 4-cleft, the segments spirally revolute Stamens inserted in the segments.

Scales 4, hypogynous, distinct or united in a sheath. Ovary 2-seeded. Stigma subulate. Follicle 1-celled, coriaceous Seeds emarginate Involucrum 1-7-flowered, imbricated, deciduous. Receptacle flat, without chaff.

243. *Xylomelum.* Cal. 4-leaved, regular, the segments revolute at the end. Stam inserted above the middle of the segments Glands 4, hypogynous Ovary 2-seeded Style deciduous Stigma vertical, clavate, obtuse. Follicle thick, woody, 1-celled, the cell out of the centre. Seeds winged at end.

244 *Telopea* Cal. irregular, on one side irregularly divided, on the other 4-toothed Stam immersed in the concave ends of the calyx Gland none Ovary stalked, many-seeded. Stigma oblique, orbicular, dilated. Follicle cylindrical. Seeds winged at end Involucrum none

245 *Lomatia* Calyx irregular, with distinct 1-sided segments Stamens immersed in the concave ends of the calyx. Glands 3, hypogynous on one side Ovary stalked, many-seeded Style persistent Stigma oblique, dilated, roundish, flat Follicle oval. Seeds winged at ends

246 *Rhopala* Cal 4-leaved, regular, segments recurved at end. Stamens inserted above the middle of the segments Scales 4, hypogynous, distinct or connate Ovary 2-seeded. Style persistent. Stigma vertical, clavate Follicle 1-celled, woody Seeds winged at both ends.

247 *Banksia* Cal 4-parted Stamens immersed in the concave ends of the segments Scales 4, hypogynous. Ovary 2-celled, with 1-seeded cells Follicle 2-celled, woody. Dissepiment loose, bifid.

248 *Dryandra* Cal. 4-parted or 4-cleft. Stamens immersed in the concave ends of the segments. Scales 4, hypogynous Ovary 2-celled, with 1-seeded cells Follicle 2-celled, woody, with a loose bifid dissepiment. Common receptacle flat

249 *Struthiola* Cal tubular, having 8 glands at the mouth. Berry without juice, 1-seeded

250 *Operularia* Common calyx 1-leaved, campanulate, 3-6-flowered, 6-9-toothed, proper none. Seeds solitary, immersed in a closing receptacle, which is operuliform, deciduous

251 *Cryptospermum* Common calyx 6-leaved leaflets spreading, unequal, proper, 3-leaved from the chaff of the receptacle Recept globose, chaffy Capsules 1-celled, united into a sub-globose receptacle, opening lengthwise in the middle

252 *Pothos* Spathe 1-leaved. Spadix cylindrical, simple, covered with flowers. Cal. 4-leaved. Stamens next the ovary Berry 2-seeded

253 *Rivina* Cal 4-leaved, persistent Berry 1-seeded, with a lentiform rough seed

254 *Camphorosma* Calyx urceolate, with two opposite and alternate teeth very small Caps. 1-seeded. Stamens exserted.

255 *Alchemilla* Cal 8-cleft, the alternate segments smallest Style from the base of the ovary. Seed 1, naked, covered with the calyx

256 *Sanguisorba* Cal coloured, 4-lobed, with 2 scales at the base Caps 4-cornered, enclosed in the calyx, 1-2-celled

257 *Dorstenia* Common receptacle 1-leaved, fleshy, dilated, spreading, orbicular, or angular, in which the solitary seeds nestle.

2 *Flowers incomplete, superior*

258 *Isnarda* Cal campanulate, adhering to the ovary, 4-cleft Caps 4-celled, surrounded by the calyx, 4-cornered, many-seeded

259 *Elæagnus* Cal 4-8-cleft, campanulate on the outside rugose, inside colored, deciduous Filaments very short between the segments of the calyx Style short. Drupe ovate, with an oblong 1-seeded nut.

3 *Flowers monopetalous, 1-seeded or dicoccous, inferior*

260 *Globularia* Common calyx imbricated proper tubular, 5-toothed Cor with the upper lip 2-, the lower 3-parted Seed 1, enclosed in the calyx Recept chaffy

261. *Houstonia* Cal 5-toothed. Cor tubular Caps 2-celled, 2-valved, 2-seeded

4 *Flowers monopetalous, 1-seeded or dicoccous, superior*

DIPSACEÆ.

* 262. *Dipsacus* Common calyx many-leaved, proper superior. Cor tubular, 4-cleft. Seed 1, crowned by the calyx Recept conical, chaffy Pappus cross-shaped, entire

263 *Cephalaria* Common calyx sub-globose, with scales more or less scarious, proper double, pappus-shaped, variously split Receptacle chaffy

264 *Scabiosa* Common calyx many-leaved, proper double pappus-shaped, variously split. Receptacle chaffy

265 *Knautia* Common cal many-leaved, cylindrical, oblong, simple, 5-flowered, proper simple, superior Corolla irregular Seed 1, crowned by the calyx. Receptacle naked.

STELLATÆ.

266 *Galium* Cal an obsolete superior edge Cor rotate Seeds 2, globose

267 *Rubia* Cal an obsolete superior edge Cor rotate, sub-campanulate Berries 2, 1-seeded Stam 4-5

268. *Asperula.* Cal an obsolete edge, 4-toothed Cor. monopetalous, funnel-form. Seeds 2, globose, not crowned by the calyx

269 *Sherardia* Cal a 4-toothed edge Cor monopetalous, funnel-form Seeds 2, 3-toothed, crowned by the persistent calyx

270 *Spermacoce* Cal a 4-toothed edge Cor monopetalous, funnel-form Caps 2-celled, not divisible in two, with 2 cells, 2-toothed. Seeds with their edge rolled together over their side

271 *Crucianella* Cal. 2-3-leaved. Cor monopetalous, funnel-form, with a filiform tube and an unguiculate limb. Seeds 2, linear

5 *Flowers monopetalous, many-seeded, inferior.*

272. *Callicarpa* Calyx 4-toothed. Corolla tubular, campanulate, 4-cleft Stamens exserted Berry 4-seeded.

273 *Witheringia* Cor sub-campanulate, with a tube having 4 projections Cal. very small, obsoletely 4-toothed. Pericarp 2-celled, berried Anthers conniving, opening laterally

274 *Egsphila* Cal. 4-toothed Cor 4-cleft Style semi-bifid, filiform Berry 2-celled. Cells 2-seeded

275 *Cephalanthus* Common cal. none, proper, as well as corolla, 4-toothed, tubular funnel-form. Receptacle globose Caps 2-4-celled, not splitting Seeds solitary by abortion, oblong

276. *Scoparia* Cal 4-parted, equal. Cor 4-parted, rotate, with a hairy throat, regular Stamens equal. Stigma obtuse. Capsule nearly round, 2-celled, 2-valved, with a dissepiment from the inflexed margins of the valves.

277 *Centunculus* Cal 4-cleft. Cor 4-cleft, tubular, with a spreading limb Stamens short. Caps. 2-celled, cut round, many-seeded.

278 *Plantago.* Cal. 4-cleft. Cor quadrifid, with a reflexed limb Stamens very long. Caps. 2-celled, cut round.

279 *Buddlea* Calyx and corolla 4-cleft Stamens from the incisures Caps 2-furrowed, 2-celled, many-seeded.

280. *Exacum.* Cal 4-leaved Cor somewhat bell-shaped, 4-cleft, with a globose tube. Caps. compressed, 2-furrowed, 2-celled, many-seeded, splitting at the end

281. *Sebæa.* Cal 4-5-parted, the sepals keeled or winged Cor 4-5-cleft, withering Stamens exserted,

the anthers bursting lengthwise after flowering with a recurved callus at the end. Stigmas 2. Caps. with the valves inflexed at the edge, inserted in a central placenta, which finally becomes loose

282 *Frasera.* Cal. deeply 4-parted, spreading Cor much larger than the calyx, very deeply 4-parted, spreading, the segments oval, bearded with a gland in the middle Stamens shorter than corolla, with anthers 2-divided at the base. Stigmas 2, thick, glandular. Caps. oval, much compressed, 1-celled, 2-valved at the edge Seeds 8-12, elliptical, with a membranous edge

283. *Penæa.* Cal. 2-leaved deciduous. Cor. campanulate. Style quadrangular. Stigma 4-lobed. Caps 4-cornered, 4-valved, 8-seeded.

284 *Blæria.* Calyx 4-parted. Corolla 4-cleft, somewhat campanulate. Seeds inserted into a receptacle Caps. 4-celled, many-seeded, opening at the angles.

6. *Flowers monopetalous, 2 or many-seeded, superior.*

285 *Chomelia* Cal. 4-parted, tubular, with unequal segments. Cor. hypocrateriform, 4-parted Drupe oval, inferior, with a 2-celled, 2-seeded nut. Stigmas 2, thickish.

286. *Adina.* Cal. 4-5-cleft, with an occasional toothlet between the divisions Corolla infundibular Filaments inserted into the mouth of corolla. Stigma turbinate Seeds 2-3 in each cell. Flowers in heads.

287. *Bouvardia.* Cal. 4-leaved, with some teeth between Corolla tubular Anthers included. Caps 2-partible, many-seeded Seeds edged

288. *Ixora.* Cal. 4-parted. Cor monopetalous, funnel-shaped, long Stamens above the throat Berry 4-seeded

289 *Catesbæa* Cal. 4-toothed, very small. Cor. funnel-shaped, very long Stamens within the throat. Stigma simple. Berry 2-celled, many-seeded.

290 *Pavetta* Cal. 4-toothed. Cor monopetalous, funnel-form Stigma thickened, incurved. Berry 1-2-seeded, 1-celled

291. *Ernodea.* Cal. 4-parted. Cor hypocrateriform Style simple Berry 2-celled Seeds 2, solitary

292 *Siderodendrum.* Cal. small, 4-toothed Cor hypocrateriform, 4-cleft, with an incurved tube Stigmas 2, revolute Berry 2-coccous, 2-celled, dry, with a contrary dissepiment Seeds 2, solitary

293 *Coccocypsilum.* Cal. 4-parted. Cor funnel-shaped. Berry inflated, 2-celled, many-seeded. Style half 2-cleft.

294 *Mitchella.* Cal. 2, on one ovary, 4-parted Cor funnel-shaped, hairy within Stigmas 4. Berry bifid, 4-seeded

295 *Oldenlandia* Cal. 5-toothed, persistent Cor of 5 petals inserted into the calyx

296. *Manettia* Cal. 8-leaved. Cor quadrifid, tubular. Caps. 2-valved, 1-celled. Seeds imbricated, orbiculate, with a central point.

7 *Flowers polypetalous, inferior*

297. *Epimedium.* Cal. 4-leaved, caducous, opposite the petals. Nectaries 4, cup-shaped, incumbent upon the petals Pod 1-celled, 2-valved, many-seeded

298 *Ptelea* Cal 4-parted. Pet. coriaceous Stigmas 2 Samara roundish with a 1-seeded centre, or 2-celled, 2-seeded

299 *Monetsa.* Cal 4-cleft, urceolate. Pet 4, revolute, linear. Berry 2-celled, with 2-seeded cells, one of which is usually abortive

300 *Curtisia.* Cal 4-parted. Petals 4, obtuse Drupe roundish succulent. Nut 4-5-celled

301. *Hartogia* Cal 4-5-cleft Petals 4, spreading Drupe not juicy, ovate Nut rather fleshy, 2-seeded.

302. *Ammannia* Cal 1-leaved, campanulate, plaited, 8-toothed. Pet. 4, inserted in the calyx, or very often none Caps 2-4-celled, many-seeded

303 *Fagara* Cal. 4-5-cleft. Corolla of 4-5 petals, which are shorter than the stamens. Cal. 2-valved, 1-2-celled, 1-seeded, simple or compound Stam 4-5-8

304 *Zieria.* Cal 4-cleft. Cor of 4 petals Stam 4, smooth, with filaments inserted into a gland. Style simple. Stigma 4-lobed. Caps. 4, connivent. Seeds with an arillus.

8 *Flowers polypetalous, superior.*

305. *Cissus* Cal. 1-leaved, nearly entire Berry 1-seeded, rarely 3-4-seeded, surrounded by the calyx.

306. *Cornus* Involucre 4-leaved in some Cal 4-toothed Pet 4 Drupe with a 2-celled nut.

307 *Santalum.* Cal. ½-superior, campanulate, 4-cleft. Pet. 4, squamiform. Berry 1-seeded. Embryo inverse, albuminous

308 *Trapa* Cal 4-parted. Nut with 2 opposite spines proceeding from the leaves of the calyx, 1-celled, 1-seeded.

309. *Ludwigia.* Cal 4-parted, superior, with long persistent sepals. Cor 4-petals or O. Caps. 4-cornered, 4-celled, crowned, inferior, many-seeded.

Order 2. DIGYNIA.  4 Stamens. 2 Styles.

310. *Cuscuta.* Cor. 4-fid, ovate Cal. 4-fid. Caps 2-celled, cut round

311 *Bufonia.* Cal. 4-leaved. Pet 4, shorter than calyx. Caps 1-celled, 2-valved, 2-seeded.

312. *Hamamelis.* Involucr. 3-leaved Sepals 4 Petals 4, linear, very long Nut 2-horned, 2 celled.

313. *Hypecoum.* Cal. 2-4-leaved. Pet. 4, the two exterior widest. Fruit a silique.

Order 3. TETRAGYNIA  4 Stamens. 4 Styles.

314. *Mygindia.* Cal. 4-toothed, very small, persistent. Pet. 4, rounded, flat, spreading. Stamens shorter than corolla. Style short. Stigmas 2-4 Drupe globose, 1-celled, with a 1-seeded nut.

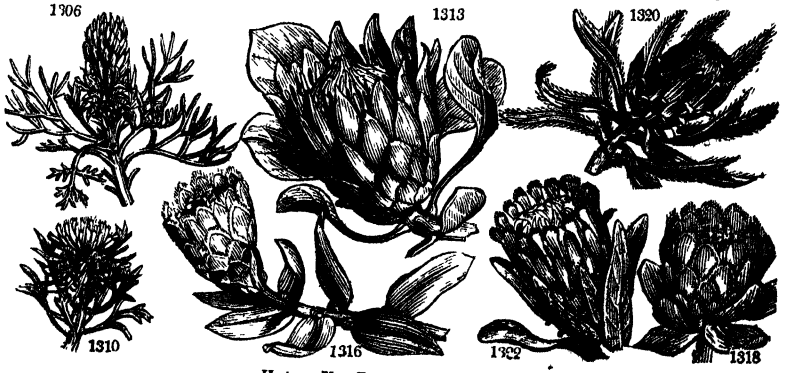
315. *Ilex.* Cal 4-5-toothed. Cal rotate, 4-cleft. Style O. Berry 4-seeded.

316. *Coldenia.* Cor. 1-petalous Cal 4-leaved Seeds 2, 2-celled.

317. *Potamogeton.* Sepals 4. Pet O Style O Seeds 4, sessile.

318. *Ruppia.* Cal and Cor. O Seeds 4-stalked

319 *Sagina.* Sepals 4 Pet 4. Caps. 4-celled, 4-valved, many-seeded.



320. *Tillæa.* Cal. 3-5-parted. Pet 3-5, equal. Caps. 3-5, 2 or many-seeded, opening inwards Nectary none.

321 *Radiola.* Cal. many-cut. Pet. 4. Caps superior, 4-8-valved, 8-celled, globose Seeds solitary.

History, Use, Propagation, Culture.

229. *Petrophila.* From πετρος and φιλεω, to love rocks, in allusion to the places in which it is found growing in a wild state Stiff shrubs, with smooth leaves of various kinds Heads of flowers ovate or oblong, terminal or axillary. Ripened cuttings root in sand under a hand-glass.

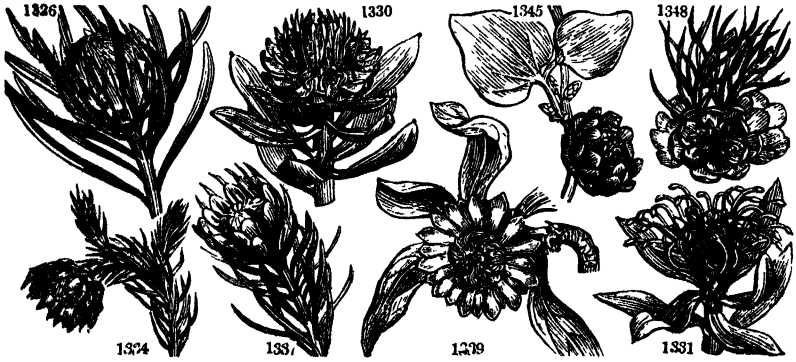
230. *Isopogon.* This genus consists of stiff shrubs, with smooth, flat or filiform, divided or entire leaves. Heads terminal or rarely axillary Flowers sometimes closely imbricated in a globose cone, sometimes clustered in a common flat receptacle which is somewhat involucrated, they thrive best in a soil composed of one-third loam, a third of peat, and a third of sand The pots must be well drained, and ripened wood may be chosen for cuttings which will root in sand and a little earth under a hand-glass They must be uncovered frequently, and the glass wiped, as they are liable to damp off if kept too close (*Sweet*)

231. *Protea.* A mythological name of Proteus the son of Ocean and Thetis, who assumed various forms upon various occasions, to whom this genus, once equally variable in its forms, has been likened. It, as Sweet observes, thrives best in a soil composed of "light turfy loam, mixed with rather more than one-third of fine sand, the pots must be well drained with broken potsherds to prevent them from getting soddened with too much water, the roots are also very fond of running amongst the small bits of sheards. Care must be taken not

MONOGYNIA.

1306 Leaves trifid bipinnate, Segments erect, Flowers silky their segments tomentose at end
1307 Leaves bi-tri-pinnatifid plain, Segments mucronate, Flowers bearded, Cones axillary stalked

1308 Leaves pinnatifid and bipinnatifid filiform furrowed above, Segment erect, Branches smooth
1309 Leaves bipinnatifid somewhat triternate filif. chan. above, Segments divaricating, Branchlets tomentose
1310 Leaves trifid pinnatifid or bipinnatifid, Leaves linear flat spreading erect smooth beneath
1311 Leaves wedge-shaped flat 3-lobed attenuated at base stalked lobes entire, Branchlets tomentose
1312 Leaves elongate oblong mucronate attenuate at base, Branches and involucres smooth



Flowers terminal.

1313 Leaves roundish stalked, Invol. silky, Inner bractes acute beardless, Style pubescent below the middle
1314 Leaves broad ovate ½ cordate sessile, Invol. silky toment. Inner bractes narr dilated at end and bearded
1315 Leaves ovate oblong cordate edged the callus of the end prominent, Invol silky fringed beardless
1316 Leaves ov. obl sessile subcord. or simple, Branches toment. Invol silky, Inner bracte elong fringed silky
1317 Leaves ov. obl. narr. at base with branches smooth, All the bracteæ sim inn dilat. at end and beard. in mid.
1318 Leaves glaucous obov. the adult smooth, Bractes red the upper lyrate spatul. fimbr obt. Petals obtuse
1319 Leaves narr. oblong veiny oblique simple at base, the edges and branches downy, Involucre ciliated
1320 Leaves linear ligulate edged ciliated, Branches hairy, Invol. long turbinate, Bract. fringed with white
1321 Leaves linear ligulate edged roughish shining with the branches smooth, Inner bract. of invol spatulate
1322 Leaves linear ligulate smooth opaque at base outside with the branches downy, Invol. fringed with black
1323 Leaves linear ligulate edged shining roughish, Branches little downy, Invol. fringed with black
1324 Leaves narrow oblong rather wavy attenuated at base, Invol. hemisph inner bearded with black and purple
1325 Leaves broad long elliptical edged the old ones pubescent wavy, Bractes pale yellow, the upper fringed
1326 Leaves elong. lin atten at base, Inv turb Bractes smooth acute beardl Beards of cal longer than segm
1327 Leaves long ligulate, Head broad convex embossed in middle, Upper bractes spatul the length of flower
1328 Leaves long ligulate, Head broad not convex, Upper bractes spatulate longer than flowers
1329 Leaves lanc. ligul. attenu. at base, Inv turb. Bractes smooth beardl viscid, Beards of flow. woolly white
1330 Leaves obl. sessile and branches smooth, Invol hemispherical beardl naked, Fl toment. Style smooth
1331 Leaves lin. lanceolate acute submucr attenuated at base, Invol. hemispherical, Bractes smooth obtuse
1332 Leaves lanc lm. mucr. pungent with an obtuse base, Bractes lanc mucr smooth, Stem erect many-flow.
1333 Leaves ligulate oblong the upper and the branches hairy, Inner bracteæ with a round and bearded end
1334 Leaves subulate mucronate, Invol nodding hemispherical, Bract. smooth obtuse
1335 Leaves linear lanceolate mucronate, Flower-bearing branches recurved, Bract obtuse at length smooth
1336 Leaves lin lanc. flat attenuated at base roughish at edge, Branches decumbent, Invol hemisph
1337 Leaves linear veinless smooth concave above, Branches smooth decumbent, Invol. obtuse
1338 Leaves lin lanc acute flat veiny above, Bractes obtuse pubesc and conc. at end, Branches wavy colored
1339 Stems short with depressed branches, Leaves obov. obl edged veiny attenuat at base, Invol hemispher.
β Leaves more glaucous and narrow
1340 Stems dwarf decumb Leaves elong lin smooth veinless recurved at edge, Invol hemispherical
1341 Stems dwarf, Leaves elong lin scrabrous obsoletely veiny recurv. at edge, Invol turbinate hemispher.
1342 Stems decumb. dwarf, Leaves elong lin roughish revol. at edge, Invol turb Bractes obtuse tomentose
1343 Stems dwarf, Leaves elongate lanc edged subundulate smooth, Invol turb Bractes tomentose obtuse
1344 Stems dwarf, Leaves elongate lanc edged smooth, Invol. turbinate, Bractes lanceolate acuminate

Flowers lateral.

1345 Leaves cordate roughish nerved, Bractes smooth
1346 Leaves cordate ovate, Stem clasping divaricate recurved at the end, Bractes pubescent
1347 Leaves linear acute, Receptacle conical, Paleæ acute
1348 Leaves subulate, Receptacle convex, Paleæ obtuse

1349 Style longer than the hairy flower, Stigma gibbous on one side, Invol downy, Leaves linear entire
1350 Style a quarter longer than the hairy flow Stigma gibb on one side, Leaves lin. obl veiny ent obt at base
1351 Style nearly twice as long as hairy flow Stigma gibb. on one side, Leaves lin. obl. entire or 2 or 3-toothed

and Miscellaneous Particulars.

to let them droop for want of water, as the young roots are of a very fleshy substance, and soon suffer by too much drought, as well as by too much wet, so that they seldom recover if suffered to flag much, they also like to be placed where they may have a free circulation of air, as they cannot bear to be crowded like some more rigid-growing plants. Ripened cuttings taken off at a joint, and pared quite smooth, will strike root if planted thinly in pots of sand placed under a hand-glass, but not plunged the glasses must be often taken off to give them air, as they are very liable to get the damp amongst them, which soon spreads if not cleaned off, and destroys them; water them regularly whenever they want it, but not over the leaves, and let them get a little dry before the glasses are placed over them again. Some of the kinds root very soon, others are a long time before they root. The quickest rooting kinds I have met with are P cordata, cynaroides, amplexicaulis, grandiflora, acerosa, nana, and acaulis. P. mellifera also roots very quickly sometimes. The same treatment will agree with several other genera belonging to this family, as Leucospermum, Spatalla, Sorocephalus, Leucadendron, and Aulax. (See *Bot. Mag* No. 1717. *Bot. Cult.* 244.) There are several kinds in cultivation, and published in Knight's Proteæ, which have not been retained here, because, as they are not acknowledged by Mr R. Brown, it is probable that they are not distinct from some which are here enumerated."

History, Use, Propagation, Culture,

232. *Leucospermum.* From λευκος, white, and σπερμα, seed, in allusion to the color of the seeds. The genus is chiefly composed of low shrubs, which are usually downy or hairy Leaves entire, or with callous teeth at the end. Heads terminal. Flowers yellow The culture as for Protea

233. *Mimetes* Named by Mr. Salisbury from μιμητης, a mimic, because it resembles various other genera. The soil for this genus is two-thirds of light loam, and one third of sand. In other respects, the treatment is the same as for Isopogon

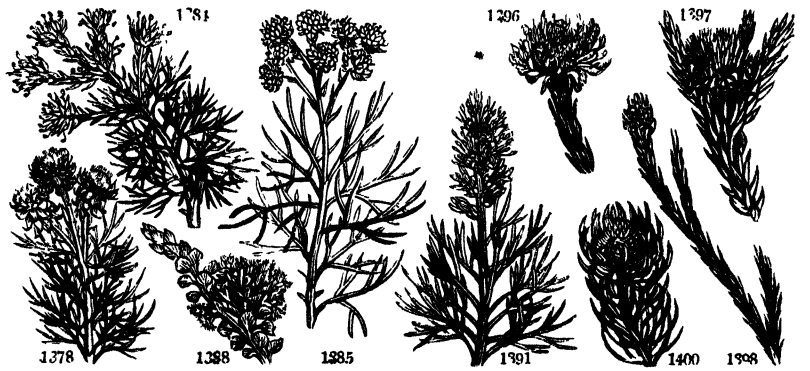
234. *Serruria.* Named by Burmannus after Professor Joseph Serrurier, a foreign botanist, of whom little is known. The species flower freely, and make handsome bushy shrubs The soil best adapted to them is one-third light loam, a third of peat, and a third of sand, with well drained pots "They also require an airy situation, as they are so crowded with leaves that the branches are liable to damp and canker if any wet settles

1352 Leaves elliptical edged, Bractes spreading · upper spatulate minutely fringed, Petals downy
1353 Style nearly twice as long as hairy flower, Stigma conical ovate gibb on one side, Leaves obl 3-4-toothed
1354 Style longer than the very villous flower, Stigma equal-sided conical, Leaves oval 3-9-toothed
1355 Style longer than very vill. fl. Stig equal-sided obl. Lvs obl. lanc. 3-toothed and entire, Branches very hairy
1356 Style longer than hairy fl Stigma equal-sided ovate, Lvs. lanc. and ellipt. entire short pub Branches hairy
1357 Leaves linear channelled veinless, Branches and bracteæ tomentose, Segments of flower bearded
1358 Leaves linear flat, Branches hairy, Bracteæ smoothish ciliated
1359 Leaves linear wedge-shaped flat veiny 3-5-toothed, Branches hairy, Bractes and segments of flow. toment
1360 Leaves linear 3-toothed, Bractes rounded tomentose twice as short as tube of flower

1361 Involucr equal-sided colored acuminate half exserted 8-10-flowered, Leaves acute entire
1362 Leaves oval lanceolate pubescent, Stigma short prominent at base
1363 Invol unequal-sided, Leaves lin oblong 3-toothed smooth the floral dilated beneath with recurved edges
1364 Stem procumbent, Leaves oval obtuse pubescent, Style smooth, Heads terminal
1365 Leaves narrow obovate almost smooth, Upper bractes longer than flowers very acuminate
1366 Stem procumbent, Branches ascending, Leaves linear subulate channelled, Segments of flower smooth

Heads simple

1367 Leaves from below the middle bipinnatifid hairy, Head sessile higher than leaves, Bractes hairy outside
1368 Leaves from base bipinnat. hairy, Ped as long as head or longer, Bractes hairy at end outside, Stig trunc
1369 Leaves from the base 3-pinnatifid pubescent, Ped 1-3 long smoothish, Bractes recurved scarcely toment.
1370 Heads terminal and axillary stalked clustered, Leaves pinnatifid and trifid more than an inch long
1371 Heads terminal longer than the stalk, Leaves pinnatifid and trifid less than an inch long, Stem pubesc
1372 Heads ter longer than stalk, Lvs sprdg upper less an inch long nearly bipin lower shorter trifid, Stem erect
1373 Heads terminal stalked, Leaves bi-tripinnatifid with the erect stem hairy
1374 Heads term sessile, Leaves bi-pin about an inch long upper longer than heads with the branches smooth
1375 Heads ter longer than stalks, Brac subul smooth hairy at edge, Lvs sub-bipinnate and branches smooth
1376 Heads ter and axil stalks branch-like squarrose, Outer bractes subul inner lanc Lvs an inch and half long
1377 Bractes a little shorter than the terminal head, Outer lanc fringed inner less villous, Leaves bipinnatifid
1378 Stem pubesc Leaves from below middle all bipinnatifid, Heads 1-3 shorter than ped Bracts reflex ciliat.
1379 Leaves bipinnatifid filiform pointed hairy, Flowers terminal sweet-scented
1380 Leaves from below the middle bipinnatifid pubescent, Heads 1-3 longer than leaves, Bractes silky at base



Heads compound

1381 Stem erect, Lvs. smth. bipin. more than an inch long, Partial heads many-fl outer brac. smth · inner silky
1382 Stem erect, Branches pub Lvs bipin an inch and more long, Partial heads few-fl All the bractes very vill
1383 Stem erect, Leaves triternate bundled less than ½ inch long common and partial heads few-flow sessile
1384 Heads corymbose 10-flow. Leaves bipinnatifid setaceous scarcely 2 inches long, Flowers silky clustered
1385 Corymbs compound, Leaves triternate ½ inch long and stem very smooth, Bractes and partial stalks silky
1386 Corymbs simple or compound, Leaves bi-tripinnat. common flower-stalk long, partial and bractes smooth

1387 Leaves obovate or lanceolate flattish simple at edge, Flower silky with appressed hairs
1388 Leaves broader than long hooded edged, Leaves of invol obt. Flower bearded style smooth, Stig clavate
1389 Stalks umbelled ½ as long as the cylindrical spike, Bractes ovate, Style 2-3ds hairy, Leaves smooth
1390 Stalks umbelled about as long as cylind spikes, Leaves obtuse divar smooth, Styles vill as far as middle
1391 Spikes cylindrical 4 times as long as their stalk, Leaves of involucrum ovate acute beardless at end

1392 Involucr 3-flowered, Segments of flower and points of bracteæ smooth, Spike naked
1393 Leaves spatulate lanceolate smooth beneath, the lower bipinnatifid, Flower bearded, Stigma cylindrical
1394 Involucr 3-flowered stalked, Segments of flower bearded, Spike naked
1395 Lvs filif less than ½ inch long, Heads few-fl Seg of fl feathery except the inner one, Spike with an invol.
1396 Leaves 3-cornered filiform more than ½ an inch long furrowed above, All the segments of flower feathery
1397 Leaves lanceolate scabrous beneath, Claws of flower glandular hairy, Stigma clavate

1398 Involucr 4-leaved, Leaflets withered at end, Spike conical headed, Flowers sessile
1399 Involucr. 2-leaved the wider leaf trifid, Spike sessile imbricated, Leaves with a sharp point
1400 Spikes racemose stalked, Bractes shorter than the 4-flowered downy involucrum, Leaves incurved
1401 Spike sessile, Bractes and invol ovate lanc vill Leaves longer than flow acute chann and branches hairy

and Miscellaneous Particulars

amongst them. Ripened cuttings taken off at a joint and planted thinly in a pot of sand, will root without difficulty under a hand-glass. but the glass must be taken off occasionally to give them air, and dry their leaves" (*Bot. Cult.* 254.)

235 *Niverna* Named by Salisbury, in compliment to Mr. James Niven, an intelligent collector, who discovered many new plants in South Africa while in the service of Mr Hibbert. Culture as for Serruria.

236. *Sorocephalus* From σωρος, a heap, and κεφαλη, a head, on account of the heads of flowers being in clusters

237 *Spatalla* A word formed by Mr Salisbury, with more wit than decency, from σπαταω, lascivio, on account of its ample stigma. Culture as for Leucospermum.

History, Use, Propagation, Culture,

238 *Persoonia* So named by Sir J E Smith, in honor of C H Persoon, the celebrated author of Synopsis Plantarum and other esteemed works: he is still living, and about to publish a new edition of his most useful Synopsis.

239. *Grevillea.* So named by Mr. R. Brown, after the Right Honorable Charles Francis Greville, a great promoter of natural history He was one of the vice-presidents of the Royal Society Some species ripen abundance of seeds, all of them thrive in an equal mixture of sandy loam and peat, and strike roots freely in sand under a hand-glass

240. *Hakea.* Named by Schreber after Baron Hake, a patron of the botanic garden at Hanover This genus thrives in equal parts of loam, peat, and sand well drained, and cuttings root readily in sand under a hand-glass.

1402 Leaves linear hairy scabrous recurved at edge, Flowers axillary, Ovary one-sided silky
1403 Leaves oblong linear mucronate rather villous, Flowers axillary solitary
1404 Leaves lanceolate or elliptical mucronate glabrous smooth, Peduncle axillary 1-flowered, Flower silky
1405 Leaves lanceolate oblong unequal-sided, Flowers smooth, Stem arborescent, Bark scarious in layers
1406 Leaves obovate acute smooth on both sides without ribs thick, Flowers axillary remote on long stalks
1407 Leaves filiform lax, Spike leafy elongated pyramidal, Floral leaves abbreviated

Style smooth, Follicle ribless.

1408 Leaves ellipt. or obl obt. mucr. broken back at the edges, Flower branches erect, Racemes abbrev. recurv
1409 Leaves elliptical oblong attenuate at base broken back at edges, Flower bearing branches recurved
1410 Leaves subulate fascicled divaricating broken back at the edge, Branches villous rounded
1411 Leaves linear lanceolate acute mucr. broken back at edges, Rac. abbreviate erect, Style very smooth at end
1412 Lvs. elong. linear broken back at edges smooth, Inner beard of flower very dense, Stalks longer than ovary

Style hairy Follicle ribbed

1413 Leaves oblong obtuse mucronate, Racemes recurved few-flowered, Pistils tomentose
1414 Leaves lanc. sub-acum mucr above dotted scabrous beneath cinereous, Branc pubes. Rac. few-fl recurved
1415 Leaves lanceol hairy beneath, Style very long compressed hairy at back [or horizontal
1416 Leaves obovate obt. mucr. above scabrous and shining beneath rather silky, Hairs of flowers appressed
1417 Leaves elliptical and obovate mucronate above roughish beneath cinereous

Pistil woolly Follicle ribless [as recurved appendage

1418 Leaves elliptical above dotted scabrous beneath cinereous with close tomentum, Stig orbic scarcely as long
1419 Leaves elliptic lanceolate little revolute at edge, Flowers scarcely higher than leaves

Raceme thyrsoid. Leaves pinnatifid. (True Grevilleæ, Br.)

1420 Leaves elongate linear pinnatifid cut or entire beneath tomentose, Racemes 3 times as short as the leaf

Leaves filiform.

1421 Leaves smooth, Flowers silky or hairy, Caps. lanceolate acuminate straight crested on both sides
1422 Leaves smooth with bloom not channelled, Petals woolly
1423 Leaves terete, Branches toment Gland attached to oblique end of stalk, Flow. silky, Caps gibbous nodose
1424 Lvs. ben. with an obsol. furr. at base and branc. s -pub Branchl. and fl-stks hairy, Caps gibb with cav. inside
1425 Leaves smooth beneath below the middle with an obsolete furrow the length of fruit, Caps. gibbous rugose
1426 Leaves furrowed above pinnatifid occasionally undivided, Flowers racemose smooth, Caps. gibbous
1427 Lvs. of upper branches filif. of lower flat, Perianths very smooth, Caps. with 2 spurs umbelled much shorter

Leaves flat, toothed, or entire [than leaf

1428 Leaves narrow-lanceol. prickly toothed minutely dotted a little rough at the edge, Caps 2-spurred convex
1429 Leaves oval opaque sinuate-toothed prickly stalked, Caps. 2-spurred ovate gibbous compressed at end
1430 Lvs. lanc. or obl. attenu at base with a few prickly teeth or entire shining veiny with branches very smooth
1431 Lvs. sinu tooth. shining veiny stem-clasp with a dilated cord base, Stem prost Bran smooth, Caps spurl.
1432 Lvs. angul. tooth. dil at end and cuneate at base cord stem clasp Stem prost. Branc pubes Caps spurless
1433 Leaves pinnatifid and bipinnatifid linear, Capsules spurless
1434 Leaves pinnatifid the anterior segments 1 inch long the posterior 1½ inch and more
1435 Leaves obovate 3-nerved reticulated wavy prickly toothed, Caps. spurless ventricose
1436 Leaves lanc entire and nerved obsoletely veined prickly at end upper pubesc. Caps term 2-spurred gibbous
1437 Lvs. elongate-lanc. entire 1-nerv acute withered at end with bran very smooth, Caps keeled on both sides
1438 Lvs. lin.-lanc. elongate entire 3-nerv. obsoletely veined rough wither at end, Bran downy, Caps lanceol
1439 Leaves entire 3-nerved veiny obovate-oblong or linear lanceolate reversed, Branches angular, Bark warted
1440 Leaves entire 5-nerved reticulated elliptical or oval pointless, Stalks and flowers smooth, Bark shining

1441 Leaves elongate lanceolate 3-nerved at base

1442 Involucres 7-flowered, Leaves linear-lanceolate cuspidate

1443 The only species

1444 Leaves wedge-shaped oblong toothed veiny smooth

1445 Leaves bipinnatifid very smooth, Segments wedge-shaped or lanceolate cut
1446 Leaves linear lanceolate elongate smooth remotely serrate

and Miscellaneous Particulars.

241. *Stenocarpus.* A handsome genus. The name is derived from στενος, narrow, and καρπος, fruit.

242. *Lambertia.* In honor of A B Lambert, Esq F R.S., vice-president of the Linnæan Society, and possessor of a rich Herbarium. This handsome plant thrives well in loam and peat not over watered. Cuttings must be taken off at a joint before they begin to push, and planted thinly in sand under a glass, and guarded from damp

243 *Xylomelum* A name derived by Sir J E. Smith from the remarkable fruit of the plant which resembles a wooden apple, ξυλον, wood, and μηλον, an apple.

244. *Telopea.* From τηλωπος, seen at a distance, in allusion to the brilliant crimson blossoms which decorate the plant, and make it a conspicuous object in its own country, as well as in our conservatories.

245. *Lomatia.* From λωμα, an edge, on account of the winged edge of the seeds.

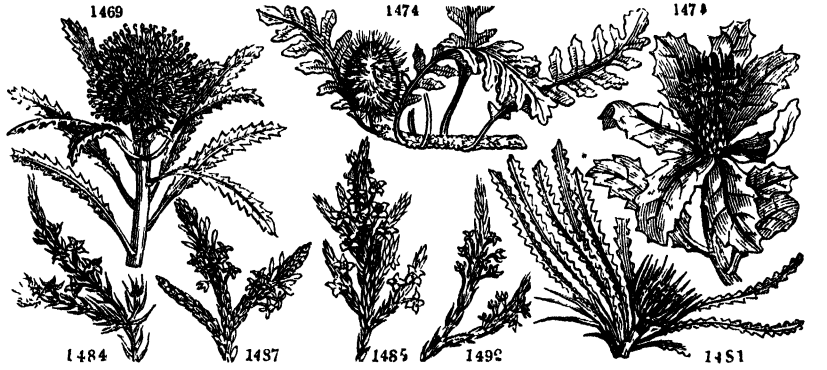
History, Use, Propagation, Culture,

246 *Rhopala.* The vernacular name of one of the species found in Guiana is Roupala. The species seldom flower, and are remarkable more for the beauty of their foliage than blossoms, which are disposed in long spikes, usually of a greenish color



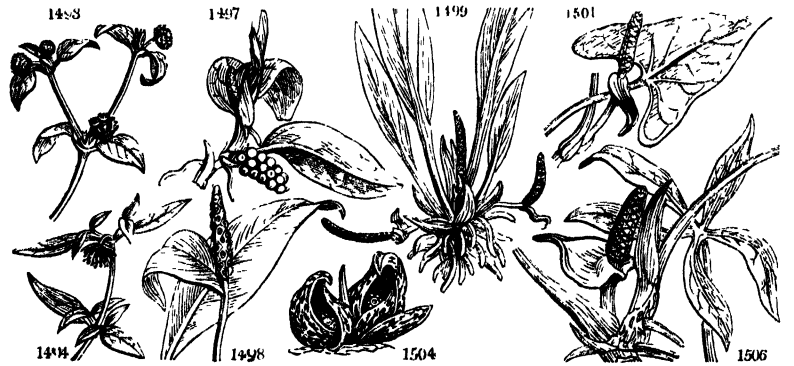
247 *Banksia* So named by Linnæus, in honor of Sir Joseph Banks, Bart, Pres R S., a distinguished promoter of the study of natural history, and of science in general he died in 1820 This is an elegant genus, and to be grown well requires a soil composed of equal parts of peat, loam, and sand. The pots must be well drained, and the following is the mode recommended by Sweet "Place a piece of potsherd about half way over the hole at the bottom of the pot, then lay another piece against it that it may be hollow, afterwards put some smaller pieces all round them, and some more, broken very small, on the top of these All plants belonging to the Proteaceæ should be drained in the same manner, as the roots are very fond of running amongst the broken potsherds, and there is not so much danger of their being overwatered, care must be taken not to let them flag for want of water, as they seldom recover if allowed to get very dry, they should also be placed in an airy part of the green-house when in doors, as nothing is more beneficial to them than a free circulation of air Cuttings are generally supposed to be difficult to root, but they will root readily if properly managed: let them be well ripened before they are taken off, then cut them off at a joint, and plant them in pots of sand without shortening any of the leaves, except on the part that is planted in the sand, where they should be taken off quite close, the less depth they are planted in the pots the better, if they only stand firm when the sand is well closed round them; then place them under hand-glasses in the propagating house, but not plunge them in

1447 Leaves alternate ovate lanceolate complicate toothed attenuated at both ends
1448 Leaves 4 together subsessile wedge-shaped oblong entire

1449 Leaves acerose entire not pointed, Claws of flower woolly, Segments smooth, Stigma a depressed head
1450 Leaves acerose entire mucronate, Flower all hairy, Stigma subulate, Cones globose
1451 Leaves acerose entire mucronate, Flower heads nodding, Flowers silky
1452 Leaves acerose emarginate 2-toothed entire, Flower heads long, Flowers silky, Stigma capitate
1453 Leaves acerose 3-toothed at end, the middle tooth longest prickly or entire at the edge, Stigma subulate
1454 Leaves linear prickly toothed; the terminal tooth shortest
1455 Leaves linear beyond the middle prickly toothed beneath veinless, Stem shrubby, Branches smooth
1456 Leaves long lin prickly toothed atten at base veinless beneath, Stem arborescent, Branchlets tomentose
1457 Leaves linear truncate mucronate entire or toothed, veins beneath inconspicuous, Ends of branches hairy
1458 Leaves linear truncate mucronate recurved at edge entire beneath netted, Ends of branches tomentose
1459 Leaves whorled oblong lanc entire mucronulate with conspicuous netted veins beneath, Stem arboreous
1460 Leaves whorled lingulate oblong obtuse unarmed beneath veinless white, Stem arborcous
1461 Leaves altern wedge-shaped obovate or obl toothed truncated ribbed reticulated at the base transverse
1462 Leaves somewhat whorled wedge-shaped obl subtrunc attenuated at base beyond middle toothed serrate
1463 Leaves scattered narr. obl trunc toothed serr beneath ribbed and veiny, Footstalks and branchl. toment.
1464 Leaves obovate oblong prickly serrate acute at base beneath ribbed reticulated cinereous
1465 Leaves wedge-shaped flat scattered truncate beyond the middle toothed serrate at the base acutish
1466 Leaves linear or wedge-shaped oblong rounded mucronulate scattered or whorled beneath netted
1467 Leaves elongate lin trunc at the base attenuate beyond the middle serrated beneath ribbed retic toment
1468 Leaves broad linear elongate truncated serrate beneath reticulated smoothish at the base attenuated
1469 Lvs broad lin clong truncated deeply serrate beneath reticulated smoothish, Stig bearded not furrowed
1470 Leaves oblong wedge-shaped subtruncate smooth cut serrate mucronate, Segments of flower awned
1471 Leaves wedge-shaped oblong truncate sinuate toothed undulated acute at base beneath ribbed veiny snowy
1472 Leaves linear pinnatifid, Lobes triangular half ovate mucronate beneath snowy obsoletely nerved
1473 Leaves pinnatifid, Lobes triangular ovate acute flat beneath nerved smoothish, Flowers smooth
1474 Leaves pinnatifid, Lobes sinuate or toothed, Stem prostrate

1475 Leaves wedge-shaped cut serrate, Bractes of involucre striated outer smoothish
1476 Leaves wedge-shaped sinuate toothed prickly stalked, Bractes all smooth silky
1477 Lvs. pinnatifid, Lobes triang flat divaricating straight prickly pointed the term longer than those next it
1478 Lvs. elongate linear pinnatifid, Lobes triangular pointless flat snow-white beneath, Involucres tomentose
1479 Leaves elongate lin pinnatifid, Lobes an equal-sided triangle mucron recurved at edge beneath snow-white
1480 Leaves lin pinnatifid longer than decumbent tomentose stem, Lobes triangular obtuse snow-white beneath
1481 Leaves lin pinnatifid as long as smooth stem, Lobes triang acute mucr beneath white with recurved edge
1482 Lvs. lin pinnatifid very long acute beneath ashy at base attenuated and entire, Lobes triang ascend decur.
1483 Leaves linear elongate pinnatifid sub-truncate white beneath, Lobes triangular decurrent divaricating

1484 Leaves linear acute spreading, Flowers naked, Anthers included
1485 Leaves linear and 4-cornered branches smooth
1486 Leaves ovate and branches rugose smooth
1487 Leaves ovate furrowed quadrifarious ciliated at edge, Glands of flower 4
1488 Leaves ovate tomentose, Glands of flower 12
1489 Leaves lanceolate ciliated, Bractes the length of germen
1490 Leaves lanceolate mucronate ciliate concave incurved at end
1491 Leaves linear ciliated, Bractes longer than germen
1492 Leaves all over hoary



and Miscellaneous Particulars

heat; the glasses must be frequently taken off to give them air and dry them, or they are apt to damp off, when they are rooted, the sooner they are potted off in little pots the better, as the sand is liable to canker their roots if left too long in it, when potted off, they should be placed in a close frame, but not on heat, as a bottom heat will destroy their roots, when they must be hardened to the air by degrees Plants raised in this way have better roots, grow faster, and flower sooner than plants raised from seeds In raising them from seeds they should be sown in the same kind of soil as the plants are grown in, and placed in the green-house; or if it is in summer they will come up sooner if placed out in the open air, they will soon make their appearance, when they should be potted off in small pots, for if left in the seed-pots too long they are apt to die, and are more difficult to move with safety" (*Bot Cult* 147)

248 *Dryandra.* Was named by Mr R. Brown after the famous Jonas Dryander, whose catalogue of the Banksian library would alone be a monument of talent and industry, if his high botanical acquirements had been unknown This genus is allied in character and habits to Banksia. It thrives best in very sandy loam and peat in well drained pots Cuttings made from ripened wood taken off at a joint before they begin to push, planted in sand without shortening any of the leaves, and covered with a glass, will root without difficulty The pots should not be plunged, and as soon as the cuttings are rooted they must be potted off, as the sand is apt to injure their roots Place them afterwards in a close frame or under hand-glasses till they strike root afresh, and then harden them by degrees (*Sweet*)

249 *Struthiola.* From στρουθος, a sparrow: the pointed seed vessels have some resemblance to the beak of a

History, Use, Propagation, Culture,

sparrow or other small bird The species are all slender, hardy, green-house plants, of pretty appearance, and easy cultivation

250 *Operculária.* From *operculum*, a lid, in allusion to the manner in which the calyx is closed Plants of no beauty

251 *Cryptospermum* From κρυπτω, to conceal, and σπερμα, seed. The seeds, or rather seed-vessels, are hidden in the involucrum Weeds of some tropical countries

252 *Pothos* From *potha*, the native name of this plant in Ceylon Most of the species are sub-parasitic, and found climbing, like ivy, on the trunks of trees in the West Indies and America. In our stoves most of the species will thrive planted in old bark and moss, and plunged in heat P palmata has leaves upwards of three feet long, with a foot-stalk nearly four feet long, palmate, as thick as strong parchment, smooth, with a midrib of a deep green above, and the fructification on spikes more than a foot in length. The species are cultivated for the sake of their foliage, which is always of an agreeable green color, and not liable to discoloration by damp or other accidents of a hot-house

253 *Rivina.* In memory of A Q. Rivinus, a native of Saxony, born in 1652, and died in 1722 He was for a long time professor of botany and medicine at Leipsig, and left behind him some valuable botanical works; and among them a very ingenious attempt at a classification of plants by the corolla, from which some modern botanists have profited more than they have acknowledged The name, as Linnæus observes, with his usual neatness, has been given to a shrub always covered with leaves and fruits, in allusion to the merit of the works of Rivinus. R. octandra, the Hoop-withy of Jamaica, and *tsanc à baril* of Martinique, has a very long tough flexile stalk an inch or more in diameter, and sometimes made into hoops in the West Indies. The berries con-

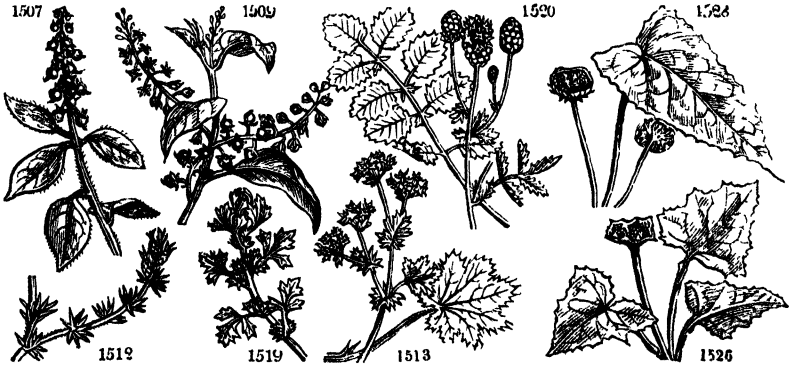
1493 Leaves opposite ovate rough, Flowers capitate, Heads stalked axiliary

1494 Stem erect 4-cornered and leaves lanceolate entire smooth

1495 Leaves lanceolate entire nerveless
1496 Leaves lanceolate 3-nerved veiny entire, Scape 3-cornered at the end
1497 Leaves ovate lanceolate entire nerved dotted
1498 Leaves obovate lanceolate pointed at both ends ribbed, Spathe oblong acuminate flat stalked
1499 Leaves obl. attenuated at both ends veiny entire, Middle rib convex on both sides with 3 keels at its base
1500 Leaves cordate lobed imbricated, Spathe flat, Scape rounded
1501 Leaves cordate acute, Lobes spreading, Spathe reflexed as long as the erect spadix
1502 Leaves cordate lobes divaricating, Spadix much shorter than the spatha
1503 Leaves cordate very obtuse
1504 Leaves cordate acute, Spadix subglobose
1505 Leaves palmated, Lobes 9 or 10 lanceolate obtuse
1506 Leaves digitate quinate ovate acuminate

1507 Leaves pubescent

1508 Leaves ovate smooth ciliated, Petioles pubescent
1509 Leaves ovate acuminate smooth flat, Stem round
1510 Leaves ovate wavy rugose, Stem furrowed
1511 Flowers octandrous and dodecandrous



1512 Tufted tomentose hoary, Stems ascending simple

1513 Leaves reniform plaited serrated, Stem and petiole smoothish, Flowers dichotomous corymbose
1514 Leaves reniform 9-lobed beneath with the stem and petioles silky, Flowers fastigiate clustered sessile
1515 Leaves reniform 7-lobed toothed silky beneath, Corymbs terminal
1516 Leaves digitate in sevens lanceolate acute, from the middle to the end deeply serrated silky beneath
1517 Leaves digitate in fives or sevens lanceolate cuneate obtuse serrated or toothed at the end silky beneath
1518 Leaves three together, Leaflets ciliated multifid smooth
1519 Leaves three parted, Segments trifid pubescent, Flowers clustered monandrous

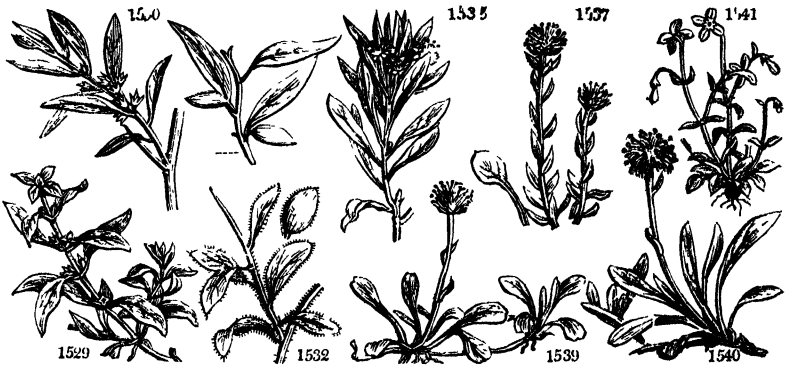
1520 Spike ovate, Stamens shorter than the cor Cal. and leaves smooth, Leaflets ovate subcordate

1521 Leaflets cordate lanceolate crenate toothed quite smooth, Stamens shorter than corolla
1522 Leaflets subsessile ovate-lanceolate finely serrated, Spikes cylindrical, Stamens longer than corolla
1523 Spikes cylindrical, Stamens longer than corolla, Cal somewhat ciliated
1524 Spikes cylindrical very long, Stamens much longer than corolla

1525 Leaves cordate oval obtuse crenulate, Receptacles orbicular
1526 Leaves cordate angular acute, Receptacles quadrangular
1527 Leaves cordate or pinnatifid palmate serrated, Receptacles quadrangular
1528 Leaves cordate sagittate undulated toothed large, Receptacles oval

and Miscellaneous Particulars

stitute the principal part of the food of the American thrush or nightingale, they contain a very oily seed, and after the bird has swallowed many of them he frequently flies to the next bird-pepper bush (Capsicum), and picks a few pods: instinct directing him to what is necessary to promote the digestion of that oleaginous heavy food.



254 *Camphorosma* Barbarously named from two words, the one Latin (*camphora*), and the other Greek (*οσμη*), signifying a smell of camphor. The plant abounds with a volatile oily salt, and is warm and stimulating, but its appearance has nothing to recommend it.

255 *Alchemilla.* Named, as Linnæus asserts, from its supposed alchymical purposes, but, as others maintain, from its Arabic appellation *álkémelych* (*J de Souza*, p. 52) A. vulgaris is eaten readily by horses, sheep, and goats, and is considered a good herbage-plant where it abounds in upland pastures A alpina is an elegant species, common on many of the Highland mountains, and supposed by Lightfoot and others to aid considerably in giving the peculiarly excellent flavor to Highland mutton A aphanes is a worthless weed.

256. *Sanguisorba* From *sanguis*, blood, and *sorbere*, to absorb The plant has passed for an excellent vulnerary This genus greatly resembles Poterium (*Monœcia Polyan*), and Professor Martyn observes, that it is certainly a defect in the Linnæan system that two genera so similar in habit should be placed so far apart. It must be considered, however, that the object of the Linnæan system was less to bring plants together according to all their relative qualities, than to associate them according to one quality, which might serve as an index by which to ascertain their names.

257 *Dorstenia.* In memory of Theodore Dorsten, a German, author of a work entitled Botanicon, printed in 1740. Its flowers, says Linnæus, are like the works of Dorsten, they have little to recommend them. The roots are imported under the name of Contrayerva roots, and used both in medicine and dyeing.

History, Use, Propagation, Culture,

258 *Isnarda* Antoine Tristan Danti d'Isnard was a French botanist, professor at the Jardin du Roi, and member of the Academy of Sciences, to which he communicated many memoirs upon plants from 1716 to 1724 An obscure marsh plant.

259 *Elæagnus* From ἐλαία, an olive the tree having a striking resemblance to the olive tree E. angustifolia is a low tree with elegant silvery leaves and a brown bark, but not of long duration. All the hardy species are commonly propagated by layers, but according to Sweet and Haynes, "cuttings will strike if taken off at a joint in ripened wood, and planted in a sheltered situation early in autumn" The green-house and stove species strike in sand under a bell-glass

260. *Globularia* From the flowers being packed in *globose* heads The species called Alypum has been so named from α, privative, and λυπη, pain, used by way of antiphrasis, according to Dalechamp, because it is a dangerous purgative Bauhin even calls it Frutex terribilis, but Clusius says, it was used by the Spanish quacks of his day as a cure for venereal diseases. It is however doubtful whether the Alypon of the old botanists is the same with the plant so called by the moderns Cuttings of the shrubby green-house species, taken off before they begin to make new shoots, root freely in loam and peat under a bell-glass, and in moderate bottom heat. The hardy and herbaceous kinds may be propagated from seeds, or divided like daisies Miller says, they prefer a shady situation and a moist loamy soil, but Sweet recommends a light sandy soil. The leaves of most of the species dry black.

261. *Houstonia* Named after Dr Wm Houston, the friend and correspondent of Miller: he died in 1733. The plants are small, elegant in their habits, and very fit for pots or rockwork.

1529 Leaves stalked ovate acute

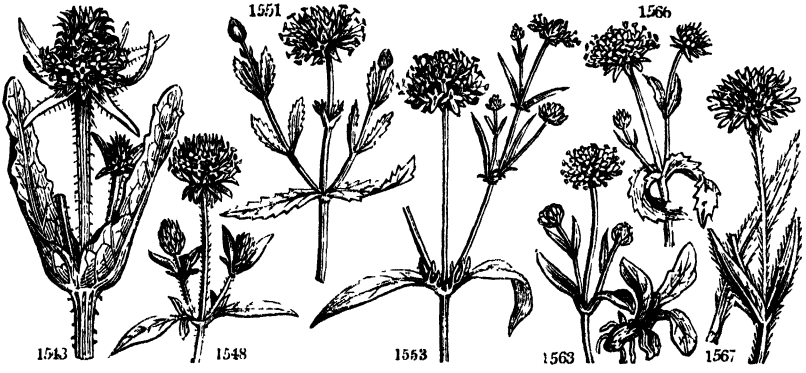
1530 Leaves lanceolate
1531 Leaves oblong acute at each end silvery, Flowers solitary nodding
1532 Leaves oblong ovate opaque
1533 Leaves ovate
1534 Leaves ovate acuminate wavy

1535 Stem shrubby, Leaves lanceolate linear entire, Flowers axillary subsessile solitary
1536 Stem shrubby, Leaves lanceolate 3-toothed and entire, Heads terminal
1537 Stem herbaceous, Radical leaves about 3-toothed much longer than the stalk, Cauline lanceolate
1538 Radical leaves crenate acuminate, Cauline entire mucronate
1539 Radical leaves wedge-shaped retuse toothed at end the intermediate tooth very small
1540 Stem naked, Leaves entire lanceolate

1541 Leaves radical ovate, Stem compound, First peduncles 2-flowered
1542 Leaves ovate lanceolate, Corymbs terminal

1543 Corona obsolete, Head cylindrical, Bractes recurved, Leaves connate entire subcoriaceous
1544 Corona obsolete, Head cylind. Bractes straight, Involucre weak longer than head, Lvs conn entire or jagged
1545 Leaves of involucre linear-lanceolate rigid about as long as the head, Leaves usually sinuately jagged
1546 Corona membranaceous, Head ovate, Involucre weak deflexed
1547 Leaves oblong serrate villous stalked sublobate, Cauline connate, Heads globular villous
1548 Corona obsolete, Head globose, Involucre deflexed not quite so long as bracteæ

Corollas 4-cleft



1549 Corona with 8 nearly eq awned teeth, Anth strip. with green at time of open Br acum pub. Corol radiant
1550 Corolla equal, Cal imbr. Radical leaves pinnated, Leafl lanc cut toothed ciliat Caul tern and sim. lin
1551 Corollas 4-fid unequal, Scales of calyx obtuse, Leaves oblong serrated scabrous
1552 Corollas equal, Scales of calyx oblong obtuse, Leaves linear smooth entire trifid and at base pinnatifid
1553 Corona with 8 equal short teeth, Bractes awned, Awns purplish black
1554 Corona with 8 teeth of which 4 are awned and the other 4 very short, Br awned, Awns rufous, Corol equal
1555 Coroll sub-equal, Scales of calyx ovate, Leaves pinnatifid
1556 Corona with 8 awned nearly equal teeth, Anth str with green at time of op Br acum pub Corol radiant
1557 Coroll radiant, Radical leaves simple, Cauline decurrent pinnated, Paleæ arid reflexed at end
1558 Corona with 4-8 obsolete teeth, Bractes awnless yellowish white the outer obtuse the inner acuminate
β Teeth of the corona distorted
1559 Coroll radiant, Calyx imbricated, Leaves coriaceous smooth lanceolate entire the upper lyrate
1560 Coroll equal, Calyx and paleæ awned, Stem simple smoothish, Leaves lanceolate almost smooth

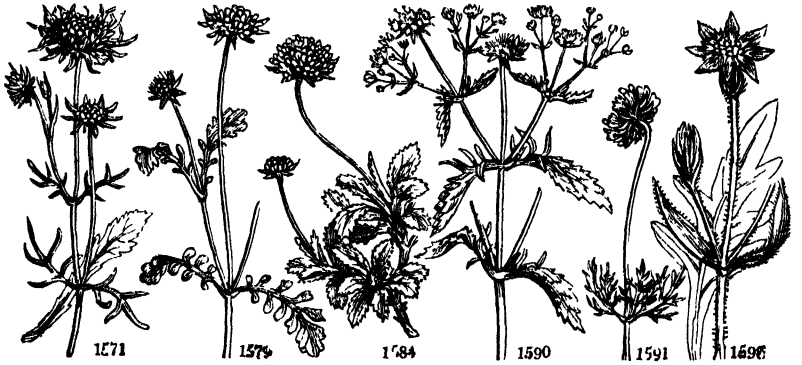
Corollas 5-cleft

1561 Coroll unequal, Stem herbaceous erect, Leaves pinnatifid, Seeds bearded and feathery pappose

Corollas 4-fid

1562 Coroll nearly equal, Stem dichotomous, Leaves oblong cauline entire subsessile radical toothed stalked
1563 Cor equal, Stem simple, Branches approximated, Leaves lanc ovate pubescent, Caul lin nearly entire
1564 Cor radiant, Leaves undivided, Radical ovate serrated, Cauline lanceolate
1565 Coroll radiant, Leaves entire pinnatifid and cut, Stem hispid
1566 Coroll radiant, Leaves all undivided ovate oblong serrated, Stem hispid
1567 Coroll radiant, Leaves oblong lanceolate entire, Stem below smooth above pilose
1568 Coroll sub-radiant, Stem and leaves ovate hispid the lower leaves stalked entire auric or pinn Calyx ci

and Miscellaneous Particulars



262 *Dipsacus* From διψαω, to thirst At the axillæ of the leaves is usually a quantity of limpid water, which may be acceptable to people who are thirsty This water once had reputation as a cosmetic *Chardon à Foulon*, Fr *Kardendestel*, Ger , and *Dissaco*, Ital D fullonum is cultivated in the west of England for raising the nap upon woollen cloths, by means of the crooked awns or chaffs upon the heads, which in the wild Teasel are not hooked For this purpose they are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them The seeds are sown in March, on well prepared strong clayey loam, broad-cast, and at the rate of one peck to the acre They are hoed, like turnips, to a foot distance, and the second year, in August, the heads are fit to cut. They are sold by the bundle or *stave*, twenty-five in each, and the ordinary produce is 160 staves per acre In Essex, carraway is often sown along with teasel, and the second year after the latter is pulled, the former is mown or reaped. (*Young's Annals*, vol xxi p 53)

D pilosus is the handsomest species, the seeds are eaten by small birds, and the flowers frequented by moths in great numbers

263 *Cephalaria* From κεφαλη, a head, in reference to the manner in which the flowers grow A mere artificial division of the genus Scabiosa, from which it differs in no natural characters whatever

264 *Scabiosa* From *scabies*, leprosy The sudorific qualities of this plant are said to be useful in cutaneous diseases. This is a vigorous-growing coarse-looking genus S succisa is one of the few examples of radix præmorsa or bitten-off root, an appearance, as Keith states, owing to the point or top of the seminal root

History, Use, Propagation, Culture.

dying off, in consequence of which horizontal roots naturally protrude themselves. Why it should rot off is not known, but is vulgarly accounted for by ascribing it to a bite from the devil. The same appearance is found in Plantago, Trifolium, and some other plants with subfusiform roots. A decoction of S succisa is an empirical specific for the gonorrhœa.

S. atropurpurea is the handsomest species, and is cultivated as a border annual and biennial It has been so long in cultivation that its native country is unknown Linnæus and Miller consider it as a native of India; Professor Martyn of the south of Europe.

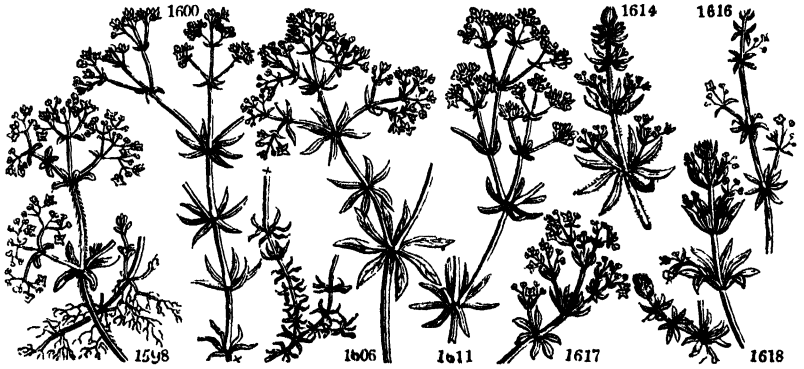
265. *Knautia.* So named by Linnæus in honor of Christopher Knaut, physician at Halle in Saxony: born in 1636; died in 1694. Another Knaut (Christian) published a system of plants in 1706, which has nothing to recommend it.

266. *Galium.* Derived from γαλα, milk; because one sort is used for the purpose of curding milk. This is a very natural genus; the roots of most of the sorts dye red, and the herb, like madder, colors the bones of animals that feed on it. The stems of all the species are four-cornered, and the leaves in whorls; the flowers ge-

Corollas 5-fid.

1569 Hoary, Coroll. radiant, Stem many-flowered, Radical leaves ovate lanceolate entire, Cauline pinnatifid
1570 Calyx very short, Cauline leaves bipinnate filiform
1571 Coroll. radiant, Radical leaves ovate or lyrate pubescent crenate, Cauline pinnate setaceous
1572 Coroll radiant, Radical leaves oblong crenated, Caul. pinnatifid · the pinnæ linear lanceolate spreading
1573 Coroll radiant, Leaves smooth, Radical ovate oblong serrate or lyrate, Caul. pinnate · the segm. lin cut
1574 Coroll equal shorter than calyx, Leaves lyrate pinnatifid hairy, Stem branched divaricating
1575 Leaves pinnate · the upper linear, Calyces 1-leaved 5-cleft
1576 Coroll. radiant shorter than calyx, Leaves pinnated the upper linear entire
1577 Silky, Lower lvs. stalked roundish or cuneate rugose cren upper pinnat. Florets uniform longer than invol
1578 Hoary very soft, Radical leaves obl crenated upper caul pinnatifid with ovate or lanc crenated segm
1579 Coroll radiant, Lvs cut, Recept. of fruit roundish, Outer limb of calyx broad membran Stem branched
1580 Coroll. radiant, Flowers subsessile, Stem dichotomous, Leaves oblong lanceolate nearly entire pubescent
1581 Coroll. radiant, Leaves cut, Receptacles of the flower subulate
1582 Coroll. radiant, Leaves pinnatifid, Segments linear, Peduncles very long, Stem rounded
1583 Calyx multifid urceolate, Coroll radiant, Leaves fleshy pinnatifid with linear stiff pinnæ
1584 Coroll. equal, Stem shrubby, Leaves simple erect
1585 Coroll. radiant, Leaves undivided elliptical serrated shining stalked

1586 Coroll. radiant, Leaves lanceolate nearly entire, Stem shrubby
1587 Coroll. radiant, Leaves linear lanceolate entire, Stem herbaceous 1-flowered
1588 Coroll. radiant, Radical leaves lanceolate stalked entire, Cauline pinnated, Stem 1-flowered
1589 Coroll. radiant, Segments entire, Lower leaves oblong coarsely serrated upper pinnatifid at base
1590 Coroll. radiant, all the segments trifid, Leaves undivided subserrate the upper pinnatifid at base
1591 Coroll. radiant longer than calyx, Leaves bipinnate longer than stem
1592 Coroll. radiant, Radical leaves pinnatifid, Cauline linear fringed at base
1593 Coroll. radiant, Radical leaves bipinnate with linear leaflets, Cauline pinnate with perfoliate stalks
1594 Coroll. radiant, Radical leaves lyrate, Cauline sub-bipinnate, Calyxes as long as disk



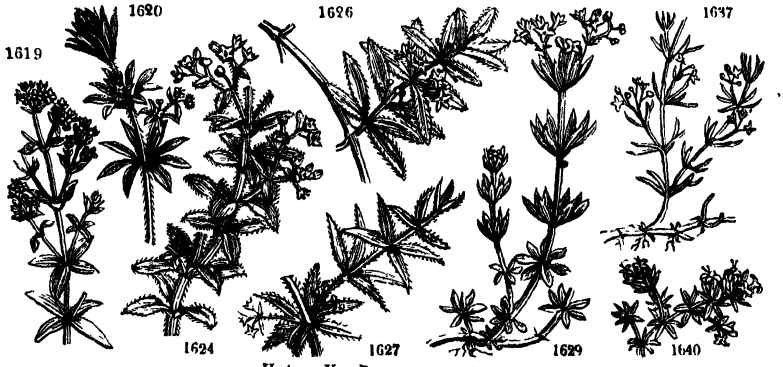
1595 Leaves cut, Cor. 5 longer than calyx
1596 Upper leaves lanceolate entire, Cor. 10 as long as calyx

Fruit smooth.

1597 Leaves 4 ovate lanceolate 3-nerved beneath scabrous, Stem erect simple
1598 Leaves 4 obovate unequal obtuse, Stems diffuse
1599 Leaves 5 reflexed lanceolate awned ciliated, Stem erect simple scabrous
1600 Leaves linear smooth mucronate, Stems 4-cornered diffuse
1601 Leaves 6 linear mucron roughish, Peduncles trichot Stems prostrate diffuse 4 angular winged branched
1602 Leaves 8 lanceolate prickly serrate forwards, Panicles trichotomous, Stems smoothish flaccid
1603 Leaves 8 hispid lanceolate linear acuminate subumbricate, Peduncles twice dichotomous
1604 Leaves 8 linear furrowed with stem smooth to the touch, Branches flexible, the flow-bearing ones short
1605 Leaves 8 elliptical lanceolate obtuse mucronate at the edge rough horizontally spreading, Stem flaccid
1606 Leaves 8 smooth lanc. scabrous beneath, Floral in pairs, Panicle term Ped capill Stem rounded smooth
1607 Leaves 8 linear lanceolate very smooth, Peduncles panicled capillary, Stem rounded
1608 Leaves whorled linear above scabrous, Panicle divaricating, Stem erect rounded pilose roughish
1609 Leaves 8 lanceolate smooth mucronate, Panicle capillary, Petals awned, Stem 4-cornered weak
1610 Leaves 8-6 obovate lanc. mucr rough at edge, Peduncles 3-flow Petals awned, Stem 4-cornered smooth
1611 Leaves whorled linear, Peduncles dichotomous flower-bearing from the top of the stem which is smooth
1612 Leaves whorled linear setaceous, Peduncles capillary longer than the leaves
1613 Leaves whorled linear spreading, Peduncles very short
1614 Leaves 6 lanceolate keeled rough aculeate backwards joints simple
1615 Leaves 6 or 8 lanceolate prickly serrate backwards mucronate stiff, Cor. larger than fruit
1616 Leaves 6 linear lanceolate mucronate thin, edges and the stem scabrous, Peduncles bifid, Fruit granular

Fruit rough or hispid

1617 Leaves 4-6 oblong with short point rough at edge, Panicles close, Stem weak short smooth
1618 Leaves 8 lanc at edge and stem aculeate backwards. Peduncles axillary 3-fl Fruit granular nodding



and Miscellaneous Particulars.

nerally axillary, but sometimes panicled. G. verum, *petit Muguet*, Fr. is called bed-straw, from the verb to strew, strow, or straw, being one among a variety of odoriferous herbs which were formerly used to strew beds with. The bruised plant is sometimes put in milk intended for cheese to give it a flavor and color. Boiled in alum-water, the flowering stems dye a good yellow color, and the roots a red equal to madder They were once cultivated like that plant, at the recommendation of the Committee of Council for Trade, and yielded 12¾ cwt. of dried roots per acre. G mollugo, of which there are several varieties, and G. sylvaticum and boreale have similar qualities, though in a less degree.

G. aparine, (from *ἁπτω*, to lay hold of), has the fruit set with hooked bristles which adhere to whatever they come in contact with, whence it was called by the Greeks *Philanthropos* (man-lover), and by us cleavers, catch-weed, *scratch-weed*, &c ; and from being a favorite food or medicine with geese, goose-grass, &c Linnæus informs us, that they use the stalks in Sweden as a filtre to strain their milk through Dioscorides relates, that the shepherds made the same use of it in his time, and certainly it is no bad thing to take hairs from milk, where a sieve is not at hand. It is reckoned to purify the blood, and for that purpose the tops are

History, Use, Propagation, Culture,

an ingredient in spring-broth The expressed juice of the herb, taken to the amount of four ounces or a quarter of a pint night and morning, during several weeks, is very efficacious in removing many of those cutaneous eruptions, which are called, though improperly, scorbutic The seeds have been substituted for coffee The roots, like those of most of the species, will dye red, and, eaten by birds, tinge their bones of that color It is a very troublesome weed, particularly in young hedges, but being an annual is easily eradicated

G tuberosum is cultivated in China for the roots, which are eaten boiled, either whole or in meal, and Loureiro says, are esteemed salubrious It has not yet been introduced

267. *Rubia.* From *ruber*, red R tinctorum has an annual stalk, which trails or climbs, supporting itself in the latter case by its leaves and prickles Its root is composed of many long thick succulent shoots nearly half an inch in diameter, striking deep into the ground, and growing to the length of three or four feet. From them is procured a well-known red and scarlet dye used by clothiers and callico-printers, and employed to a great extent, though chiefly from foreign roots England was formerly supplied with this article exclusively from Holland, and as in times of political derangement the price was greatly increased, its dearness induced some patriotic individuals, who had recently set on foot the Society of Arts, to attempt its culture in England. Miller paid great attention to the subject about 1758, publishing separately, as well as in his Dictionary, the Dutch practice as observed by him while in Holland A Young, in his "Annals," details several trials; the result of which, and especially those of J Arbuthnot in 1765, proves, that it could be grown here to as great perfection as in Holland, but not sold at so low a price Its culture was not therefore encouraged, and we are now supplied from Holland, France, Italy, and Turkey, and the cochineal is very generally in use as a substitute. Like others of the natural order of Rubiaceæ, madder tinges with a florid red color the milk, urine, and bones of the animals that feed on the plant. The hardest part of the bones receives the color first, which gradually extends through the whole substance, but if the plant be alternately given and inter-

1619 Leaves 4 lanceolate 3-nerved smooth, Stem erect, Fruit hispid
1620 Leaves 8 lanc. keels and edge scab. acul. backw Stem flaccid, Joints vill. Fruit covered with hooked hairs
1621 Leaves 4 subovate pilose nerveless, Fruit hairy
1622 Hairy leaves about 6 linear lanceolate, Stems woody

1623 Leaves 6 lanceolate smooth above: their edge and keel beneath scabrous, Stem herbaceous aculeate
1624 Leaves 4 perennial lanceolate above shining smooth their edge and rib beneath scabrous
1625 Leaves perennial 6 elliptical shining, Stem smooth
1626 Leaves perennial elliptical at the edge and keel very prickly, Stem rough shrubby
1627 Leaves perennial linear above scabrous
1628 Leaves perennial 4 cordate oblong stalked 3-nerved above and at the edges scabrous

1629 Leaves 8 lanceolate, Corymbs terminal stalked, Seeds echinate
1630 Lower leaves 4 obovate, upper 5-6-8, Flowers terminal sessile aggregated, Involucres ciliated
1631 Leaves hairy acute 6 longer than the joint, Flowers terminal aggregate sessile longer than involucrum
1632 Leaves 6 linear acute toothletted . the lower hirsute, Flowers aggregate terminal
1633 Leaves 4 ovate lanceolate 3-nerved, Flowers fascicled terminal
1634 Leaves 4 together oblong . the lateral revolute obtuse pubescent
1635 Leaves linear fleshy: the lower 4, Flowers 3 awned
1636 Cauline leaves 4 linear the lower elliptical the upper in pairs all rough awned, Cor rough
1637 Leaves linear the lower 6 3-nerved, the middle 4, the upper opposite, Stem flaccid, Cor smooth 3-fid
1638 Lower leaves 4 lanceolate upper linear very unequal in pairs, Stem erect, Fruit smooth tubercled
1639 Leaves 4 linear the lower imbricate, Stem much branched at base procumbent, Flowers 4-fid
1640 Hispid, Leaves 6 oblong-ovate acute revolute at edge, Stems decumbent
1641 Leaves 4 elliptical obsoletely nerved smooth glabrous at edge, Fruit scabrous
1642 Leaves linear the lower 6, middle 4, upper opposite, Stem flaccid, Cor 4-fid scabrous outside

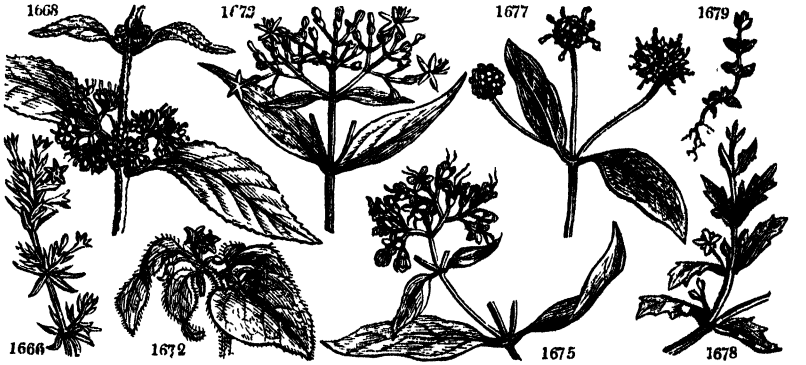
1643 Lower leaves 8 and 4, Flowers terminal, Stem and branches scabrous, Involucres naked
1644 Leaves 6 linear. floral in pairs opposite, Branches simple, Flowers two, Fruit hispid subsessile

1645 Smooth, Leaves lanceolate, Stamens included, Flowers whorled, Seeds hairy
1646 Smooth, Leaves ovate, Stamens exserted, Flowers whorled ciliated
1647 Leaves and bractes oblong ovate hispid, Stalks stem-clasping, Flowers capitate, Stamens exserted
1648 Smooth, Leaves subsessile lanceolate acute, Flowers whorled small, Stem procumbent rooting
1649 Smooth, Leaves lanceolate, Whorls globose
1650 Hispid, Leaves obovate oblique, Flowers axillary in pairs
1651 Hairy, Leaves ovate the upper four together, Heads terminal
1652 Leaves linear-lanceolate lined
1653 Stem decum. rounded smooth, Lvs obl lanc atten at base, Stipules setose, Fl. whorled, Style exserted
1654 Stem erect slightly downy, Leaves stalked oblong acute rough and pubescent at edge, Stamens exserted
1655 Stem erect 4-cornered hairy, Leaves acute entire lined pubescent with very short hairs, Flowers termina.
1656 Stem ascending very smooth 4-cornered, Leaves stalked ovate acuminate thin, Flowers whorled
1657 Resembles Sp verticillata, but the leaves are shorter and obtuse with a point, at the edge and back rough

1658 Erect, Leaves 6 linear, Flowers spiked
1659 Procumbent, Leaves 4 lanceolate, Flowers spiked

and Miscellaneous Particulars

mitted, the bones are found to be colored in concentric circles In medicine, madder was formerly used in complaints of the kidnies



To cultivate the madder, choose a deep sandy loam, and prepare it by trenching or very deep ploughing Plant cuttings of the roots in rows, eighteen inches by one foot in the row, in March, and the third year they may be taken up in September The roots are next kiln-dried, and afterwards threshed to clean them from earth and dust. They are then dried a second time, and immediately afterwards pounded or stamped in a mill. It is cultivated extensively in Zealand, and especially in the isle of Schowen · round Avignon and in Lombardy it is grown on narrow ridges, and irrigated by directing water along the furrows.

268. *Asperula* From *asper*, rough The species *cynanchica* is so called from κυναγχη, to choak, it being a specific in cases of squinancy. The English name of this genus is supposed to be a corruption of the word *woodrowel*, the whorls of leaves, according to Turner, representing certain kinds of "rowelles of sporres." All the species, excepting arvensis and cynanchica, will thrive in the shade and drip of trees in a moist soil A. odorata has a pleasant scent like Anthoxanthum: it imparts a grateful flavor to wine, an agreeable perfume to clothes, and preserves them from insects. It is eaten by cattle and horses, and from containing an acid principle, with much fixed alkaline salt, has been thought useful in obstructions of the liver and biliary ducts The roots of A. tinctoria are used in Gothland to dye wool a red color.

269. *Sherardia*. So named in honor of the famous Sherard, of whose noble garden at Eltham Dillenius's Hortus Elthamensis is a living monument, and whose herbarium is still one of the few things which recommend Oxford to the notice of a botanist. This is a little insignificant weed, by no means worthy to be consecrated to the memory of so celebrated a man.

270. *Spermacoce*. From σπερμα, seed, and ακη, point. The seeds have two remarkable points. The rubbish of the tropics.

History, Use, Propagation, Culture,

271. *Crucianella* A diminutive of *crux*, a cross, some of the roots having their leaves in whorls of four These are small herbaceous plants of little beauty, natives of the south of France, and rarely seen in this country except in botanic gardens

272. *Callicarpa* From καλος, beautiful, and καρπος, fruit Its berries are of a bright purple color.

273. *Witheringia* In honor of Dr W. Withering, the author of a classification of English plants, which has been one of the most popular of our English botanical works, and deservedly so, although it has now yielded to others of a more modern character.

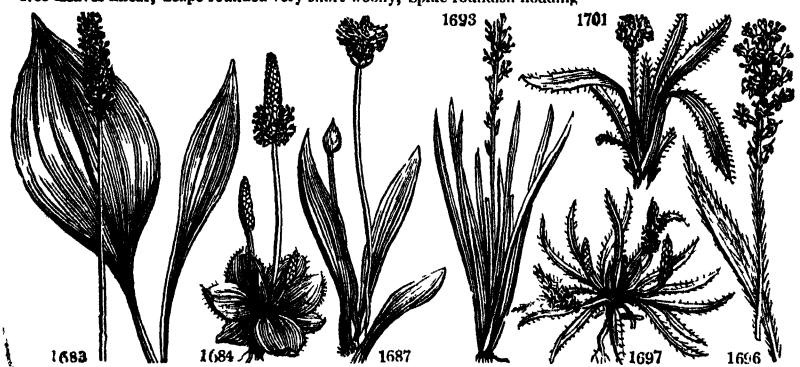
274 *Ægiphila.* From αιξ αιγος, a goat, and φιλος, friend, beloved by goats In Martinique the plant is called *Bois de Cabri.*

275. *Cephalanthus.* From κεφαλη, a head, and ανθος, a flower, because the flowers grow in heads. This is a low evergreen shrub, with large light green leaves, and the flowers in spherical heads, about the size of a musket bullet. It has a good effect on lawns in scattered groups, or in the front ranks of shrubberies. Sweet says, "soil that has some peat in it suits them best," and that they are readily propagated by layers, or ripened cuttings under a hand-glass. Miller, in whose time the art of striking cuttings was not nearly so well understood as at present, recommends a moist light soil, and propagating from seeds.

1660 Leaves 4 sublinear, Flowers spiked 5-cleft
1661 Diffuse, Leaves 6 revolute at edge, Bract. linear subulate roughish, Flowers scattered
1662 Erect, Leaves 6 linear pubescent, Heads stalked axillary and terminal
1663 Diffuse, Leaves 4 or 2 lin. keeled, Bract ciliated loosely spiked, Seeds oval covered with obtuse tubercles
1664 Procumbent suffruticose, Leaves 4 mucronate, Flowers opposite 5-cleft
1665 Procumbent, Leaves acute, of the stem in 4s ovate, of the branches 6 linear, Flowers spiked
1666 Erect, Leaves whorled 8-12 linear lanc. scab. Fascic. of flowers stalked term. and axillary, Cor. 5-cleft

1667 Lvs. ovate acum uneq. obtusely toothed at base wedge-shaped atten. entire beneath and branches toment.
1668 Leaves ovate toothletted running down the petiole beneath hoary villous, Panic dichotomous
1669 Leaves ovate rounded at base entire somewhat toothletted rugose above beneath with the branches woolly
1670 Leaves ovate lanc serrulate reticul. hoary beneath, Corymbs axillary dichotomous longer than petioles
1671 Leaves broad lanceolate serrate roughish beneath, Cymes terminal and axillary

1672 Stem hairy herbaceous angular, Leaves ovate lanceolate pilose, Stalks 1-flowered umbelled axillary



1673 Leaves ovate lanceolate acuminate smooth, Branches diffuse, Panic. terminal and axillary, Cal smooth
1674 Leaves ovate lanceolate beneath and the stalks hairy, Peduncles axillary solitary
1675 Leaves ovate lanceolate with a long point smooth on both sides, Pan diffuse axillary and terminal
1676 Leaves obovate acuminate smooth on both sides, Pan. axillary and terminal, Stalks and calyxes less pub.

1677 Leaves opposite and ternate oblong oval acuminate

1678 Leaves 3 together, Flowers stalked

1679 Leaves alternate ovate, Flowers sessile

1680 Lvs. ovate smoothish generally shorter than footst. Scape rounded, Spike cyl. slender, Caps many-seeded
1681 Leaves obovate shining undulated fleshy sessile, Scape compressed below, Flowers imbric remote at base
1682 Leaves ovate smooth somewhat toothed, Scape angular, Spike with distinct flowers
1683 Leaves ovate subdenticulate 9-nerved pubescent, Spike cylindrical imbricated, Scape rounded
1684 Leaves ovate pubescent longer than the footstalk, Scape rounded, Spike short cylindrical, Filam lilac
1685 Leaves lanceolate ovate pubescent toothletted, Spikes cylindrical pubescent, Scape angular
1686 Leaves lanceolate 5-nerved toothed smooth, Spike oblong cylindrical, Scape angular
1687 Leaves lanceolate acuminated both ways, Spike short ovate cylind. Scape angular, Caps. 2-seeded
1688 Leaves elliptical, Spike with distinct flowers
1689 Leaves lanceolate somewhat toothed, Spike ovate hairy, Scape rounded
1690 Leaves linear lanceolate toothletted silky, Scapes ascending with appressed hairs, Caps tumid
1691 Leaves lanceolate linear entire, Hairs scattered, Scapes erect rounded, Spike cylindrical dense
1692 Leaves oblong toothed 5-nerved hairy, Scapes ascending angular hairy, Spike cylindrical dense
1693 Leaves linear nearly entire obtuse fleshy, Scape rounded, Spike erect, Flowers distant
1694 Leaves linear convex beneath a little toothed smooth, Scape rounded hirsute, Spike cylindrical smooth
1695 Leaves broad lanceolate 3-nerved a little toothed pilose, Scape angular, Spike oblong hairy
1696 Leaves lanceolate oblique villous, Spike cylindrical erect, Scape rounded
1697 Leaves lanc. lin. somew. chan. ent woolly, Scape rounded hirsute, Spike cyl Stam. not longer than flower
1698 Leaves linear ciliated, Spike cylindrical, Stem hirsute
1699 Subcaulescent, Lvs. lin lanc obsol 3-nerv toothl. hoary, Spike roundish, Br winged keeled shorter than fl
1700 Leaves linear attenuated both ways flat 3-nerved, Scape rounded
1701 Leaves lin. atten remotely toothed, Scape rounded hairy, Spike obl acute, Br ovate membranous at edge
1702 Leaves linear lanceolate hairy longer than the rounded hairy scape, Spike ovate erect, Bractes lanceolate
1703 Leaves linear, Scape rounded very short woolly, Spike roundish nodding

and Miscellaneous Particulars.

276 *Scoparia.* From *scopa*, a broom In the Antilles brooms are made of the twigs This plant is treated as a tender annual, and after being raised in the hot-house or hot-bed, is potted off, and kept in the greenhouse, or planted out in the flower borders.

277. *Centunculus.* A name given by the Romans to a small plant found in cultivated lands The present is a little mean weed of no use or beauty

278. *Plantago.* A name of which no satisfactory explanation has been given. Of the species, Psyllium is derived from ψυλλος, a flea, in allusion to the appearance of its little seeds Lagopus, from λαγος, a hare, and πους, foot; its velvety or silky spike resembling the foot of such an animal. Coronopus, from κορωνη, a crow, and πους, foot; its deeply-cut leaf having been compared to a bird's foot Cynops, signifying dog's-eye, is the name of a plant of Pliny, and one of his plantains This is a genus of little beauty, and no great utility. Like all other plants known to our botanical forefathers, they were said to have their medical virtues, but that is nothing, or at least but little guide to their absolute use in the arts P lanceolata (rib-grass) has been employed in agriculture as a herbage plant, but to which it appears to have no great claim Where it abounds naturally, it is a certain indication of a dry soil Haller attributes the richness of the milk in the alpine dairies to this plant and Alchemilla vulgaris, but Linnæus says cows refuse it. This every shepherd knows to be the case as far as

History, Use, Propagation, Culture,

respects the flower-stalks Zappa of Milan, and A Young, speak in high terms of it, but the general feeling and practice of scientific agriculturists is against it, and it is now seldom sown.

P. major is a native of most parts of Europe and of Japan, and always by way-sides, whence its name of way-bread or way-bred The seeds afford food to linnets, finches, and other small birds, and the leaves are a common application to wounds and cutaneous sores An American negro once received a reward from an assembly of South Carolina for a cure for the bite of the rattle-snake, and in the receipt, it is said by Woodville (*Med. Bot*), plantain was a principal ingredient. There are several varieties of this species to be met with in rich pastures and in botanic gardens, such as the rose P, in which the flower appears changed into a tuft of leaves expanded like a rose, and the besom P, in which the spike-leaves are imbricate and pyramidal

P. maritima varies in size and situation more than most plants Its leaves are sometimes scarcely an inch, and at other times more than a foot in length; and the number of flowers in the spike varies extremely Like Statice armeria and Sambucus nigra, it is found on the summits of the highest mountains, in the clefts of rocks, on the sea-shore, in salt marshes, and muddy banks

P. coronopus is a singular-growing plant, with recumbent stems pressing closely on the ground. The leaves have a very peculiar flavor, and are rather disagreeable, but were formerly used in salads. P psyllium is sometimes imported from the south of France in a dried state for the druggists.

279. *Buddlea.* In honor of Adam Buddle, a name well known to the English botanist as authority for many rare British plants. B globosa is a very handsome shrub, and though rather tender, flowers freely in warm situations, or against a wall, with protection in very severe winters. Its leaves are long, narrow, pointed,

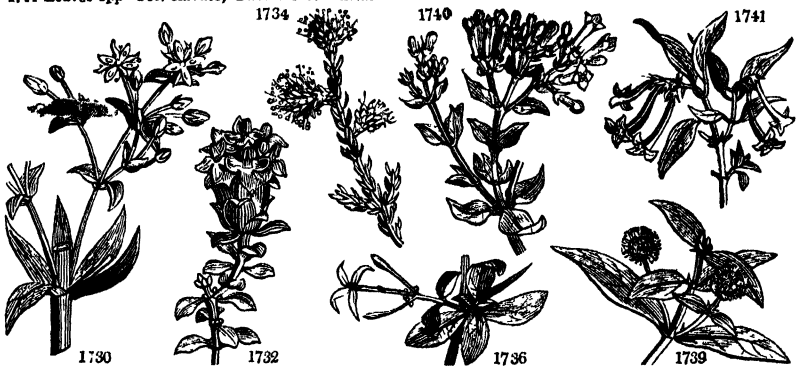
1704 Leaves semicylindrical entire woolly at base, Scape rounded
1705 Leaves lin. flat somew toothed smooth at base, Spike cyl Scape rounded hairy scarcely longer than leaves
1706 Leaves linear channelled recurved naked
1707 Leaves linear channelled entire beneath with rigid ciliæ hairy at base, Scape rounded pubescent
1708 Leaves spatulate cut-toothed, Teeth imbricated mucronated, Scape rounded hairy
1709 Leaves lanceolate 5-nerved toothed serrate, Scape rounded
1710 Leaves linear pinnate toothed, Scape rounded
1711 Leaves linear sub-toothed, Scape rounded, Head ovate, Bractes keeled membranous
1712 Leaves ovate entire fleshy rough woolly at base, Capsules 4-seeded
1713 Stem erect simple short, Leaves lanceolate fleshy entire stem-clasping hairy, Heads oblong leafless
1714 Stem branched herbaceous, Leaves somewhat toothed recurved, Heads leafless
1715 Hoary, Stem erect branched herbaceous, Leaves nearly entire, Heads leafy and sepals ovate
1716 Herbaceous, Stem branched diffuse decumbent, Leaves linear entire, Heads squarrose
1717 Stem branched herbaceous, Leaves linear entire reflexed, Heads leafy
1718 Stem branched herbaceous erect, Leaves linear channelled entire, Heads leafless
1719 Stem branched herbaceous weak, Leaves subulate entire, Heads leafy
1720 Stem branched suffruticose, Leaves entire filiform straight, Heads somewhat leafy
1721 Stem branched shrubby, Leaves lanceolate toothed, Heads leafless

1722 Leaves lanceolate acuminate crenulate beneath hoary, Heads globose stalked
1723 Leaves lanceolate subserrate hoary underneath, Spikes terminal lengthening with flowers threefold
1724 Leaves lanceolate cordate crenate rugose beneath tomentose, Flowers panicled
1725 Leaves linear lanceolate entire revolute at edge tomentose beneath, Corymbs terminal

1726 Leaves oblong nerved stem-clasping, Bractes cordate perfoliate longer than calyx
1727 Flowers spiked whorled and ternary, Leaves ovate lanceolate, Stem nearly simple
1728 Limb spreading, Stem filiform branched, Radical leaves roundish, Cauline subulate

1729 Flowers 5-cleft, Sepals cordate striated membranous keeled, Stem dichotomous, Leaves cordate

1730 A singular plant found in morasses in North America, and resembling Swertia



1731 Flowers terminal, Leaves cordate acuminate smooth
1732 Leaves rhomboidal wedge-shaped fleshy smooth, Flowers terminal

1733 Anthers exserted awnless, Cal 4-leaved, Bract. 3 length of cal Leaves 4 oblong acerose hairy imbricated
1734 Anthers exserted awnless, Leaves 4 ovate smooth, Flower-heads cernuous
1735 Anthers included awnless, Leaves 4 ovate subciliated, Flowers umbelled, Stem flexuose erect
1736 Anthers subexserted awnless, Cal 1-leaved pilose, Cor. campanulate pilose above, Flowers axillary
1737 Leaves 4 smooth, Calyx lacerated ciliated

1738 Leaves ovate acuminate entire, Peduncles axillary

1739 The only species

1740 Leaves ternate lanceolate, Stamens included
1741 Leaves opp Cor. clavate, Tube smooth inside

and Miscellaneous Particulars

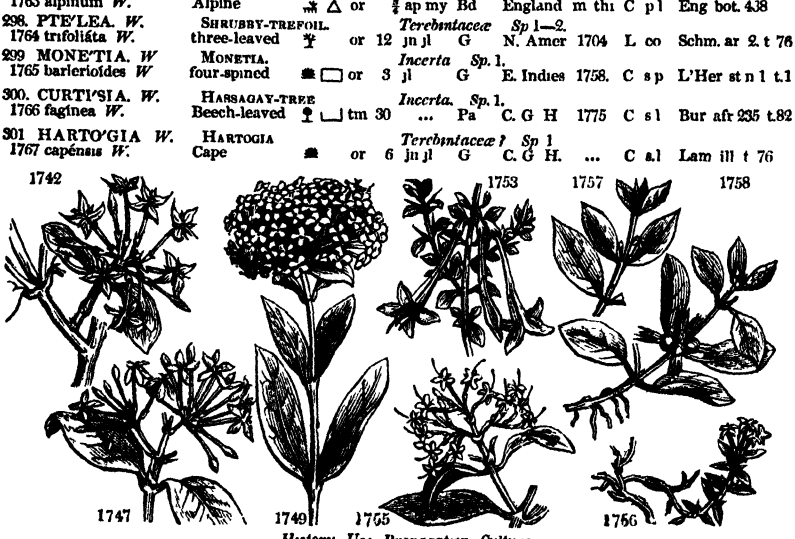
rugose, of the color of the common sage, and the flowers are very fragrant. It is commonly propagated by layers, but cuttings of the young wood of all the species root freely in common earth under a hand-glass. Buddlea Neemda is one of the most beautiful plants of India

280. *Exacum* The ancient name of a plant nearly related to Centaurium; said to have been derived from ἐξ and ἄγω, to conduct out, on account of its properties of expelling poison taken into the stomach.

281 *Sebæa.* A genus nearly related to the last, named after the famous Albert Seba, whose museum was once one of the wonders of Europe.

282. *Frazera.* After Mr John Frazer, an indefatigable collector of plants in North America.

283 *Penæa* In honor of P. Pena, who published Adversaria Botanica, 1570, in conjunction with Lobel. A handsome genus, readily propagated by cuttings in sand under a hand-glass. Many of the finest species remain to be introduced from the Cape of Good Hope.



284. *Blæria* In honor of Patrick Blair, who practised physic at Boston in Lincolnshire, and was one of the fellows of the Royal Society He published Botanical Essays in 1778. The species resemble some kinds of heaths, and require the same treatment.

285 *Chomelia* Named after Pierre Jean Baptiste Chomel, a French botanist, physician to Louis XV., he died in 1740. Culture as for Siderodendrum.

286 *Adina.* From ἀδινός, clustered, its flowers being in heads A small Chinese plant, with flowers looking like those of a Cephalanthus. It is probably not different from Cephalanthus

287 *Bouvardia* Named after Dr. Charles Bouvard, formerly a superintendent of the Jardin du Roi at

History, Use, Propagation, Culture,

Paris. B triphylla is a beautiful, and not very tender plant, which flowers great part of the year, var β has smooth shining leaves, and flowers of a deeper scarlet than the other B versicolor requires the warmest part of the green-house, and the cuttings require bottom heat, with the same soil as the plants

288 *Ixora.* A name of doubtful origin. Iswara is the name of an Indian divinity According to Sweet, the species of this beautiful genus "require to be kept in a moist heat to thrive well, but not plunged in tan, as that is almost certain to injure their roots A mixture of sandy loam and peat is the best soil for them. Care must be taken to keep them clean and free from insects, or they will not thrive Cuttings root very freely in sand under a hand-glass.

289. *Catesbæa.* So named by Gronovius, in honor of Mark Catesby, author of the natural history of Carolina, &c. who discovered the first species of this genus It is very ornamental C. spinosa has flowers about six inches long, in the form of a Roman trumpet, and succeeded by fruit the size of a pullet's egg; the skin smooth and yellow, and the pulp like that of a ripe apple, with an agreeable taste It does not flower very freely, but strikes root readily in sand under a bell-glass, and in moist heat.

290. *Pavetta.* The name of the plant in Malabar A small genus nearly related to Ixora, with flowers usually white, as those of Ixora are red.

291. *Ernodea* From ἔρνυδης, branching, in allusion to the habit of the plant

292. *Siderodendrum.* From σίδηρος, iron, and δένδρον, a tree Wood, compared for hardness to iron This tree may be noticed on account of an anomaly which occurs in the corolla, which is often changed, perhaps by some insect, into an oblong bag, half an inch in length, fleshy, and hollow within, and ending in a point at top like a fruit. Cuttings of ripened wood root in sand under a hand-glass.

293. *Coccocypsilum.* From κόκκος, fruit, and κύψελη, a vase, its berry being surmounted by a corona resembling a little cup. Cuttings root freely in sand under a bell-glass

294. *Mitchella.* Named after John Mitchell, an Englishman, who travelled in Virginia, and left some papers upon North American plants behind him. This is one of those plants which Humboldt (*De Distrib. Plant*) calls

1742

1743 Shrubby spreading, Lvs. oval stem-clasping, Corymbs crowded, Segm. of cor. ovate obt. Berries crowned
1744 Leaves elliptical acute cordate at base sessile, Umbels terminal aggregate, Segm. of cor. ovate acute
1745 Corol. long bearded at mouth, Lvs. opp obl. entire smooth shining, Floral lvs. round cord. sess. Pan. open
1746 Leaves subsessile oblong smooth, Panicles ovate oblong decussated, Pet. oval, Style hairy
1747 Leaves obl. acute with a contr. emarg base pubesc. beneath subsessile, Corymbs large, Pet. cuneate acute
1748 Leaves sessile broad lanceolate, Corymbs decompound dense, Pet. obovate reflexed
1749 Shrubby straight, Lvs. subsess. obl. Corymbs dense, Pet. round spreading, Anthers round bristle-pointed
1750 Leaves ovate-lanceolate, Cyme trichotomous contracted
1751 Leaves wedge-shaped lanceolate acuminate, Corymbs terminal, Sepals conical
1752 Leaves coriaceous oval lanc. Cymes decompound close, Petals wedge-shaped obovate, Anthers sessile

1753 Tube of corolla very long, Berries oval
1754 Tube of corolla 4-cornered short, Berries roundish

1755 Leaves smooth entire, Panic. fastigiate axillary and terminal, Style twice as long as corol. Stigma entire

1756 Leaves in 4s oblong obtuse smooth, Stem shrubby

1757 The only species. Branches 4-cornered, Leaves 5-6 inches long elliptic lanceolate

1758 Stem herbaceous creeping, Leaves ovate, Flowers clustered axillary sessile

1759 A little creeping plant with flat round leaves and little scarlet berries

1760 Umbels naked lateral alternate, Leaves linear
1761 Pedunc. many-flowered, Leaves linear lanceolate

1762 Leaves ovate acuminate, Racemes many-flowered, Stem twining shrubby

1763 The only species

1764 Leaves on long stalks ternate, Fruit with two wings

1765 A small prickly shrub, Leaves opposite ovate acute entire The only species

1766 The only species Leaves ovate oblong acute serrated opposite

1767 Leaves opposite elliptical obtuse emarginate serrated

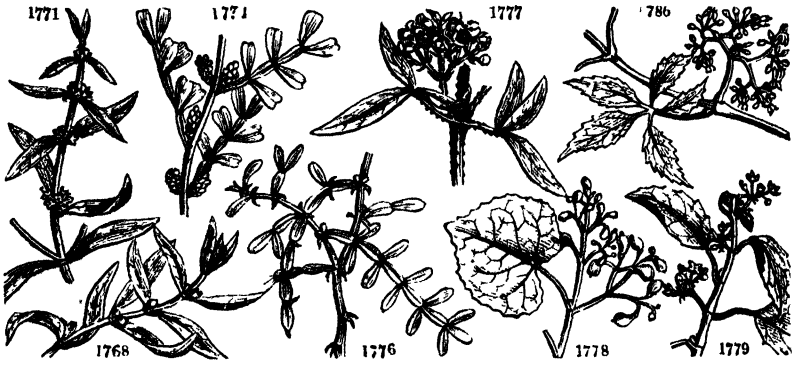
and Miscellaneous Particulars.

social, being always found in quantities Barton says, it is the plant most extensively spread in North America, covering the surface from the 28th to the 69th degree of north latitude.

295 *Oldenlandia* In honor of H B Oldenland, a Dutch naturalist, who travelled in Africa, where he died about the end of the 17th century O umbellata, the chay-root, grows on light sandy ground near the sea, and is much cultivated on the coast of Coromandel for dyeing red, purple, brown, and orange, and to paint the red figures on chintz The coloring matter resides in the bark, which gives it out to water The Malabar physicians say that the roots cure poisonous bites, colds, and cutaneous disorders, and warm the constitution.

296. *Manettia.* In honor of Xavier Manetti, an Italian, and professor of botany at Florence. Some of the species are rather pretty, but they are seldom seen in collections

297. *Epsmedium.* A name of Dioscorides, applied to this little elegant alpine plant, without any assignable reason.



298 *Ptelea.* The Greek name of the elm. It is derived from πτελεα, to fly, in allusion to the winged seed-vessels. A hardy shrub of North America, not unlike a laburnum in foliage, but with small green flowers.

299 *Monetia.* So named by L'Heritier, in honor of the Chevalier Jean Baptiste Monet de la Marck, a celebrated French botanist, now dead, who, unfortunately for botany, many years ago diverted his attention from that science to conchology Cuttings root in sand under a bell-glass, and in bottom heat.

300. *Curtisia.* Named in honor of W. Curtis, lecturer on botany, author of the Botanical Magazine and other works, he died in 1799 This is one of the largest trees of Africa, from which the Hottentots and Caffres make the shafts of their javelins. It has fine broad leaves, but small flowers, which, however, have not yet appeared in this country

301. *Hartogia* Named after John Hartog, a Dutchman, who travelled in Southern Africa and Ceylon The plant called by this name in the gardens is probably only a variety of the common laurel, and nearly as hardy as it. The flowers grow in axillary racemes like bunches of currants.

History, Use, Propagation, Culture,

302 *Ammannia* Named in honor of John Ammann, a native of Siberia, who was a physician and professor of botany at St. Petersburg He published a work upon the plants of Finland, and some papers in the Transactions of the Academy at St Petersburg None of the species have any beauty They may be treated like balsams and other tende. annuals

303 *Fagara* The name of an aromatic plant mentioned by Avicenna The foliage of the present plant has a strong smell of turpentine Cuttings root readily in sand under a hand-glass

304 *Zieria.* So called by Sir J. E. Smith, in honor of his friend Mr Zier, of whom nothing more is known than that he was "a learned and industrious botanist" The species is a pretty greenhouse plant.

305. *Cissus.* The Greek name of the ivy The Latin name *hedera* having been retained for the real plant; the Greek word was given to this genus, which climbs like the ivy The species greatly resemble Vitis in generic character None of them are ornamental, with the exception of C quinquefolia, justly admired for its quinquefid leaves, and the different tints of yellow, red, and purple which these take in autumn It grows rapidly in any soil, and is well adapted for covering naked walls, decorating old unsightly elevations of houses, ruins, cottages, bowers, &c All the species root freely by cuttings in any soil

306 *Cornus* From *cornu*, a horn the wood being thought to be as hard and durable as horn. Its value as a material for warlike instruments has been celebrated by Virgil—*Bona bello cornus* The larger species of this genus are very ornamental and hardy shrubs, not only from their flower and berries of different colors, but by their green, red, purple, or striped barks, which have a fine effect in winter, especially among evergreens. C florida blossoms early, but does not bear berries in this country C mascula, the Cormer of old authors, blossoms still earlier, and bears handsome fruit, which were formerly made into tarts and *rob de cornus* the wood is very hard; and Evelyn says, made into wedges, it will last like iron. C sanguinea, alba, and sericea,

1768 Leaves stem-clasping, Stem square, Branches erect
1769 Leaves lanceolate attenuated at base, Stem branched, Flowers fascicled axillary, Caps. 2-locular
1770 Leaves sessile lanceolate attenuated at base, Flowers axillary clustered, Sepals rigid acute
1771 Leaves somewhat stalked, Caps. larger than calyx colored
1772 Leaves half stem-clasping, Stem square, Branches much spreading
1773 Leaves half stem-clasping linear lanceolate cordate at base, Pedunc. very short many-flowered

1774 Leaves pinnated, Leaflets obovate emarginated, Common footstalk margined jointed unarmed
1775 Leaves pinnated, Leaflets oblong unequal at base crenate
1776 Leaves pinnated, Leaflets wedge-shaped emarginate, Common stalk winged jointed prickly beneath

1777 The only species. It may be known by the stamens being inserted into large glands

1778 Leaves cordate roundish 3-5 lobed angular repand beneath ferruginous
1779 Leaves ovate loosely serrated smoothish, Nerves glandular at base, Petioles and branches pubescent
1780 Branches rounded subpubesc. Petioles with a pubesc. line, Lower lvs simple, middle tern. upper quinate
1781 Leaves ovate serrate toothed, Pedicels and cal hispid glandular
1782 Leaves ovate cordate smooth thickish bristly serrated, Serratures appressed, Branches rounded
1783 Leaves cordate ovate serrated fleshy, Stem 4-cornered winged
1784 Leaves 5 angular toothed beneath ferruginous, Flowers headed
1785 Leaves cordate serrated, Branches very glaucous
1786 Leaves in fives, Leaflets narrowed each way acuminate stalked, Branches rounded knotted smooth
1787 Leaves ternate obovate wedge-shaped fleshy smooth toothed at end entire at base
1788 Leaves ternate rounded hairy toothed, Branches with membranous angles
1789 Leaves quinate, Leaflets undivided ovate serrated
1790 Leaves quinate, Leaflets obovate wedge-shaped serrated above

1 *Flowers in umbels with an involucrum.*

1791 Herbaceous, Branches binate, Umbel axillary stalked, Nerves of leaves distinct
1792 Herbaceous, Branches none, Upper leaves whorled stalked veiny
1793 A tree, Involucr very large colored, Leaflets obcordate
1794 A tree, Umbels as long as involucrum

2 *Flowers in naked cymes.*

1795 Branches upright, Leaves ovate whole-colored, Cymes depressed flat
1796 Branches recurved, Branchl smooth, Leaves broad ovate acute pubesc. hoary beneath, Cymes depressed

1797 Branches sprdg Branchl. woolly, Lvs ovate acum beneath ferrugin Cymes depr woolly, Nuts compr.
1798 Branches warted, Leaves orbicular beneath hoary, Cymes depressed
1799 Branches upright, Leaves ovate whole-colored naked, Cymes panicled
1800 Branches erect, Leaves ovate acuminate smooth hoary beneath, Cyme panicled
1801 Leaves alternate, Stem dichotomously forked

1802 Leaves oblong
1803 Leaves lanceolate

and Miscellaneous Particulars

have fine red twigs, the wood of the first is equal to that of the cornel for hardness, and makes excellent mill cogs, bobbins for lace, toothpicks, and butchers' skewers An oil may be extracted from the berries, by boiling and pressing C sericea from its large leaves, whitish underneath, and its terminating branches of white flowers, is valuable for the shrubbery or lawn All the species may be propagated by seeds, layers, suckers, or cuttings, the second is the most common mode

C sanguinea is very common in woods, and after a smothered combustion, affords a charcoal esteemed the best for entering into the composition of gunpowder. It grows in the shade and drip of other trees, and is therefore a valuable plant for thickening strips of plantations which have become naked below

C succica is called by the Highlanders Lus-a-chrasis, or plant of gluttony, from its berries, which are eaten by the children, being supposed to create an appetite This plant is difficult to preserve in gardens: a bed of peat in a shady situation, and kept moist, is the most suitable for it, or it may be planted in small pots of peat, and treated as an alpine

307 *Santalum* From its Persian name *Sundul-sufed* It is a low tree in habits, leaves and inflorescence a good deal resembling the privet It produces the white and yellow sandal wood of the materia medica, formerly thought to be the produce of different trees. But in India, as in a certain degree in every other country, most trees when large and old, become colored towards the centre, and when the sandal tree becomes large, its centre acquires a yellow color, and great fragrance and hardness, while the exterior part of the same tree that covers the colored part is less firm, white, and without fragrance. It is only the yellow part that is in use, being in universal esteem for its fragrance According to Wathen (*Voy to China*, 1812, p. 116.), it sells so high that the tree is seldom allowed to grow more than a foot in diameter It is manufactured into musical instruments, small cabinets, escrutoires, boxes, and similar articles, as no insect can exist, or iron rust (as it is

History, Use, Propagation, Culture,

said) within its influence It is of the dust of this wood that the Bramins form the pigment which they use in giving the tilac or frontal mark to the God Vishnoo and the oil used in their ceremonies is obtained from the shavings, or at least scented by them. Cuttings root readily in a pot of sand under a bell-glass.

The true sandal wood is the Santalum album, found chiefly on the coast of Malabar, and in the Indian Archipelago

Santalum myrtifolium, which has been confounded with it, is the kind which grows upon the Circar mountains, the wood of which is of little value An amusing specimen of German critical puzzling upon this subject may be seen in Messrs Römer and Schultes, Species Plantarum, vol. iii p 328

306. *Trapa.* Abridged from *calcitrapa*, the Latin name of a dangerous instrument called caltrops, furnished with four spines, which was formerly used in war to impede the progress of cavalry The fruit of this plant is hard, and has four spines also T natans is a curious aquatic, with long brown and green roots and floating leaves, with petioles inflated into a tumour, as in the marine algæ The seed is larger than the kernel of the filbert, with two cotyledons, one large, and the other very small, and not increasing in size during the germination. Hence, Gærtner considers this plant like the Nelumbium, as in a sort of middle state between the monocotyledoneæ and dicotyledoneæ. The nuts are farinaceous, and are esteemed nourishing and pectoral. The skin with the spines being removed, there is a white sweet kernel within, somewhat like a chestnut. They are sold in the market at Venice under the name of Jesuits' nuts. They are also much eaten in Switzerland and the south of France Some of the canals at Versailles are covered with the plant; and Neill informs us (*Hort Tour*), that the nuts are sometimes served up like chestnuts Pliny says that the Thracians made them into bread; and Thunberg states that they (the seed of Trapa bicornis) are commonly put into broth in Japan. In this country the plant is generally kept in a cistern in the stove, and so treated, was fruited by A. B. Lambert, Esq. in 1815, and specimens of the fruit sent to the Horticultural Society

T. bicornis is cultivated by the Chinese in marshes, and the nuts used as food.

309. *Ludwigia.* So named by Linnæus, in honor of C G Ludwig, professor of botany at Leipsic, in the middle of the last century. He left behind him several works which are now almost forgotten. The species are of no beauty.

310. *Cuscuta.* This is a genus of parasitical plants, which fasten themselves to, and draw their nourishment from others. The seed does not split into lobes, but opens and puts forth a little spiral body, which is the em-

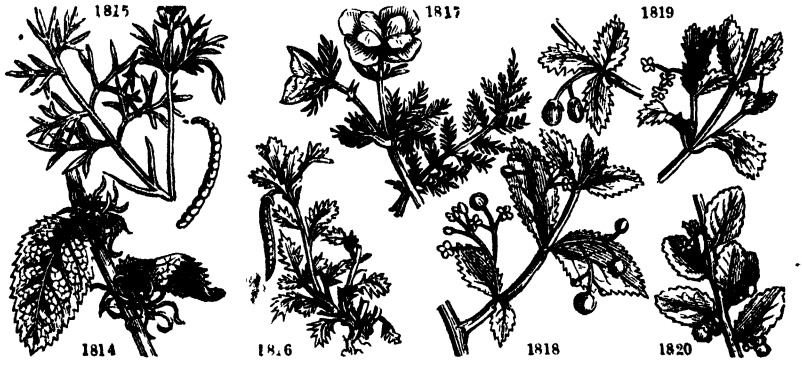
1804 Nuts 4 horned, Spines spreading
1805 Nuts 2 horned

1806 Erect branched smooth, Leaves altern. lanc. hoary beneath, Caps. large crowned with the col. lvs. of cal
1807 Leaves alternate lanceolate, Flowers axillary solitary subsessile, Stem rounded diffuse.

DIGYNIA.

1808 Flowers sessile, Orifice of cor. naked, Stigma acute
1809 Flowers sessile, Stamens with a scale at their base, Stigma acute
1810 A species of which no account has yet been published. Shoots short white
1811 Flowers 5-cleft, Segments oblate rounded, Anthers sessile, Stigmas pileate
1812 All over warted, Color dull brown, Shoots very long

1813 Stem branched at end, Branches erect, Calyx scariose at edge



1814 Leaves obovate acutely toothed cordate with a small sinus

1815 Pods jointed compressed arcuate, Pet 3-lobed the outside smooth at the back
1816 Pods knotty rounded pendulous, Petals smooth the 2 outer ovate oblong pendulous 2 inner 3-parted
1817 Pods not jointed erect compressed, Pet smooth outer wedge-shaped about 3-lobed inner trifid the later al lobes 2-lobed the middle one small

TETRAGYNIA.

1818 Leaves ovate and subcordate acuminate subserrated pubescent
1819 Leaves lanceolate ovate obtuse crenated, Flowers monogynous, Style quadrifid
1820 Leaves elliptical crenated subcoriaceous, Stigmas 2-4 sessile

1821 Leaves ovate acute spiny shining waved, Flowers axillary umbelled

and Miscellaneous Particulars.

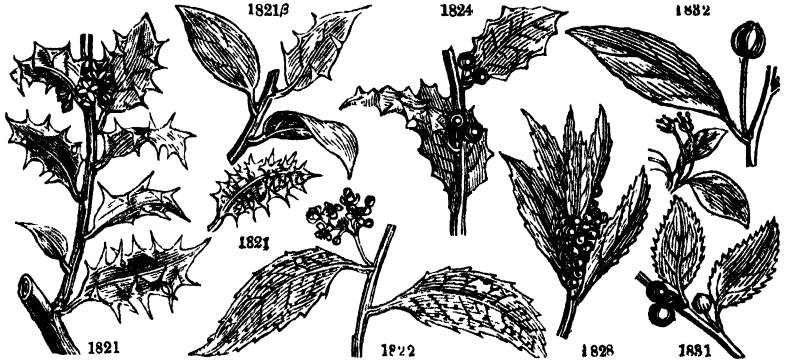
bryo. The stalk twines about some other plant, contrary to the sun's apparent motion, or from right to left, sending out from the inner surface a number of little vesicles which attach themselves to the bark of the supporting plant By degrees, the longitudinal vessels of the stalk shoot from their extremities, and insinuate themselves so intimately with it, that it is easier to break than to disengage them. Plants raised from seed soon die when they have no plant to which they can attach themselves They adhere to the ground by the original root, and draw a part of their nutriment from thence at first, but the original root withers away as soon as the young stem has fixed itself to any other plant

C. europæa may be sown in peat soil by the sides of other plants, in a wild state it is commonly found in hedges, and on hops, brambles, woody nightshade, fern, thistles, hemp, as also on flax, nettles, clover, grass, &c.

C. epithymum will thrive well on any small shrub when once it has got hold. According to Sweet, "it will flower freely, and be very handsome."

C chinensis may be treated like C. europæa

311. *Bufonia.* So named after the celebrated Count de Buffon. It is slender, like the botanical acquirements of that illustrious naturalist.



312. *Hamamelis.* From ἁμα, with, and μηλον, an apple, from the fruit and flowers being on the tree at the same time This is a low tree or shrub, in general appearance resembling the hazel, but it has fine yellow blossoms, which appear in profusion in October or November, and sometimes last till spring. The fruit, which is a small nut, seldom ripens in England.

313. *Hypecoum.* From ὑπηχεω, to rattle, on account of the noise the seeds make in the pods. It is not impossible that Hypecoum procumbens is the Hypecoon of Pliny: the wild cumin of Gerarde. The juice of all the species is yellow, like that of celandine, and is said to have the same effect as opium.

314. *Mygindia.* So named by Jacquin, in honor of Counsellor Mygind of Vienna, a botanical amateur and patron A tree resembling some kind of Ilex.

315. *Ilex.* A word upon which much ingenuity and learning have been tortured in vain. De Théis derives it from *ec*, or *ac*, a point, in Celtic; but that explanation applies better to the specific name Aquifolium. I. Aquifolium is one of our most beautiful shrubs or low trees, displaying either character, according to situation, age, and application of art. It is found in most parts of Europe, and in North America, Japan, Cochin-

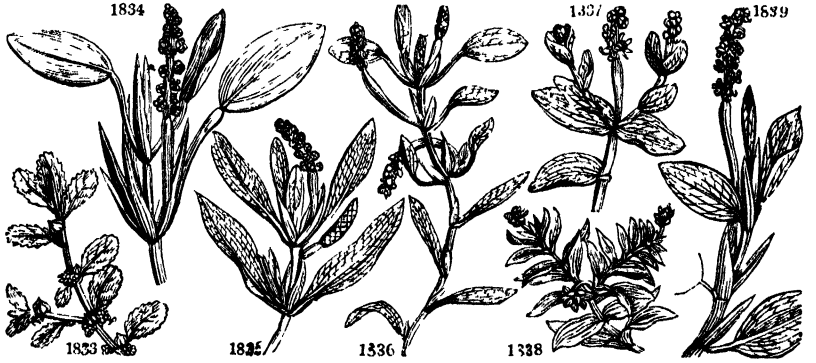
History, Use, Propagation, Culture,

China, &c. In Britain, it is found congregated in natural woods and forests Some of the finest in England, are in Medwood forest, in Staffordshire, and in Scotland, in the woods of Dumbartonshire, about Luss and Lochlomond. Professor Martyn's father first discovered the difference of sexes in the holly, some being male, others female, and others hermaphrodite It is a tree of great longevity, and will grow in any soil not very wet, but best in a dry deep loam, such is the soil of Medwood forest By culture alone, a hundred varieties and subvarieties have been produced, differing in the variegation, margin, and size of the leaves, and in the color of the fruit These make gay and elegant shrubs for lawns and small groups; and form an important feature in the general shrubbery The common green prickly leaved holly makes the best of all hedges, whether we regard its qualities for defence, shelter, duration, or beauty It has one fault, it is very slow of growth unless carefully cultivated, and for this reason hawthorn is preferred It was a very general custom about the end of the 17th century to divide gardens by hedges of this tree, and to keep them exactly shorn Evelyn's impenetrable holly hedge at Deptford has been much celebrated It was 400 feet long, 9 feet high, and 5 feet broad. Gibson, (*Archæologia Brit &c*) who mentions Evelyn's hedge, made a tour of the principal gardens near London, and states, as next in grandeur, that of Sir M. Decker at Richmond · of neither does there exist a single plant The largest holly hedge in Scotland is at Tynningham near Dunbar, planted by a former Earl of Haddington, author of a Treatise on Fruit Trees It has for many years past been left uncut, and now presents a noble phalanx of deep shining green leaves, and numerous spiry tops with spikes of coral berries.

In cultivating the holly, the kernel or stone of the berries is divested of its skin and glutinous pulp, by mixing with sand in heaps in the open garden, and turning over frequently The berries being gathered in November, may be rotted in this way till the October following, and then sown in beds, and covered three quarters of an inch with fine mould, or they may remain on the trees till spring, then gathered and mashed in a tub of water to separate the pulp, after which they may be sown In general, the stones do not vegetate till the second year from the gathering, some will occasionally germinate the first year, and a number not till the third. In transplanting and pruning the holly, the months of October and April are to be chosen: the oftener young plants are removed before planted in the final site the better, as it has naturally but few roots, and those chiefly ramose and descending Miller recommends cutting holly hedges with a knife, as clipping renders them unsightly. The variegated and other curious sorts are generally propagated by budding and grafting on the common green Evelyn says he raised some of the variegated sorts by sowing the seeds, and Miller always found the hedgehog variety continue the same when so propagated. Some raise them by layers, and Sweet says all of them "will root freely by cuttings taken off at a joint in ripened wood, and planted in sand under a hand-glass in a shady situation"



1822 Leaves ovate oblong edge with little cartilaginous scarcely pungent teeth, Corymbs pedunc. dichotomous
1823 Leaves ovate sinuate-toothed slightly spiny, Stipules subulate, Pedunc lax divided
1824 Leaves ovate acute spiny smooth flat, Flowers scattered at the base of the older branches
1825 Leaves oblong serrated, Serratures prickly-ciliated
1826 Leaves ovate with a point unarmed nearly entire
1827 Leaves elliptic-lanceolate acute deciduous serrated, Serratures unarmed
1828 Leaves alternate distant evergreen lanceolate attenuated both ways serrated at the end
1829 Leaves lanceolate elliptical nearly entire reflexed at the edge, Rib villous beneath
1830 Leaves alternate distant evergreen linear lanceolate shining serrated at end, Rib smooth beneath
1831 Leaves alternate distant oblong obtuse crenated serrated, Serratures not prickly
1832 Leaves oblong acuminate subserrated at the end, Pedunc long axillary 1-flowered

1833 Leaves wedge-shaped stalked shorter on one side coarsely sawed and plaited

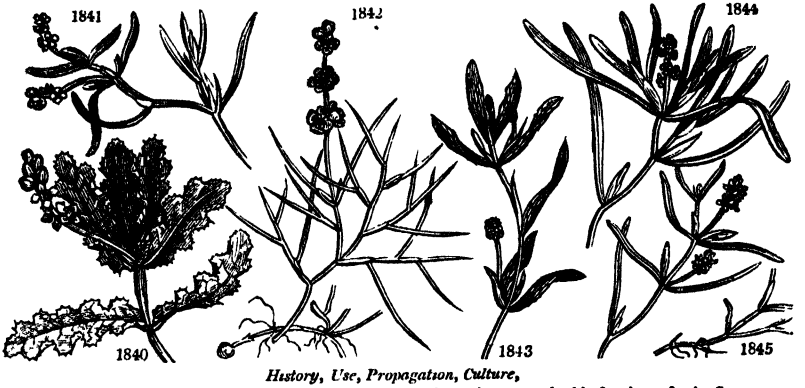
1834 Leaves all elliptical stalked floating, Lower petioles submersed leafless
1835 Leaves floating on long stalks lanceolate ovate narrowed at both ends
1836 Upper leaves stalked elliptical narrowed at both ends the lower close together sessile linear
1837 Leaves cordate stem-clasping all immersed
1838 Leaves ovate acuminate opposite close, Stem dichotomous, Spike 4-flowered
1839 Leaves ovate-lanceolate flat narrowed into the stalks, Spike many-flowered contracted
1840 Leaves lanceolate alternate wavy serrated
1841 Leaves linear obtuse, Stem compressed
1842 Leaves setaceous parallel close together in two rows
1843 Leaves lanceolate membranous flat entire, Spike ovate dense few-flowered
1844 Leaves linear lanceolate alternate sessile broader than their stipule
1845 Leaves linear opposite and alternate narrower than their stipule spreading at base Stem rounded
1846 Leaves lanceolate opposite acuminated

1847 The only species

1848 Branches procumbent smooth, Petals very short
1849 Stem diffuse dichotomous, Leaves spatulate and obovate recurved, Fruit-stalks reflexed

and Miscellaneous Particulars

I cassine and vomitoria have bitter leaves, of which the N American Indians make a tea, which is almost their only physic At a certain time of the year they come down in droves from a distance of some hundred miles, to the coast, for the leaves of this tree, which is not known to grow at any considerable distance from the sea They make a fire on the ground, and putting a great kettle of water on it, they throw in a large quantity of these leaves, and setting themselves round the fire, from a bowl that holds about a pint they begin drinking large draughts, which in a very short time occasion them to vomit easily and freely thus they continue drinking and vomiting for the space of two or three days, until they have sufficiently cleansed themselves, and then every one taking a bundle of the tree to carry away with him, they all retire to their habitations



316 *Coldenia* So named by Linnæus, in honor of Cadwallader Colden, an English naturalist, who published in 1742, an account of the plants of New York

317 *Potamogeton* From ποταμος, a river, and γειτον, near Most of the species grow wholly immersed in water, but like most aquatics, flower above its surface It should seem, Professor Martyn observes, that the respiration of such truly-aquatic vegetables must be as different from those which inhale atmospheric air, as the breathing of fishes is from that of beasts and birds Accordingly, they are, as Haller remarks, of a different texture, pellucid, like oiled paper, very vascular, harsh, and ribbed, but often very brittle, and their surface, like that of aquatic animals, destitute of hair or down of any kind The leaves of aquatic plants afford shade and spawning places to fish, and habitations for aquatic insects and worms for their nourishment. The roots of P natans are a favorite food of the swan, and that bird is in consequence erroneously considered as keeping ponds and lakes clear of all aquatics Ducks eat the seeds and leaves of P crispum Haller informs us, that in the Swiss lakes P serratum grows from ten to twenty fathoms long, forming, as it were, immense woods in the midst of these immense reservoirs. Most of the species may be considered as ornamental in a botanic garden, when kept within bounds or in pots They are readily propagated by seeds or by dividing their long roots, and for the most part, grow best on a clayey bottom

318 *Ruppia* Named after Henry Bernard Ruppi, a German. He published in 1718, a Flora Jenensis It is remarked by Dr Goodenough, that the flower-stalk of this plant is spiral, like that of Valisneria, and relaxes or contracts itself according to the depth of the water The truth is, the flower and leaf-stalks of all aquatics have a power of accommodating themselves to the depth of the water, so as just to emerge above its surface, but the singularity in Ruppia and Valisneria appears to be the employment of a flower-stem for that purpose (See *Valisneria*)

319. *Sagina.* This plant, says Linnæus, is so called for its qualities In Latin, *sagina* expresses something

History, Use, Propagation, Culture,

nourishing The species are very common in dry pastures, where they are valuable for sheep-food. S. procumbens is a small but troublesome weed in shaded garden-walks and paved courts, and with S apetala, seeds the whole summer Curtis remarks, that the latter species ripens its seeds more rapidly than almost any other plant.

Class V. — PENTANDRIA. *5* Stamens.

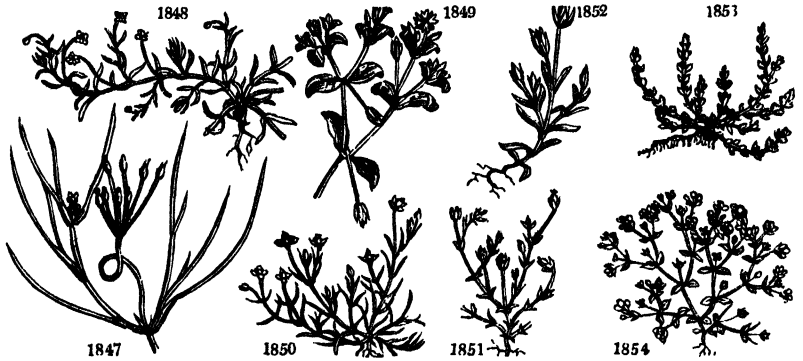
One of the most extensive of the Linnæan classes, and containing about a fifth part of all phænogamous plants It includes the whole of the Boragineæ or Asperifoliæ, Asclepiadeæ, Apocyneæ, and Umbelliferæ, nearly all Primulaceæ, and portions of a great variety of other natural orders, among which many are ornamental, and others valuable on account of their relation to medicine and the arts.

The Boragineæ are, in many instances, ornamental plants, a few, such as Anchusa tinctoria are applied to economical purposes, but the principal part are weeds of northern latitudes. They have been recently described and re-arranged in a scientific manner by M. Lehmann, whose Monographia Asperifoliarum should have a place in every botanical library

The curious genus Stapelia is a part of the Asclepiadeæ, which order was in so unsettled and confused a state as to be a reproach to the science until it was remodelled by Mr Brown, who first determined the just limits of its genera. The Apocyneæ contain, among some poisonous plants, such as Echites venenata, the Oleander remarkable for the beauty of its flowers, and the Cream fruit and Picimmons of Sierra Leone, which are said to be excellent fruit-trees

Umbelliferous plants contain numerous species, some of which, like the Cicuta virosa, Conium maculatum, &c. are dangerous poisons, and others which are useful to mankind either as luxuries or necessaries. The seeds of caraway, coriander, &c are commonly used by the confectioner, of dill and anise by the distiller, the blanched stems of celery and sweet fennel, and the roots and leaves of many others are among the best of British vegetables. The gum galbanum of the shops is said to be the produce of a plant of this tribe Great difficulty exists in ascertaining upon what principles the genera should be divided Linnæus, contrary to his usual practice, attempted to derive the characters from the absence or presence of the involucrum; Hoffman, Link, and Sprengel from peculiarities in the fruit, or, as it is familiarly called, in the seeds The characters of Sprengel, who has, as it were, grown old in the study of Umbelliferæ, are certainly deserving of attention, but botanists are much divided in opinion upon their merits, and, it is to be feared, that notwithstanding the labours of the learned men who have directed their study particularly to the consideration of the order, little real progress has been made in its final arrangement. In this work the arrangement of Sir James Smith has been adopted, as being the most simple of all that has been published, and the most easy of application.

The plants belonging to Primulaceæ are beautiful border-flowers, or pretty alpine plants In the same artificial section with these, are found the elegant families of Convolvulus and Ipomæa, one or several species of which produce the jalap of the shops; the various kinds of Epacris, which in New Holland rival the heaths of Southern Africa, and the splendid genus Azalea.



Other sections include the teak wood of the East Indies, the Sapodilla plum, and the Star apple, fine fruits of the West Indies, solanum, well digested by Dunal, the Jesuit's bark (Cinchona), of which no species has yet been brought alive to Europe, the coffee tree, and many others.

Pentandria Digynia contains little beyond the Asclepiadeæ and Umbelliferæ, already mentioned. The Sumach, Gueldar Rose, and Elder are contained in Trigynia, in Tetragynia the paradoxical and curious Parnassia; in Pentagynia, Crassula, Linum, and Statice, all ornamental genera, and a few obscure weeds make up the last order, Polygynia.

1850 Stem erect pubescent, Flowers alternate apetalous
1851 Stems erect divaricating smooth, Leaves obtuse blunt, Petals obsolete
1852 Stem erect about 1-flowered, Sepals acute, Petals entire

1853 Procumbent, Flowers trifid

1854 The only species

and Miscellaneous Particulars

320 *Tillæa* From Mich. Ang Tilli, an Italian, born in 1653, died in 1740 He was a foreign member of the Royal Society of London, and published a Catalogus Horti Pisani, in one volume, folio
321 *Radiola* A diminution of *radius* A little insignificant weed, formerly referred to the same genus with common flax.

Order 1. MONOGYNIA  5 Stamens. 1 Style.

1. *Flowers monopetalous, inferior. Seed* 1, *naked.*

322 *Mirabilis* Nut below the corolla, which is funnel-shaped. Stigma globose, a little warted.
323. *Abroma* Cor funnel-shaped, with cordate segments, above the germen contracted, at the orifice inflated Stigma simple
324. *Plumbago.* Seed 1 Stamens inserted into the valves. Corolla funnel-shaped. Stigma 5-cleft.

2 *Flowers monopetalous, inferior. Seeds* 2 *or more, naked.*

325 *Heliotropium.* Cal 5-parted Cor hypocrateriform, orifice without teeth, limb 5-cleft, sinuses plaited, simple, or toothed. Stamens included Stigma peltate Nuts 4, cohering without a common receptacle
326. *Myosotis* Cal 5-parted. Cor hypocrateriform, closed with scales Limb 5-parted, obtuse. Stamens included. Anthers peltate. Stigma capitate. Nuts 4, distinct, perforated at the base
327 *Echinospermum* Cal. cor. and other parts as in Myosotis. Nuts united to a central column, prickly, compressed, closed at the base.
328. *Mattia* Cal 5-parted, spreading Cor tubular, funnel-shaped at the orifice with 5 scales as long as the tube Anthers sagittate, conniving, exserted Style longer than stamens. Stigma simple Seeds winged.
329. *Tlarsidium* Cor hypocrateriform, with an angular tube, the orifice contracted with 5 rays Style very short. Stigma capitate. Nuts 4, 2-celled, mitre-formed, cohering, closed at base No common receptacle
330. *Lithospermum* Cal 5-parted, persistent Cor. funnel-shaped, with a half 5-cleft obtuse limb, and an open orifice. Anthers included. Stigma obtuse, bifid. Seeds 4, hard, smooth, closed at the base.
331. *Batschia.* Cal. deeply 5-parted. Cor. hypocrateriform, with a hairy ring at the base inside, an open orifice, and rounded segments Stigma emarginate. Seeds hard, shining
332. *Onosma* Cal 5-parted, erect. Cor campanulate, funnel-shaped, with a ventricose tubular 5-toothed limb, and an open orifice. Anthers sagittate, connected at base by their lobes. Stigma obtuse. Seeds ovate, shining, stony, closed at base
333. *Anchusa.* Cal. 5-cleft, persistent. Cor funnel-shaped, with a half 5-cleft spreading limb, orifice closed with 5 prominent scales. Anthers included Stigma emarginate Seeds gibbous, with a sculptured surface
334. *Symphytum.* Cal 5-parted, acute. Cor cylindrical, campanulate, with a short tube and a tubular inflated limb, orifice with 5 subulate rays conniving into a cone. Stigma simple Seeds gibbous, not pierced at base.
335. *Onosmodium.* Cal deeply 5-parted. Cor oblong, campanulate, with a ventricose hair 5-cleft limb, the edges of which are inflated, orifice open Anthers sagittate, included.
336. *Cynoglossum.* Cal. 5-parted. Cor short, funnel-shaped, with a 5-parted obtuse limb; orifice closed by scales. Stamens included. Stigma capitate Nuts depressed, attached to a central column
337. *Omphalodes.* Cal. deeply 5-parted. Cor. rotate, shorter than the tube of the calyx, with 5 short scales crossing over the anthers, which are inserted into the base of the tube. Style short. Stigma thick. Seeds urceolate, toothed at the edge
338. *Pulmonaria.* Cal. prismatic, 5-cornered, 5-toothed. Cor. funnel-shaped, with a cylindrical tube, open orifice, and obtuse 5-lobed limb. Stigma obtuse. Seeds 4, obtuse, rounded.
339. *Cerinthe* Cor tubular, ventricose. Nuts 2, each 2-celled, open at the base.
340. *Borago.* Cal. 5-parted. Cor. rotate, with acute segments, orifice crowned Filaments conniving Seeds rounded, closed at base, rugose, inserted lengthways into an excavated receptacle.

341. *Trichodesma* Cor rotate, with a naked orifice and subulate segments. Stamens exserted. Anthers villous at back. Nuts half immersed in the 4-winged column

342. *Asperugo* Cal 5-parted, irregular Cor funnel-shaped, with a short tube, orifice closed by convex scales. Stigma obtuse Seeds oblong, compressed, not perforated

343. *Nonea.* Cal. at length inflated Cor funnel-form, with a 5-cleft short limb, and straight naked tube. Stamens included. Orifice nearly open Seeds 4, with parallel streaks

344. *Lycopsis* Cor funnel-shaped, 5-lobed, with a covered tube and obtuse limb Scales at the orifice Stigma emarginate. Nuts hollowed at base

345. *Echium* Cal 5-parted, subulate Cor campanulate with unequal obtuse segments, the 2 upper the longest, orifice open. Filaments unequal, declinate Stigma obtuse Seeds roundish, warted, not open at base

346. *Tournefortia.* Berry 2-celled, cells 2-seeded, perforated at end. Cor hypocrateriform or rotate, naked at the orifice.

347. *Nolana* Cal turbinate Cor campanulate, plaited Nuts 5, 2 or 4-celled

3. *Flowers monopetalous, inferior Seeds in a capsule or dry drupe (Vesta, which has a berry, is an exception, but is placed here on account of its relation to other genera)*

348 *Aretia* Caps 1-celled Corolla hypocrateriform, contracted at the orifice Stigma globose
349 *Androsace* Caps 1-celled Corolla hypocrateriform, contracted at the orifice Stigma globose.
350. *Primula* Caps 1-celled Corolla funnel-shaped, pervious at the orifice Stigma globose
351 *Cortusa* Caps 1-celled, oblong Corolla rotate Stigma somewhat capitate
352 *Soldanella* Caps 1-celled Corolla torn Stigma simple
353. *Dodecatheon* Caps 1-celled, oblong Corolla reflexed Stigma obtuse
354 *Cyclamen* Caps 1-celled, pulpy within Corolla reflexed Stigma acute
355 *Hottonia* Caps 1-celled Corolla with the tube below the stamens Stigma globose.
356 *Lysimachia* Caps 1-celled, 10-valved Corolla rotate Stigma obtuse
357 *Anagallis* Caps 1-celled, cut round Corolla rotate Stigma capitate
358 *Diapensia* Caps 3-celled Corolla hypocrateriform Cal 8-leaved
359 *Pyxidanthera* Cal deeply 5-parted Cor campanulate, much shorter than the tube of calyx, segments 5, spatulate Anthers with an appendage at their base Style thick Stigmas 3
360. *Coris* Caps 1-celled, 5-valved Corolla irregular Stigma capitate
361 *Galax* Caps 1-celled, 2-valved Corolla hypocrateriform Stigma roundish
362 *Menyanthes* Caps 1-celled Corolla villous spreading Stigma bifid Cal 5-parted
363 *Villarsia* Caps many-seeded, 2-valved. Cor rotate, limb spreading, 5-parted, flat, bearded or scaly at the base Glands 5, hypogynous
364 *Chironia* Caps ovate, seeds numerous small Cal 5-parted erect Cor equal, with a 5 parted limb of ovate equal segments Filaments from mouth of tube Anthers, after bursting, spiral Style declinate
365 *Eustoma* Cal deeply 5-cleft Tube of cor funnel-shaped, contracted Filam short, regular, inserted about the middle of the tube Stigma large, deeply 2-lobed Seeds scurfy
366. *Erythræa* Caps linear Cal 5-cleft Cor funnel-shaped, with a short limb withering Anthers, after bursting, spiral. Stigmas 2
367 *Sabbatia* Cor with an urceolate tube, and limb 5-12-parted Stigmas 2-parted, with spiral divisions Anthers at length revolute
368 *Loganea.* Caps 2-parted. Cor subcampanulate, with a villous throat, and 5-parted limb. Stigma clavate
369 *Phlox* Caps 3-celled Corolla hypocrateriform, with a curved tube Stigma trifid
370 *Polemonium* Caps 3-celled Corolla 5-parted Stamens placed on the valves
371 *Vesta* Berry Cor funnel-shaped, 5-parted, with a hairy throat Stamens exserted Stigma nearly entire
372 *Hydrophyllum* Caps 1-celled, 2-valved Corolla with 5 nectaries Stigma bifid
373 *Phacelia* Caps 2-valved, 4-seeded Cal persistent Cor campanulate, 5-cleft, with 5 furrows inside the base Stam exserted Style short Stigmas 2, long
374 *Ramondia* Caps 2-valved, valves bent in at edge, septiferous Cor rotate, rather unequal. Stamens approximated, perforated at end Stigma round
375 *Verbascum* Caps 2-celled Corolla rotate Stigma obtuse Stamens declinate.
376 *Datura* Caps 2-celled, 4-valved Corolla funnel-shaped Calyx deciduous
377 *Brugmansia* Caps unarmed Cal bursting at side, persistent Cor funnel-shaped Anthers glued together Stigma or line running down each side of style
378 *Lasianthus* Caps 2-celled, many-seeded Corolla funnel-shaped, ventricose Style persistent
379 *Spigelia* Caps 2-celled, double Corolla funnel-shaped Stigma simple
380 *Nicandra* Berry without juice, 3-5-celled, covered by the calyx, which is inflated Cor campanulate. Stamens incurved, distant
381 *Hyoscyamus* Caps 2-celled, with a lid Corolla funnel-shaped Stigma capitate
382 *Nicotiana* Caps 2-celled Corolla funnel-shaped Stigma emarginate
383 *Ipomœa* Caps 3-celled Corolla funnel-shaped Stigma capitate
384 *Convolvulus* Caps 2-celled, 2-seeded Cor campanulate Stigma 2-cleft
385 *Argyreia* Berry rounded, juiceless, 4-celled Cal colored, persistent, the outer sepals largest Cor 5-parted, with a short thick tube surrounding the nectary Stamens in the mouth of tube thickened, at base hairy Anthers sagittate
386 *Nemophila* Ovary 1 celled, with 2 parietal placentas, each bearing 2 distant ovules Capsule 1-celled, with fleshy placentas fixed to a longitudinal dorsal axis, otherwise loose, bearing the seeds on their inner surface
387 *Calystegia* Ovary half 2-celled, 4-seeded Cal 5-parted, inclosed in two leafy bractes Cor campanulate, 5-plaited Stamens nearly equal, shorter than the limb Stigmas 2, obtuse
388 *Cobœa* Caps obovate, 3-5-celled, 3-5-valved Seeds imbricated, edged Cal 5-cleft, campanulate, 5-cornered, winged Cor campanulate, with 5 blunt lobes Stamens declinate, filaments spiral
389 *Cantua* Caps 3-celled, 3 valved Seeds winged Corolla tunnel-shaped Stigma trifid
390 *Hoitzia* Caps of Cantua Seeds not edged Cal double, inner 1-leaved, tubular, outer of 4-8 leaves. Cor funnel-shaped, 4-5 times as long as calyx, a little incurved. Stamens inserted into base of tube
391 *Retzia* Caps 2-celled Corolla cylindrical, villous on the outside Stigma bifid
392. *Lubinia* Caps many-seeded, mucronate, when pressed of 2-4 valves. Cal 5-parted Cor. hypocrateriform, with a flat 5-parted equal limb Filaments attached to middle of tube Stigma obtuse
393 *Epacris* Caps with placentas attached to a central column Cal colored, with many bracteæ Cor. tubular, with a beardless limb Stamens on the petals Scales 5, hypogynous
394 *Styphelia* Drupe juiceless, with a solid bony putamen Cal 5-parted, with many bracteæ. Cor. in a long tube, having within 5 bundles of hairs, and bearded reflexed segments Filaments exserted
395 *Lissanthe* Drupe berried, with a bony solid putamen Cal with 2 bracteæ or more. Cor infundibuliform, not bearded Ovarium 5 celled
396. *Astroloma* Drupe juiceless, with a solid bony putamen Cal with 4 or more bracteæ. Cor ventricose, twice as long as calyx, with 5 bundles of hairs inside, and a short spreading bearded limb Filaments linear included.
397. *Sprengelia* Caps with placentas attached to a central column Cal. colored Cor 5-parted, rotate, beardless. Stamens hypogynous Anthers connate or not No hypogynous scales
398. *Andersonia.* Caps of Sprengelia. Cal colored, with 2 or more leafy bracteæ Cor. the length of the

calyx, the segments of the limb bearded at the base. Stamens hypogynous. Scales 5, hypogynous, sometimes connate.

399 *Lysimema.* Caps of Sprengelia. Cal colored, with many bracteæ Cor hypocrateriform, with a tube sometimes 5-partible, with beardless segments bent to the right Stamens hypogynous Scales 5, hypogynous.

400 *Monotoca.* Drupe berried. Cal. with 2 bracteæ Cor funnel-shaped, with the limb and throat beardless. Ovary 1-seeded.

401. *Leucopogon.* Drupe berried or juiceless, sometimes crustaceous Cal with 2 bracteæ. Cor funnel-shaped, with a spreading limb bearded lengthwise Filaments included. Ovary 2-5-celled

402. *Stenanthera.* Drupe juiceless, with a solid bony putamen Cal with many bracteæ Cor. tubular, longer than the calyx, ventricose, with a short spreading half-bearded limb. Filaments included, fleshy, broader than the anthers.

403. *Azalea.* Caps. 5-celled. Corolla campanulate Stigma obtuse

404. *Chamæledon.* Caps. 2-celled, opening at the end. Cal 5-parted, equal Cor campanulate, 5-cleft, unequal. Stamens inserted into the base of cor. equal, straight, included. Anthers opening lengthwise Style straight.

405. *Brexia* Cal. short, with 5 rounded lobes Petals ovate, spreading, rounded Filam dilated at base Bristles shorter than the stamens, about the ovarium

406 *Ophiorhiza* Caps. 2-celled, 2-parted. Corolla funnel-shaped, villous at mouth, with acute segments Stigma bifid.

407. *Allamanda.* Caps. 1-celled, lens-shaped, 2-valved, the valves being boat-shaped Seeds imbricated.

408 *Theophrasta* Caps 1-celled, very large Corolla campanulate Stigma acute

409 *Clavija* Caps 1-celled, very large. Corolla rotate, with 5 prominences in the centre. Filaments 5, united into a tube at the base of the corolla.

4. Flowers monopetalous, inferior Seeds in a follicle

410 *Vinca* Cal 5-cleft. Cor hypocrateriform, plaited at the orifice, with flat segments, truncate at the end Filaments at the end dilated into concave scales Glands 2 at base of ovary

411. *Nerium* Cor hypocrateriform, crowned at the mouth with little lacerated appendages, segments of cor twisted. Filaments inserted into middle of tube Anthers sagittate, adhering to the stigma by the middle Little teeth at the base of the calyx outside the corolla

412 *Wrightia* Cor. hypocrateriform Mouth crowned by 10 divided scales Stam exserted Filaments inserted into throat. Anthers sagittate, adhering to the stigma by the middle Scales 5-10, inserted into base of calyx outside of corolla, some hypogynous

413 *Echites* Cor hypocrateriform, with segments of the limb unequal-sided Ovaries 2 Style 1, filiform Follicles slender

414 *Ichnocarpus* Cor hypocrateriform, with segments of limb halved Ovaries 2 Style 1, filiform Stigma ovate, acuminate. Filaments 5, hypogynous, alternate with the stamens

415 *Plumeria* Cor funnel-shaped, with a flat limb, and ovate-oblong oblique segments Filaments from the middle of tube Anthers conniving Styles scarcely any

416 *Strophanthus* Cor. funnel-shaped, with segments caudate, mouth crowned with 10 entire scales Stam inserted into middle of tube. Anthers sagittate, aristate, or mucronate Style filiform, dilated at end. Stigma cylindrical

417. *Cameraria* Cal very small. Cor funnel-shaped or hypocrateriform, with a long tube inflated at both ends, and a flat limb, with 5 lanceolate oblique segments Filaments in the middle of tube Ovaries, with appendages at their sides Styles scarcely any

418 *Tabernæmontana* Cor hypocrateriform. Stamens included Anthers sagittate Ovaries 2 Style filiform Stigma dilated at base, bifid. Seeds immersed in pulp

419. *Amsonia* Cor funnel-shaped, closed at the orifice, with a 5-lobed limb Stigma capitate, surrounded by a membranous angle. Seeds obliquely truncate, naked.

5. Flowers monopetalous, inferior Seeds in a drupe or berry

420 *Cerbera* Cal persistent, 5-parted Cor funnel-shaped, with a clavate tube and 5-cornered throat, with 5 scales, segments of limb oblique obtuse. Stigma fringed, bifid Drupe bony, 2-celled, 4-valved. Seeds 1 2, covered with a fleshy skin

421. *Tectona.* Cal. campanulate, with 5-6 lobes Cor funnel-shaped, the length of calyx, with a short tube, and 5-6-parted crenulate limb Stamens under the throat of corolla. Drupe globose in the inflated calyx, 3-4-celled

422 *Caldasia* Cal tubular Cor tubular, 2-lipped, with emarginate segments Filaments declinate Drupe 3-angular, 3-valved, 3-seeded.

423 *Bumelia* Cal 5-parted, very small Cor campanulate, 5-cleft, or hypocrateriform, with teeth between the divisions of limb Nectary a 5-leaved crown, adhering to the tube of the corolla Drupe ovate or globose

424 *Chrysophyllum.* Cal 5-parted, small Cor campanulate, short Filaments on the tube connivent Style very short Stigma obtuse, 5-cleft Berry 10-celled, with solitary shining seeds

425 *Sideroxylon* Cal. 5-toothed. Cor 5-cleft Scales of nectary five Stigma simple Berry 5-seeded

426. *Jacquinia.* Cal 5-leaved Cor with a campanulate ventricose tube, and 10-cleft limb Stamens hypogynous. Anthers hastate • Stigma capitate Berry roundish, 1-celled, 1-seeded

427. *Achras* Cal. 5-6-parted. Cor ovate, 5-6-cleft, with as many scales on the throat. Berry or apple teated, 1-celled Seeds solitary, with a marginal hilum, and a claw at the end

428. *Cordia* Cal tubular, 4-5-toothed Cor funnel-shaped, 4-5-cleft Style dichotomous Stigmas 4 Drupe covered by the calyx, 1-4-celled Cotyledons plaited.

429. *Varronia.* Cal tubular, 5-toothed Cor tubular, with a 5-cleft, spreading, plaited limb Style dichotomous. Stigmas 4 Drupe 4-celled, 4-seeded

430. *Ehretia* Cal. deeply 5-cleft Cor funnel-shaped, with a naked throat. Stamens exserted Style semibifid. Berry 2-celled, 2-seeded.

431. *Bourreria* Cal. campanulate, half 5-cleft, very small Cor longer than calyx, with a plaited limb Stam. as long as cor Stigma obtuse edged Berry roundish, 1-celled, with 4 convex seeds

432. *Ellisia* Cal 8-parted Cor funnel-shaped Stam inserted in base of corolla. Stigma simple or bifid Berry dry, scrotiform, 2-valved, 2-celled, in an enlarged stellate calyx Seeds globose, black, dotted.

433. *Sersalisia* Cal 5-parted. Cor 5-cleft Stamens 5, sterile, scale-like, with as many alternate fertile ones. Ovary 5-celled. Stigma undivided. Berry 1 5 seeded Seeds with a crustaceous skin, and longitudinal hilum.

434. *Mangifila.* Cal. very small, 5-parted Cor. rotate, 5-parted. Scales of nectary none Drupe or berry 1-celled, 1-seeded.

435. *Ardisia* Cal. 5-parted. Cor hypocrateriform, with a reflexed limb. Anthers large, erect. Stigma simple Drupe fleshy, superior, 1-seeded.

436 *Arduina* Cor funnel-shaped, curved Stigma bifid Berry 2-celled. Seeds solitary, oblong.

437 *Strychnos.* Cor tubular, 5-cleft Berry 1-celled, with a woody coat A Contorta

438. *Carissa* Cal. short. Cor. tubular Stamens included Berry 2-celled. Cells 1-2 or many-seeded A Contorta.

439. *Pæderia* Cal 5-toothed. Cor. infundibuliform, 5-lobed, hairy within Style bipartite Berry brittle, shining, 2-seeded

440. *Gelsemium* Cal. 5-toothed. Cor. infundibuliform Limb spreading, 5-lobed, nearly equal Caps. compressed, flat, 2-partible, 2-celled. Seeds flat, attached to the margins of the valves

441. *Rauwolfia.* Cor. tubular, globose at base Berry succulent, 2-seeded. A Contorta.

442. *Vallesia.* Cal. very small, 5-fid. Cor hypocrateriform, or infundibuliform, with a long slender tube, an inflated throat, and a flat limb with 5 lanceolate spreading segments. Stamens inserted in the throat. Drupes 2, 1-celled, 1-seeded. Nut fibrose, striated.

443. *Bæobotrys.* Cor tubular, 5-cleft. Calyx double, superior: outer 2-leaved, lower campanulate, 5-toothed. Berry 1-celled, many-seeded.

444 *Solandra.* Cal. bursting Cor. clavate, funnel-shaped, very large. Berry 4-celled, many-seeded.

445. *Centrum.* Cal. funnel-shaped. Segments acute, edged. Stamens with or without a tooth. Anthers 4-cornered. Berry 1-2-celled. Seeds few, angular.

446. *Atropa.* Cor. campanulate Stamens distant. Berry globose, 2-celled, sitting on the calyx.

447 *Mandragora.* Cal. turbinate. Cor campanulate. Filaments dilated at base. Ovary with 2 glands. Berry fleshy, solid. Seeds reniform

448. *Physalis* Cor campanulate, rotate. Stamens conniving. Berry within the inflated calyx, 2-celled.

449. *Saracha.* Cor rotate, campanulate. Berry 1-celled. Receptacle fleshy.

450 *Lycium.* Cor tubular, with a closed orifice Filaments bearded. Berry 2-celled, many-seeded.

451. *Solanum.* Cal persistent. Cor rotate or campanulate, 5-lobed, plaited. Anthers in some degree united, opening by a double pore at the end Berry 2-celled, many-seeded.

452. *Nycterium.* Cal 4-5-cleft. Cor. rotate, unequal. Anthers declinate, conniving, the lowest longest. Berry 2-celled, many-seeded

453. *Capsicum* Cor rotate Berry without juice.

454 *Lecа* Cor monopetalous Nectary 1-leaved, placed on the tube of the corolla, 5-cleft, erect. Berry 5-seeded, inferior.

6. *Flowers monopetalous, superior Seeds in a capsule.*

455. *Spermadictyon.* Caps inferior, 1-celled, 5-valved. Seeds 5, with a netted coat. Cor. funnel-shaped. Stigma 5-cleft.

456. *Dentella.* Cal 5-parted, superior Cor. funnel-shaped, with 3-toothed divisions. Caps. 2-celled, many-seeded.

457 *Macrocnemum* Cal. campanulate, cup-shaped. Cor campanulate or funnel-shaped. Caps. 2-celled. Seeds imbricated.

458. *Exostemma.* Cal campanulate, 5-toothed. Cor funnel-shaped Limb 5-parted, usually hairy. Caps. oblong, rounded, 2-celled, 2-partible Seeds numerous, with a membranous edge.

459 *Burchellia.* Heads of flowers in an involucrum Cor clavate, funnel-shaped, with a 5-cleft short limb and a beardless orifice. Segments before expansion twisted together Stamens inserted above the middle of the tube. Anthers subsessile, included. Stigma clavate. Berry crowned by the deeply 5-cleft calyx, 2-celled, many-seeded.

460 *Rondeletia.* Cor funnel-shaped Tube ventricose at top Segments rounded, flattish. Caps. round, crowned, 2-celled. Seeds several or solitary

461 *Coutarea.* Cal 6-leaved Cor. large, funnel-shaped, 6-cleft, with an incurved ventricose tube Filaments inserted at base of tube. Caps. 2-celled, 2-valved, many-seeded Seeds with a membranous edge.

462. *Portlandia.* Cal 5-leaved Cor clavate, funnel-shaped. Segments spreading, deflexed. Caps. 5-cornered, retuse, crowned, 2-celled, 2-valved. Valves doubled, 2-cleft, many-seeded.

463 *Campanula* Cor campanulate, closed at bottom with staminiferous valves. Stigma 3-5-cleft. Caps. inferior, opening by lateral pores

464 *Lobelia* Cor with the tube split on one side, the limb 2-lipped, 5-parted. Stigma 2-lobed, sometimes entire. Caps. 2-3-celled, 2-valved at end

465 *Phyteuma* Cor at first rounded conical, afterwards 5-parted with linear weak segments. Stigma 2 or 3-cleft. Caps. 2-3-celled, inferior

466 *Trachelium* Cor funnel-shaped. Style long Stigma globose Caps 3-celled, inferior.

467 *Roella* Cor funnel-shaped, closed at bottom with staminiferous valves. Stigma 2-fid. Caps. nearly 2-celled, cylindrical, inferior.

468 *Goodenia* Cor. labiate, 5-cleft, waved, longitudinally split, pushing forth the stamens. Anthers linear. Stigma urceolate, ciliated. Caps 1-2-celled, 2-valved, many-seeded. Seeds imbricated.

469 *Euthales.* Cal tubular, 5-cleft, equal Cor split at the end, with a 2-lipped limb Anthers distinct. Style undivided. Stigma 2-lipped. Caps 4-valved, 2-celled at base

470 *Dampiera* Cor 2-lipped Tube split on one side Segments of upper lip with an auricle upon the inner edge Anthers cohering Covering of stigma naked

471 *Samolus* Cor hypocrateriform, 5-cleft, with scales between the divisions Stamens inserted into the tube Caps. 1-celled, 5-toothed, many-seeded.

472. *Velleia* Cal 3-5-leaved, unequal. Tube split at end with a 2-lipped limb. Anthers distinct. Style undivided. A gland between the two front stamens

7 *Flowers monopetalous, superior Seeds in a drupe or berry.*

473 *Scævola* Cor 1-petalous, with the tube divided lengthwise Limb 5-cleft, lateral. Drupe inferior, 1-seeded. Nect. 2-celled.

474 *Caprifolium.* Cal. 4-5-toothed or entire Tube of cor long, with a 5-cleft, regular, or 2-lipped limb. Stamens length of cor Stigma globose Berry distinct, 3-celled, many-seeded.

475 *Lonicera* Ca 5 toothed. Cor tubular, 5-cleft, irregular Berry inferior, 2-3-4-celled, many-seeded.

476. *Symphoria* Cal 4-toothed. Cor trifid, nearly equal Berry crowned, 4-celled, 4-seeded, 2 cells sometimes abortive

477 *Diervilla* Cal oblong, 5-cleft. Cor. twice as long, funnel-shaped, 5-cleft, spreading Caps oblong, 4-celled, many-seeded

478 *Triosteum* Cal 5-cleft. Cor scarcely longer, tubular, 5 lobed. Berry 3-celled, 3-seeded, inferior.

479 *Coffea* Cal increasing, 5-toothed, teeth deciduous. Cor hypocrateriform. Stamens above the tube Anthers sagittate Berry 2-seeded Seeds with an arillus, on one side convex, on the other flat

480 *Chiococca* Cor funnel-shaped, equal Berry compressed, double, 2-seeded. Seeds oblong, compressed.

481 *Serissa* Cor funnel-shaped, fringed at the throat, with segments of the limb 3-lobed. Berry 2-seeded.

482. *Canthium* Cal 5-cleft Cor 5-cleft, spreading Style elevated. Stigma capitate. Berry coated, 2-celled, 2-seeded Seeds on one side convex, on the other flat, with a longitudinal furrow. Prickly.

483 *Psychotria.* Cal 5-toothed, crowning Cor funnel-shaped. Berry globose or oval. Seeds 2, furrowed, bony.

484. *Hamelia* Cor 5-cleft Berry 5-celled, many-seeded. Racemes divided Flowers 1-sided.

485. *Posoqueria* Cal turbinate Cor hypocrateriform, with a long cylindrical curved tube which is dilated at end, with long narrow reflexed segments Stamens exserted

486. *Vanguera* Cor. campanulate, globose, with a hairy throat. Stigma of 2 lips. Berry apple-shaped, 4-5-celled, 4-5-seeded.

487. *Gardenia.* Segments of the cal. vertical or oblique Cor at first twisted, funnel-shaped, 5-9-cleft, with a tube usually long Style elevated Stigma 2-lobed Berry 2-celled, many-seeded. Seeds in a double row

488. *Genipa.* Cal. tubular or turbinate, entire Cor hypocrateriform, with a large 5-parted limb. Anthers sessile in the throat, exserted Stigma clavate, entire, or simple Berry large, fleshy, truncated at the end, 2-celled, many-seeded.

489. *Oxyanthus* Cal contracted at top Cor funnel-shaped, with a very long rounded tube, and a 5-parted limb, with very acute lobes. Anthers exserted.

490. *Randia.* Cal. 5-parted, with linear-lanceolate, twisted sepals Cor hypocrateriform, tube not much longer than calyx. Stigma 2-lobed, with oblong unequal lobes Berry half 2-celled, with an incomplete partition; crowned with the tubular calyx. Seeds many.

491. *Hedyosmia.* Cor. funnel-shaped. Stigmas 2, thickish. Berry oblong, 2-celled, many-seeded. Seeds in 4 rows. Stamens in the inside of the tube.
492. *Pinckneya.* Sepals unequal, one or two of them foliaceous. Cor. a long tube. Filaments in the base of the tube. Caps 2-valved, valves bearing the divisions in the middle
493. *Erithalis.* Cal. urceolate. Cor 5-parted, with recurved segments Berry 10-celled, 10-seeded.
494. *Webera.* Cor. funnel-shaped, spreading. Stamens included. Stigma clavate. Berry rounded, two-celled.
495. *Plocama.* Cal. 5-toothed. Cor. campanulate, 5-cleft. Berry 3-celled, with 1-seeded cells.
496. *Morinda.* Flowers collected in a globe above a spherical receptacle. Cal. 5-toothed. Cor. funnel-shaped, 5-cleft, spreading. Berries aggregate, on account of their mutual compression angular.
497 *Cephaelis.* Flowers headed in an involucrum Cal. 5-toothed. Cor tubular Stigma 2-parted. Berry 2-seeded. Receptacle chaffy. Involucrum 1-5-leaved.
498. *Sarcocephalus.* Flowers in a naked head, 5-parted. Stigma clavate. Fruit united into a great fleshy tessellated berry.

8. *Flowers polypetalous, inferior Seeds in a drupe, berry, or berried capsule.*

499. *Hirtella* Pet. 5. Filam. very long, persistent, spiral Berry 1-seeded Style lateral.
500. *Triphasia.* Flowers with their parts ternary. Stamens distinct. Anthers sagittate. Berry 3-celled 3-seeded.
501 *Vitis* Petals cohering at the end like a calyptra, withering Berry 5-seeded
502. *Ampelopsis* Cal entire. Petals cohering at the end, withering. Stigma capitate. Ovary immersed in the disk, 2-4-seeded
503. *Rhamnus* Cal campanulate, 4-5-cleft. Cor. scales protecting the stamens, inserted into the calyx. Stigmas 1-2-5-cleft. Berry 3-4-seeded
504. *Œnoplia* Cal. urceolate, 5-cleft. Petals 5. No fleshy discus. Drupe juicy, 2-celled, one cell being usually abortive, 1-seeded.
505 *Paliurus* The flowers of Zizyphus Styles 3. Drupe dry, 3-celled, surrounded by a membranous orbicular wing
506. *Zizyphus.* Cal spreading, 5-cleft Petals 5 Discus fleshy, orbicular, surrounding the ovary. Styles 2. Drupe with a 1 or 2-seeded nut. Flowers axillary
507 *Celastrus* Cor 5 petals, spreading Caps 3, angular, 3-celled. Seeds with an arillus
508. *Senacia.* Cal. very small, 5-toothed. Cor. 5 petals Caps spherical, stalked, 2-valved, 4-seeded. Seeds angular, naked.
509. *Euonymus.* Pet. 5. Caps 5-cornered, 3-celled, 3-valved, colored Seeds with an arillus
510 *Ceanothus* Pet 5, bagged, vaulted Berry dry, 3-celled, 3-seeded.
511 *Staavia.* Flowers aggregate. Stamens inserted into the calyx. Styles 2, united. Berry 5-seeded, coated. Receptacle chaffy, villous.
512. *Pomaderris* Cal turbinate. Petals arched, scale-like, sometimes none. Style 3-cornered. Stigmas 3, capitate. Caps of 3 papery divisions
513. *Mangifera* Pet 5 Drupe reniform
514. *Schrebera* Drupe dry, with a 2-celled nut Nectary an elevated edge
515. *Billardiera.* Petals 5, alternate with the sepals. Nectary O Stigma simple Berry many-seeded
516. *Elæodendrum* Sepals 5-10, with round concave scales Cor 5-parted Segments ovate, lanceolate, concave. Nect linear, subulate, petal-like Drupe dry, with a 2 or 3-celled nut Putamen thick, hard, furrowed.

9 *Flower polypetalous, inferior. Seeds in a capsule*

517 *Diosma.* Cal 5-parted. Petals and stamens inserted in the calyx Nect of 5 plaits. Ovary crowned. Caps. 5-valved. Each end with an elastic arillus
518. *Adenandra.* Cal. 5-parted. Pet and stamens inserted in the calyx. Stamens 10, of which every other one is sterile Anthers with a gland at end.
519. *Baryosma.* Cal. 5-leaved. Petals 10, unequal, inserted in the receptacle Nect. a 5-lobed gland inserted on the receptacle
520. *Agathosma.* Cal. 5-parted. Petals 10, unequal, inserted in the calyx Nect 5-lobed, inserted in calyx.
521. *Nauclea* Cal. about 5-toothed. Cor funnel-shaped. Caps. 3-cornered, 2-celled, many-seeded. Flowers in a globose head upon a common pilose receptacle
522. *Pittosporum.* Cal. deciduous Petals 5, conniving in a tube Caps 2-5-celled, 2-5-valved. Seeds pulpy
523. *Lasiopetalum.* Cal 5-leaved. Petals minute, gland-like. Filaments 5, separate Anthers opening by two pores inwards. Stipules none
524 *Thomasia* Cal persistent, veiny Pet. 5, very small or O. Filam united at base. Anthers opening laterally. Stipules leafy
525. *Syringia* Cal. withering Pet O Filam. 10, every other one barren. Anthers opening at their back. Stipules small, deciduous
526 *Buttneria.* Pet. 5 Nect. 5-leaved Filaments inserted into the end of the nectary. Caps. of 5 divisions, muricated.
527. *Ayenia* Cal. 5-parted Pet 5, connected at end into a star, with their claws slender, bent into the form of a crown Glands 5, stamen-shaped. Nectary cup-shaped. Caps depressed, 5-furrowed, 5-celled, 5-valved. Valves bifid.
528. *Calodendrum.* Cal. 5-parted, short. Petals lanceolate, stalked. Stam. 5, sterile, petal-shaped. Caps. 5-angular, 5-celled, 5-valved, with 2-seeded cells.
529. *Toddalia* Cal 5-cleft Petals 5 Stigma capitate Caps berried, 5-celled. Cells 2-seeded
530. *Bursaria.* Cal. inferior, 5-toothed. Pet. 5, linear Stigma simple Caps. cordate, compressed, 2-partible, 2-seeded. Seeds reniform
531. *Cedrela.* Cal. withering Cor of 5 petals, funnel-shaped, at base united ½ with the receptacle. Caps. woody, 5-celled, 5-valved. Seeds with a membranous wing
532 *Hovenia.* Cal 5-parted. Pet. 5, convolute. Stigma 3-fid Caps. 3-celled, 3-valved. Cells 1-seeded.
533. *Brunia.* Flowers aggregate. Cal. superior, 5-parted. Filaments inserted into the claws of the petals. Stigma 2-fid. Caps. small, 2-celled.
534. *Brossæa.* Cal. fleshy, superior Cor. conical, truncated. Caps. 5-furrowed, 5-celled, covered by the persistent calyx, with 5-fissures.
535. *Itea.* Cal. 5-cleft, campanulate. Pet. 5, linear, reflexed, inserted into calyx. Stigma capitate, 2-lobed. Caps. 2-celled, 2-valved, with the valves bent inwards.
536. *Cyrilla.* Cal. very small, turbinate, 5-parted, superior. Pet. 5, stellate, stiffish. Styles 2-fid. Berry dry, 2-celled. Seeds solitary, attached by a little cord.
537. *Claytonia.* Cal 2-valved Pet. 5 Stigma 3-fid. Caps. 3-valved, 1-celled, 3-seeded.
538 *Impatiens.* Cal. 2-leaved. Pet. 5, irregular, with one cucullate. Anthers at first subconnate. Caps. superior, 5-valved.
539. *Sauvagesia.* Pet. 5, fringed. Sepals 5. Nectary 5-leaved, alternate with the petals. Caps. 3-celled, 3-furrowed, 3-valved, with the edges bent inwards.
540. *Viola* Sepals 5 Petals 5, irregular, connate behind. Anthers adhering at the end by a membrane, or distinct. Caps 3-valved, 1-seeded.
541. *Ionidium.* Sepals 5, produced at their base. Cor. 2-lipped, without a spur. Anthers usually distinct. Stigma simple. Caps 1-celled, 3-valved.

10. *Flowers polypetalous, superior.*

542. *Phyllica.* Cal. 5-parted, turbinate. Pet. O. Scales 5, protecting the stamens. Caps. 3-coccous, inferior.

543. *Plectronia.* Cal turbinate, 5-toothed, persistent, closed by 5 villous scales. Pet. 5, inserted in the throat of calyx. Berry 2-celled, 2-seeded.

544. *Conocarpus.* Pet. 5 or O Seeds naked, solitary. Flowers in heads.

545. *Cyphia.* Cal. 5-cleft, turbinate. Petals linear, dilated at base, connivent, spreading at end. Filaments hairy, cohering. Anthers distinct. Stigma cernuous, hollow, gibbous.

546. *Lightfootia.* Sepals 5. Petals thin, bottom closed by stamen-bearing valves. Stigma 3-5-cleft. Caps. 3-5-celled, 3-5-valved, ½-superior

547 *Jasione.* Flowers in heads Common involucrum 10-leaved. Petals 5, erect. Anthers oblong, coherent at base. Stigma bifid.

548 *Lagoecia.* Umbel simple Common involucre about 8-leaved, partial 4-leaved, finely pinnated. Cal 5-cleft, with many-cut fine segments. Petals 2-fid. Seeds crowned by the calyx

549 *Hedera.* Petals 5, oblong Berry 5-seeded, surrounded by the calyx

550. *Ribes.* Petals 5, and stamens inserted into the calyx. Style 2-fid. Berry many-seeded, inferior.

551. *Gronovia.* Petals 5, and stamens inserted into the campanulate calyx. Berry dry, 1-seeded, inferior.

11. *Flowers incomplete, inferior*

552. *Achyranthes.* Sepals 5 Scales 5, connate at the base into a tube, at the end fringed and alternate with the stamens Stigma 2-fid. Seed solitary, crowned by the conniving sepals

553. *Philoxerus* Sepals 5, irregular Stamens 5, united at the base into a little cup shorter than the ovary. Anthers 1-celled. Style 1 Utricle 1-seeded, without valves

554. *Desmochaeta* Sepals 5 Stamens 5, united at base with a very small cup with neither teeth nor chaff between Stigma capitate. Utricle 1-seeded.

555. *Illecebrum* Sepals 5, vaulted at the end Pet O Stigma simple or bifid Caps. 5-valved, 1-seeded.

556. *Alternanthera.* Sepals 5 Stamens 5, united into a little cup, with or without intermediate teeth, one or more of the stamens usually abortive Anthers 1-celled Stigma capitate

557. *Paronychia.* Cal nearly 5-parted, colored inside Scales or petals 5, linear Style 2-fid. Stigmas 2. Caps. 1-celled, 5-valved.

558. *Chenolea* Cal. globose, fleshy, concave. Cor O Filam inserted into the base of calyx Stigmas 2, spreading Caps. round, depressed, 1-celled, 1-seeded

559. *Anychia.* Cal. connivent, with oblong segments, bagged at the end Pet. O Filam. distinct, with no setæ between Stigmas 2, oblong Caps an utricle, not opening Seed 1, reniform

560 *Ærua* Sepals 5, with 2-3-bracteæ, oblong, on the outside white, hairy, inside smooth. Stamens 10, alternately barren, inserted into a little cup at the base. Style larger, filiform. Stigma bifid

561 *Lestibudesia* Sepals 5 Stamens 5, united into a little cup without teeth Anthers 2-celled. Ovary many-seeded Style short or none Stigmas 3-4, filiform, recurved Caps opening transversely

562 *Rhagodia* Flowers polygamous Perianth 5-parted Stamens 5 or fewer Style bifid. Grain depressed, fleshy, surrounded by the perianth

563 *Deerengia* Perianth 5-parted. Stamens united at base into a small cup Anthers 2-celled. Style 3-parted Berry many-seeded

564 *Tranthema* Sepals oblong, colored inside Stamens 5-10-12, with capillary filaments Ovary half-superior Style 1 or 2, filiform Stigmas simple Caps oblong, truncate, cut round

565 *Celosia* Sepals 5, like a 5-petalous corolla Stam. united at base by a plaited nectary. Caps horizontally opening Style 2-3-cleft

566 *Gomphrena* Sepals 5, colored: outer 3 conniving, keeled. Pet 5, rude, villous. Nect. cylindrical, 5-toothed. Caps. cut round, 1-seeded Style half-bifid

567 *Mollia.* Sepals 5 Pet. 5, emarginate Style simple Caps 3-cornered, 1-celled, 3-valved, many-seeded

568 *Glaux* Cal 1-leaved, colored, 5-lobed. Cor O Caps 1-celled, 5 valved, 5-seeded, surrounded by a calyx.

12 *Flowers incomplete, superior*

569 *Thesium* Cal. 1-leaved, into which the stamens are inserted. Nect inferior, 1-seeded, surrounded by the persistent calyx.

570 *Helsonia* Spathes universal and partial Cal. O Cor 3 petals, superior Nect. 2-leaved. Stigma 1. Caps 3-celled, with 1-seeded cells

571 *Strelitzia.* Spathes universal and partial. Cal. O Cor superior, 3 petals, the larger segments hastate. Nect. 3-leaved, surrounding the stamens Stigmas 3 Caps. 3-celled. Cells many-seeded.

Order 2. DIGYNIA  5 Stamens 2 Styles.

1. *Flowers monopetalous, inferior. Fruit a follicle or capsule.* (Asclepiadeæ.)

572. *Apocynum* Cor campanulate. Filaments 5, alternate with the stamens. Style none Stigma broad Follicles long, linear

573 *Melodinus* Cal campanulate, 5-toothed. Cor. hypocrateriform Limb spreading, with falcate, crenulate segments Corona 5-cleft, with short, stellate, torn divisions. Stigmas 2 Fruit a fleshy globose, 2-celled, many-seeded berry

574 *Periploca* Anthers bearded at back Pollen-masses solitary, made up of 4 confluent ones. Stigma blunt. Follicles cylindrical, divaricating, smooth Seed comose

575 *Cryptostegia* Cor funnel-shaped. Tube with two included bifid scales, alternate with the divisions of the limb. Stamens included, inserted in the base of the tube Filaments distinct. Anthers cohering with the stigma by their base Glands 5, spatulate Pollen granular, simple.

576. *Hemidesmus* Cor with 5 blunt scales under the sinuses. Anthers free from the stigma, simple at end Stigma blunt Follicles cylindrical, much spreading, smooth. Seeds comose.

577. *Secamone.* Corona 5-leaved. Pollen-masses 20, smooth, erect, fixed by fours to the point of each corpuscle of the stigma. Stigma contracted at end

578. *Microloma.* Tube of cor inflated, angular, shorter than the limb Scales inserted into the middle of the tube below the sinuses Anthers terminated by a membrane, sagittate. Pollen-masses compressed, pendulous. Stigma with a little point.

579. *Sarcostemma* Cor rotate Pollen-masses pendulous. Stigma blunt. Seeds comose.

580. *Dæmia* Cor rotate, with a short tube Outer corona 10-parted, short. Pollen-masses pendulous, compressed. Stigma blunt. Seeds comose

581 *Cynanchum.* Cor. rotate, 5-parted. Pollen-masses inflated. Stigma with a little point. Follicles smooth.

582. *Oxystelma* Cor spreading, rotate, with a short tube. Columna exserted. Crown 5-leaved, with compressed, acute, undivided leaflets. Pollen-masses compressed, pendulous, fixed by a narrow end. Stigma blunt. Follicles smooth. Seeds comose

583. *Gymnema.* Cor. 5-cleft. Scales or little teeth of the orifice 5, inserted in the sinuses. Crown none. Masses of pollen erect, fixed by the base Follicle slender, smooth.

584. *Calotropis* Cor. with an angular tube: the angles saccate inside. Crown with carinate leaflets, united lengthwise to the tube of the filaments. Pollen-masses pendulous, fixed by the narrow end. Stigma blunt.
585. *Dischidia* Cor. urceolate, 5-cleft. Corona with subulate, spreading, recurved segments. Pollen-masses erect, fixed by the base. Stigma blunt. Follicles smooth. Seeds comose.
586 *Xysmalobium* Cor. 5-cleft, spreading Corona 10-parted in a single row: the 5 divisions next to the anthers fleshy, round, simple within, the 5 others small. Pollen-masses pendulous, with lax connecting processes Stigma blunt.
587 *Gomphocarpus* Corona 5-leaved, the segments simple within. Pollen-masses compressed, pendulous, fixed by a fine end. Stigma depressed, blunt. Follicles ventricose, covered with innocuous spines. Seeds comose.
588. *Asclepias* Corona 5-leaved, with a process on the inside Pollen-masses fixed by a fine end. Stigma depressed, blunt.
589. *Gonolobus* Cor rotate, 5-parted. Corona shield-shaped Anthers opening across, terminated by a membrane. Stigma flat, depressed.
590 *Pergularia* Cor hypocrateriform, with an urceolate tube. Pollen-masses erect, fixed by their base. Stigma blunt Follicles ventricose, smooth Seeds comose
591. *Marsdenia* Cor urceolate, 5-cleft, sometimes rotate. Pollen-masses erect, fixed by the base. Follicles smooth Seeds comose
592 *Hoya* Cor 5-cleft. Pollen-masses fixed by the base, conniving, compressed. Stigma depressed, with an obtuse wart Follicles smooth Seeds comose
593. *Ceropegia.* Outer corona short, 5-lobed, inner 5-leaved, with ligular undivided leaflets Pollen-masses fixed by their base with simple edges. Stigma blunt. Follicles cylindrical, smooth Seeds comose
594 *Stapelia* Cor rotate, 5-cleft, fleshy Column of fructification exserted. Pollen-masses fixed by the base Stigma blunt. Follicles cylindrical, smooth Seeds comose
595 *Puranthus* Cor fleshy Outer corona none Pollen-masses fixed by the base, with one edge cartilaginous, pellucid. Stigma blunt.
596. *Huernia* Accessory segments of cor tooth-like Leaflets of the inner corona from a gibbous base subulate, undivided, alternate with the outer segments Pollen-masses fixed by the base, with one edge cartilaginous, pellucid. Stigma blunt. Follicles cylindrical, smooth Seeds comose.
597 *Brachystelma.* Cor campanulate, with angular recesses Column included. Crown 1-leaved, 5-cleft, with the lobes opposite the anthers, simple at back Anthers without a membrane at the end. Pollen-masses erect, inserted by the base
598 *Caralluma* Cor rotate, deeply 5-cleft. Cal of fructification exserted. Pollen-masses erect, fixed by the base with simple edges Stigma blunt Follicles slender, smooth Seeds comose

2 *Flowers monopetalous, inferior Fruit a capsule*

599 *Swertia* Caps of 1 cell Cor wheel-shaped, with 2 nectariferous pores at the base of each segment.
600 *Gentiana* Caps of 1 cell. Cor tubular at the base, destitute of nectariferous pores
601 *Hydrolea* Caps 2-valved, 2-celled Cor rotate, campanulate Stamens inserted in the tube
602 *Falkia* Cal inflated, 5-parted, 5-angular Cor campanulate, emarginate, crenate Styles spreading. Stigma globose, woolly Seeds 4, globose, with an arillus in the bottom of the calyx
603 *Dichondra* Cal. 5-parted, with spatulate segments Cor short, campanulate, 5-parted. Stigma peltate, capitate Caps compressed, 2-celled, 2-seeded Seeds round.

3. *Flowers pentapetalous, inferior*

604. *Velezia.* Cal slender, 5-toothed. Cor of 5 small petals Caps 1-celled, at the end 4-valved. Seeds many, attached to a filiform central receptacle
605 *Bumalda* Cal 5-parted Petals 5 Styles villous Caps. 2-celled, with 2 bractes
606 *Heuchera* Petals 5 Caps 2-celled, with 2 bractes
607 *Cussonia* Invol. O Cal. 1-leaved, truncated, crenated. Pet 5, oblong, acute Fruit twin, 2-celled, crowned by the calyx and styles.
608 *Anabasis.* Cal. 3-leaved Pet 5 Berry 1-seeded, surrounded by the calyx.
609 *Salsola* Caps closed, imbricated in the fleshy calyx Seed with a spiral embryo
610 *Kochia* Cal 1-leaved, campanulate, in the fruit expanding into a leafy rim resembling 5 petals Cor. O. Stigmas 2-3, long Caps 1-celled, 1-2-seeded Seed incurved.
611 *Chenopodium* Seed lenticular, truncated, superior.
612 *Beta* Seed kidney-shaped, imbedded in the fleshy calyx.
613. *Bosea* Cal 5-leaved. Cor O Berry 1-seeded
614 *Herniaria* Caps closed, membranous, invested with the calyx Stam. with 5 imperfect filaments.
615 *Ulmus* Caps. closed, membranous, compressed, bordered, superior
616 *Planera* Cal. membranous, subcampanulate, 4-5-cleft. Cor O Stigmas 2, oblong, glandular, spreading Caps. globose, membranous, 1-celled, not opening, either smooth or scaly, not winged, 1-seeded. Stamens 4-6. Polygamous

4. *Flowers pentapetalous, superior.*

617. *Phyllis.* Cal. 2-leaved. Pet. 5 Stigmas hispid. Seeds 2, oblong, fixed to a filiform axis

5 *Flowers pentapetalous, superior Seeds* 2. (UMBELLIFERÆ.)

A. *Fruit of a single or double globe*

618 *Coriandrum* Fruit a single or double globe, smooth, without ribs Cal. broad, unequal. Petals radiant. Floral recept. none

B *Fruit beaked*

619. *Scandix* Beak much longer than the seeds, fruit somewhat bristly. Cal. none. Pet unequal, undivided. Floral recept. 5-lobed, colored
620 *Anthriscus* Beak shorter than the seeds, even. Fr rough, with scattered prominent bristles. Cal none Petals equal, inversely heart-shaped. Fl. recept. slightly bordered
621 *Chærophyllum* Beak shorter than the seeds, angular Fr smooth, without ribs. Cal. none. Pet. inversely heart-shaped, rather unequal. Fl. recept. wavy

C. *Fruit solid, prickly, without a beak.*

622. *Eryngium* Fr. ovate, clothed with straight bristles Cal. pointed. Pet. oblong, equal, inflexed, undivided. Fl. aggregate Common recept. scaly.
623 *Sanicula* Fr ovate, clothed with hooked bristles. Cal. acute. Pet. lanceolate inflexed, nearly equal. Fl separated, dissimilar
624. *Echinophora* Fr ovate, imbedded in the enlarged armed receptacle. Seed solitary Cal. spinous. Pet. inversely heart-shaped, unequal Fl. separated.
625 *Daucus* Fr. elliptic oblong, compressed transversely Seeds with four rows of flat prickles, and rough intermediate ribs Cal obsolete. Pet. inversely heart-shaped, unequal. Fl. separated.
626 *Caucalis* Fr elliptic oblong, compressed transversely. Seed with 4 rows of ascending, awl-shaped, hooked prickles, the interstices prickly or rough. Cal. grooved, acute, unequal. Pet. inversely heart-shaped, unequal. Fl. imperfect, separated
627. *Torilis.* Fr. ovate, slightly compressed laterally. Seeds villous, rough, with scattered prominent,

ascending, rigid prickles. Cal. short, broad, acute, nearly equal Pet. inversely heart-shaped, nearly equal. Fl. united.

628. *Odoeria.* Leaflets of the involucres 3-parted Umbels fascicled, as long as the involucres. Petals split to the base. Fr ovate, hispid, with three streaks

629. *Ledeburia.* Involucres 0. Fr ovate, with spreading bristles. Bases of styles 2, conical, connate at base. Styles persistent.

630. *Myrrhis.* Fr deeply furrowed Cal. none. Pet. inversely heart-shaped, rather unequal. Fl. recept. none Flowers imperfectly separated.

631. *Bunium.* Fr slightly ribbed. Cal small, acute, unequal. Pet. inversely heart-shaped, equal. Fl. recept. none. Flowers imperfectly separated

D *Fruit solid, nearly round, unarmed, without wings.*

632. *Œnanthe* Fr ribbed, somewhat spongy. Cal large, lanceolate, acute, spreading, unequal Pet. inversely heart-shaped, very unequal Fl. recept dilated, depressed Fl separated.

633. *Crithmum* Fr ribbed, coriaceous Cal small, broad, acute, incurved. Pet. elliptical, acute, incurved, equal Fl. recept. none Fl. united, all perfect.

634 *Athamanta* Fr ribbed, ovate, hairy Styles short Cal lanceolate, acute, incurved. Pet. inversely heart-shaped, broadly-pointed, equal. Fl recept. none Fl imperfectly separated

635 *Pimpinella* Fr ovate, ribbed, with convex interstices. Styles capillary, as long as fruit. Cal. none Pet. inversely heart-shaped, nearly equal Fl. recept none Fl either united or dicecious.

636. *Phellandrium.* Flowers fertile. Fruit crowned Fruit ovate, smooth, crowned by the calyx and styles. Involucres partial, not universal

637 *Dondia.* Umbels capitate Involucre 6-leaved, longer than umbel. Petals entire Fruit ovate, solid, with 4 ribs, and convex intervals

638 *Trachyspermum* Leaves of involucre pinnatifid Fruit striated, with 5 muricated ribs Rudiments of calyx 5 Fl. receptacle conical Style withering

639 *Ammi.* Involucre pinnate or pinnatifid. Fruit oblong, with 5 obtuse ribs, and convex intervals

640 *Bubon.* Involucres 0 Fruit ovate, solid, hispid, or villous, with 5 ribs, and broadish bands of the intervals and raphe.

641. *Cuminum* Involucres 5-leaved. Fruit ovate, prismatic, smoothish, bladdery, with 7 ribs, and bearded intervals

642. *Seseli.* Common involucre 0, partial 5-leaved, sometimes 1-leaved. Fruit ovate, solid, with 5 acute ribs, and furrowed, striated intervals.

643 *Thapsia* Fruit narrow, but little compressed, scarcely ribbed, with 2 dorsal and marginal wings

644. *Actinotus* Umbel capitate Involucre woolly, very large Cor 0 Cal 5 sepals Male flowers mixed with hermaphrodite Fruit ovate, villous, with 5 stripes, crowned by the calyx

645 *Trinia* Flowers dicecious Involucre few-leaved Pet ovate, lanceolate Seeds roundish, with 5 ribs, with the intervals once-banded

E. *Fruit solid, unarmed, without wings, compressed laterally, the diameter of its juncture being at least twice as narrow as the opposite diameter*

646 *Sium* Fr ovate or orbicular, ribbed, furrowed Cal small, acute, unequal, or obsolete. Pet. inversely heart-shaped or obovate, equal. Styles cylindrical, shorter than the petals Fl receptacle none Fl. uniform, united.

647 *Sison* Fr ovate or nearly orbicular, ribbed Cal obsolete or blunt Pet elliptical or inversely heart shaped, with an involute point, equal Styles very short and thick Fl. recept. none Fl uniform, united

648 *Cicuta* Fr nearly orbicular, heart-shaped at the base, with 6 double ribs Cal broad, acute, rather unequal Pet. ovate or slightly heart-shaped, nearly equal. Style scarcely tumid at the base Fl. recept. depressed, withering Fl. uniform, nearly regular, united.

649 *Conium* Fr ovate, with 10 acute ribs, wavy in an unripe state Cal obsolete Pet inversely heart-shaped, slightly unequal Styles a little tumid at the base Fl. recept dilated, depressed, wavy, permanent Fl slightly irregular, united

650 *Smyrnium* Fr broader than long, concave at each side, with 6 acute dorsal ribs, interstices convex Cal very small, acute Pet. equal, lanceolate, incurved or inversely heart-shaped. Styles tumid and depressed at the base Fl recept. none Fl nearly regular, partly barren or abortive

651 *Apium* Fr roundish, ovate, with 6 acute dorsal ribs, interstices flat Pet. roundish, with an inflexed point, very nearly equal Styles greatly swelled at the base Fl recept. thin, orbicular, wavy Fl nearly regular, united

652. *Ægopodium* Fr elliptic-oblong, with equidistant ribs, interstices flattish Cal none Pet. inversely heart-shaped, broad, a little unequal. Style ovate at the base Fl. recept none Fl united, all perfect, slightly radiate

653 *Meum* Fr elliptic, oblong, with equidistant ribs, interstices flattish Cal none Pet obovate, with an inflexed point, equal. Styles tumid at the base, short, recurved Fl. recept none. Fl united, all perfect, regular

654 *Anethum.* Invol none Pet. involute, yellow Seeds compressed, with 3 ribs, intervals once-banded.

655 *Carum* Fr elliptic, oblong, with equidistant ribs, interstices convex Cal minute, acute, often obsolete Pet inversely heart-shaped, unequal Styles tumid at the base, subsequently elongated, widely spreading Fl recept angular, thin, wavy, permanent Fl separated, irregular

656 *Cnidium* Fr ovate, acute, with equidistant sharp ribs, interstices deep, concave; juncture contracted Cal none Pet equal, obovate or inversely heart-shaped. Styles hemispherical at the base; subsequently elongated, spreading, cylindrical Fl. recept. annular, thin, undulated, erect, afterwards depressed Flower imperfectly separated, nearly regular

657 *Bupleurum* Fr ovate-oblong, obtuse, with prominent, acute, abrupt ribs, interstices flat; juncture contracted Cal. none Pet equal, broadish, wedge-shaped, very short, involute Styles very short, not extending beyond the circumference of their broad tumid bases Fl recept none Fl all perfect and regular

658 *Hydrocotyle.* Fl nearly orbicular, rather broader than long, angular, much compressed, juncture very narrow. Cal none Pet equal, ovate, spreading, undivided Styles cylindrical, shorter than the stamens, tumid at the base Fl recept none Fl all perfect and regular.

659 *Spananthe* Umbel simple, with few rays Involucre few-leaved. Fruit ovate, solid, smooth, with the juncture and sides contracted, and 5 ribs at the back

660 *Ulospermum* Involucre few-leaved Germen oblong. Ribs of fruit membranous, wavy, curled. Calyx scarcely any. Fl. receptacle flattened. Styles withering

F. *Fruit solid, unarmed, compressed transversely, the diameter of the juncture being much greater than the opposite diameter.*

661 *Æthusa* Seeds ovate, convex, with 5 tumid, rounded, acutely keeled ribs; interstices deep, acute, angular; border none Cal pointed, very minute Pet inversely heart-shaped, rather angular. Fl. recept. none Fl all perfect, slightly radiant.

662 *Imperatoria.* Seeds obicular, with a notch at each end, a little convex, with 3 prominent dorsal ribs, and a dilated, flat, even border Cal. none Pet. inversely heart-shaped, very slightly irregular. Fl. recept none. Fl all perfect, scarcely radiant

663. *Selinum* Scales elliptical, slightly convex, with 3 acute dorsal ribs, and a dilated, flat, even border. Cal. minute, pointed, spreading Pet. inversely heart-shaped, involute, equal. Fl. recept obsolete Fl. perfect, regular, a few occasionally abortive.

664. *Angelica.* Seeds elliptic-oblong, convex, with 3 dorsal wings, and a narrow, flat, even border Cal. none. Pet. lanceolate, flattish, undivided, contracted at each end, equal. Fl. recept. thin, wavy, narrow, permanent. Fl. all perfect,

665. *Ligusticum.* Seeds oblong convex, with 3 dorsal and 2 marginal equa. wings. Cal. small, pointed, erect, broad at the base. Pet. elliptical, flattish, undivided, contracted at each end, equal. Fl. recept. none Fl. all perfect, regular.

666. *Hasselquistia.* Involucres various. Flowers radiant Fruit compressed at edge, flat, roundish. Bark turgid in the circumference with 5 obtuse ribs. Fruit in the middle of the umbel deformed, navicular, torn at edge, with 3 stripes at back.

667 *Artedia* Fruit oblong, compressed, with the marginal wings sinuated, 5 dorsal ribs, and scaly juncture Flowers radiant. Involucres pinnatifid.

668 *Ferula.* Fruit compressed, flat, thickened at edge, with 3 obtuse dorsal ribs, and banded intervals and juncture. Flowers polygamous Involucres various.

669. *Laserpitium.* Fruit oval, somewhat compressed, with the 3 principal ribs acute, the secondary winged. Involucres many-leaved.

G. *Fruit thin and almost flat, compressed transversely, without dorsal wings*

670. *Peucedanum.* Seeds broadly elliptical, with a notch at each end, a little convex, with 3 slightly prominent ribs, interstices striated, border narrow, flat, even, smooth, and entire Cal. pointed, ascending Pet. inversely heart-shaped, all very nearly equal Fl recept none Flowers regular, imperfectly separated.

671 *Pastinaca* Seeds elliptic-obovate, with a slight notch at the summit, very nearly flat, with 3 dorsal ribs and 2 marginal ones, border narrow, flat, thin, even, smooth, and entire Cal. very minute, obsolete Pet. broadly lanceolate, involute, equal. Fl. recept. broad, orbicular, wavy, rather thin, concealing the calyx Fl regular, uniform, perfect.

672 *Heracleum.* Seeds inversely heart-shaped, with a notch at the summit, very nearly flat, with 3 slender dorsal ribs, 2 distant marginal ones, and 4 intermediate, colored, depressed, abrupt lines from the top, border narrow, slightly tumid, smooth, even, and entire. Cal. of 5 small, acute, evanescent teeth. Pet. inversely heart-shaped, radiant Fl. recept. wavy, crenate, obtuse Fl separated

673 *Tordylium* Seeds orbicular, nearly flat, roughish, without ribs, border tumid, wrinkled or crenate, naked or bristly Cal. of 5 awl-shaped unequal teeth. Pet inversely heart-shaped, radiant, variously unequal and irregular Fl recept. none. Fl. separated

674 *Astrantia* Umbels fascicled. Involucres as long as umbels. Fruit oblong, surrounded by furrowed, wrinkled, little bladders

675 *Zosima* Both involucres many-leaved. Petals obcordate, with the little segment involute, acute Fruit compressed, villous, thickened at edge, at the back with 4 bands, which are joined and conniving.

H *Fruit with a coarse, corky, or spongy bark*

676. *Rumia* Partial involucre, 3-8-leaved. Cal. 5-toothed Petals ovate, incurved, with a short crenulate segment. Seeds ovate, fleshy, rugose, scaly

677 *Cachrys.* No involucre Cal. O. Petals ovate, lanceolate, acute Seed obovate, oblong, rounded, smooth, fungous.

678 *Hippomarathrum* Fruit with scaly, rough ribs, covered with a thick bark.

Order 3. TRIGYNIA.  5 Stamens 3 Styles.

1. *Flowers superior.*

679. *Viburnum* Cor 5-cleft. Berry with 1 seed
680. *Sambucus* Cor. 5-cleft. Berry with 3 seeds

2 *Flowers inferior.*

681 *Rhus* Cal 5-parted Petals 5. Berry 1-seeded
682 *Cassine.* Cal. 5-parted. Petals 6. Berry 3-seeded.
683. *Spathelia.* Cal. 5-leaved Petals 5 Caps 3-angular, 3-celled. Seeds solitary.
684. *Staphylea.* Petals 5 Caps 2 or 3, inflated
685. *Tamarix* Pet. 5 Caps of 3 valves Seeds numerous, feathered
686. *Turnera.* Cal 5-cleft, infundibuliform, the outer 2-leaved. Petals 5, inserted in the calyx Stigmas many-cleft. Caps 1-celled, 3-valved
687. *Drypis* Cal. 5-toothed. Petals 5 Caps cut round, 1-seeded.
688. *Alsine* Cal. 5-leaved. Pet. 5 equal. Caps superior, 1-celled, 3-valved, many-seeded Receptacle central, free.
689. *Telephium.* Cal 5-leaved. Petals 5, inserted in the receptacle Caps 1-celled, 3-valved.
690 *Corrigiola.* Pet 5 Seed 1, naked, triangular
691 *Pharnaceum.* Cal. 5-leaved. Cor O. Caps 3-celled, many-seeded.
692 *Portulacaria* Cal. 2-leaved. Petals 5 Seed 1, winged, 3-cornered.
693. *Basella.* Cal. O. Cor 7-cleft; at length berried, with the two opposite segments larger than the rest.

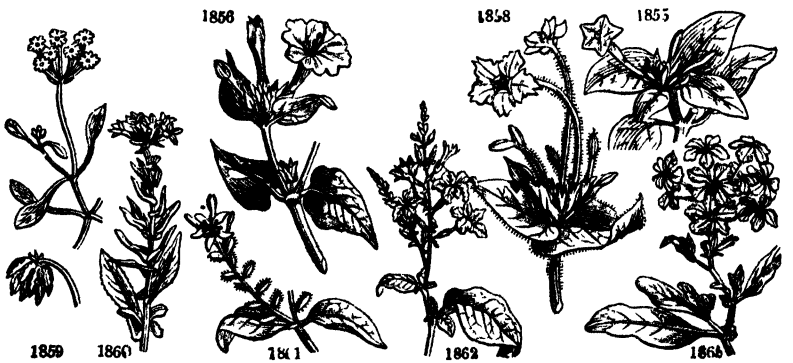
Order 4. TETRAGYNIA.  5 Stamens. 4 Styles.

694. *Parnassia* Nectaries fringed with bristles bearing globes Caps of 4 valves.
695. *Evolvulus.* Cal. 5-leaved Cor rotate, campanulate, with emarginate lobes. Styles 2, deeply bifid. Stigma simple Caps 2-celled, 4-valved, 4-seeded Seeds 2.

Order 5 PENTAGYNIA  5 Stamens. 5 Styles

1 *Flowers superior.*

696 *Aralia.* Involucre very small Umbels globose. Cal very small, 5-toothed. Petals 5, ovate, oblong, spreading, or reflexed. Stigmas nearly round, 5-10 Berry roundish, crowned, 5-seeded. Seeds hard, oblong
697 *Actinophyllum.* Cal. an entire rim. Cor calyptrate, jumping off Stam. 5-6-8-9. Styles 4-7 Berry with 7 angles and 7 cells. Seeds solitary, bony. Flowers clustered.



2. *Flowers inferior.*

698. *Rochea.* Cal. 5-parted Cor. funnel-shaped, 5-cleft. Scales 5, at base of ovary Caps. 5.
699. *Crassula.* Cal 5-leaved. Pet. 5 Scales 5, nectariferous at base of ovary Caps. 5.
700. *Giesekia* Cal. 5-leaved. Cor O Caps 5, close together, roundish, 1-seeded.
701. *Linum.* Pet. 5 Capsule of 10 cells.
702 *Drosera.* Pet. 5 Caps of 3 valves, with many seeds.

703. *Commersonia.* Cal. 1-leaved, bearing the cor Petals 5. Nectary 5-parted. Caps 5-celled, echinate.
704. *Rulingia.* Petals 5, with a cucullate base. Sterile stamens 5, undivided. Ovary 5-celled. Caps. with double septa.
705. *Armeria.* Cal. 2-leaved, entire, plaited, scarious. Petals 5. Seed 1, superior. Flowers in heads, with a common many-leaved involucrum.
706. *Statice.* Cal. 2-leaved, entire, plaited, scarious. Petals 5. Seeds 1, superior. Flowers scattered in a panicled or spiked scape.

History, Use, Propagation, Culture.

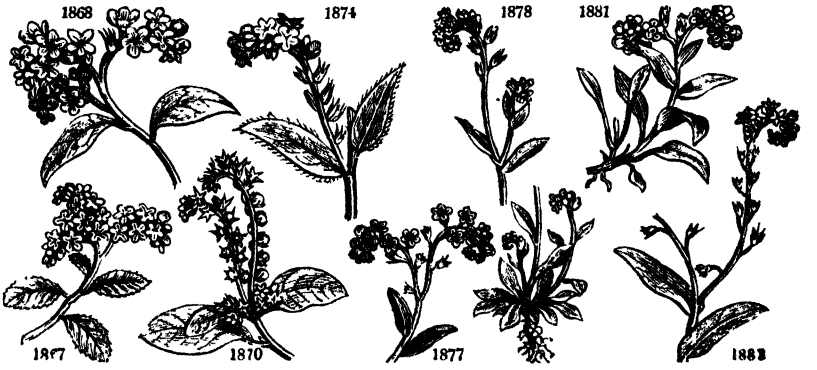
322. *Mirabilis,* is a Latin word, signifying something wonderful or admirable, and applied with some reason to this, the most fragrant of flowers Clusius called it Admirabilis We from the same cause call it Marvel of Peru. The French botanists still call the genus by Van Royen's name, Nyctago; derived from νυξ, night, and ἀγω, to act, on account of the flowers expanding at night. M dichotoma is called the four-o'clock flower in the West Indies, from the flowers opening regularly at that time of the afternoon M jalapa is a very ornamental plant in warm borders. When cultivated, it sports into many agreeable varieties. It flowers best when treated as a tender annual, and then planted out, but if sown at once in the open air, it will flower late in the season in favorable summers Its large tuberous roots, if taken up and preserved during winter like those of Dahlia, or even covered well with litter in the open garden, will flower perennially. The powder of these roots washed, scraped, and dried, is one of the substances which form the jalap of druggists.
323. *Abronia.* Derived from ἁβρος, delicate. The little plant produces flowers surrounded by an involucrum of a charming rose color.
324. *Plumbago.* Pliny says this plant was so called from *plumbum,* because it possessed the power of curing a disorder in the eyes called by that name, which appears to have been the same as what we call cataract. There

Order 6. POLYGYNIA.  5 Stamens. Many styles.

707. *Myosurus.* Pet. 5, with tubular honey-bearing claws. Seeds naked. Cal. spurred at the base.
708. *Ceratocephalus* Cal 5-leaved, persistent. Petals 5, with a honey pore at base covered by a scale. Seeds several, naked, attached to a bearded receptacle
709. *Xanthorhiza* Cal. 0 Petals 5. Nectaries 5, stalked Caps. 5, 1-seeded
710. *Sibbaldia.* Cal. 10-cleft. Petals 5, inserted in the calyx. Styles from the side of the ovary Seeds 5

MONOGYNIA.

1855 Flowers sessile erect axillary solitary
1856 Flowers clustered stalked, Leaves smooth



1857 Flowers clustered somewhat stalked, Tube of cor. 4 times as long as limb, Leaves cordate smooth
1858 Flowers clustered sessile, Leaves pubescent

1859 The only species, resembling Primula farinosa. Very beautiful

1860 Leaves stem-clasping lanceolate rough, Stem erect
1861 Leaves stalked ovate smooth, Stem filiform
1862 Leaves stalked ovate smooth somewhat toothed, Stem with swollen joints
1863 Leaves stalked ovate smooth, Stem flexuose climbing
1864 Leaves obovate retuse smooth
1865 Leaves stalked oblong entire glaucous beneath, Stem erect
1866 Leaves stem-clasping lanceolate smooth, Stem divaricating

1867 Leaves lanceolate ovate, Stem shrubby, Spikes numerous aggregate corymbose
1868 Leaves oblong lanceolate, Stem shrubby, Spikes terminal aggregate corymbose, Sepals long subulate
1869 Leaves ovate rugose scabrous opposite and alternate, Spikes in pairs
1870 Leaves ovate entire tomentose rugose, Spikes in pairs
1871 Leaves stalked oblong obtuse entire rough with scattered hairs
1872 Leaves lanceolate glaucous smooth obsoletely veined opposite and alternate, Spikes in pairs
1873 Leaves linear lanceolate glaucous smooth opposite and alternate, Spikes in pairs or compound
1874 Leaves ovate lanceolate villous, Spikes solitary lateral stalked
1875 Leaves cordate ovate subserrate rugose, Spikes terminal simple solitary, Stem herbaceous
1876 Leaves ovate entire tomentose plaited, Spikes solitary and in pairs

1877 Cal 5 toothed smoothish, Teeth nearly equal obtuse as long as the tube of cor Leaves lanceolate obtuse smooth, Limb of cor more than twice as long as cal
1878 Stem hairy, Calyx with dense spreading hairs hooked at the end
1879 Seeds smoothish sawed at edge, Stem simple few-flowered and oblong, Leaves villous
1880 Stem nearly sim. with lanc nearly acute somew. repand lvs. hispid, Sp. in pairs somew corym Cal. very obt.
1881 Seeds naked, Radical leaves stalked, Racemes without bracteæ, Hairs of calyx spreading
1882 Stem diffuse, Branches and flower-stalks much shorter than cal Leaves oblong ovate obtuse upright
1883 Cal spreading 5-parted, Segments unequal acute, Hairs long downy

and Miscellaneous Particulars

is also a modern reason for the application of the name to this genus. P. europæa is called toothwort, and *dentelaire*, Fr., from its curing the tooth-ach, for which purpose the bruised root is chewed, when it excites by its causticity a healthy salivation, but stains the teeth of a lead color. The species are all pretty, easily cultivated, and almost always in flower.

325 *Heliotropium.* From ἥλιος, the sun, and τρεπω, to turn. Both Pliny and Dioscorides assert that the flowers are always turned towards the sun It was called *Verrucaria* by the Latins, because the juice of the leaves mixed with salt was said to be excellent in removing warts, *verrucæ* H peruvianum and europæum are popular plants, with the smell of new hay. the former is rather tender; but both keep flowering during most of the summer months. Curtis recommends keeping H. peruvianum in a stove during winter.

326. *Myosotis* So named from μυς, a rat, and ὠτις, ὠτος, an ear. Its oval velvety leaves are like the ear of a rat or mouse. M scorpioides, Forget-me-not, has its specific name from the racemes of flowers, which, when young, bend in at the top like a scorpion's tail. It is a well known sentimental flower, will grow any where, and varies more than most plants with situation. On dry walls and rubbish, it is dwarfish, rough, and hairy, not rising when in flower more than two or three inches; in muddy ditches it is smooth all over, of a shining light

History, Use, Propagation, Culture,

green, and two or three feet high In common soils, as in a garden or loamy corn-field, it assumes an intermediate character Linnæus considers the plant as deadly to sheep In gardens it does well in pots in the shade, or treated as a bog-plant, than which few better deserve the name of pretty

327. *Echinospermum* Named by Lehmann from ἐχῖνος, a hedgehog, and σπέρμα, seed, the seeds being very prickly, by which character, and their being compressed, not depressed, and the bracteæ of the inflorescence, the genus is principally distinguished from Myosotis and Cynoglossum.

328 *Mattia.* A genus divided by Professor Schultes from Cynoglossum, with which it agrees in general character. Named after some unknown botanist.

329. *Tiaridium.* From τιάρα, an episcopal head-dress, and εἶδος, similar; on account of the resemblance between its seeds and a mitre. Three species have been described, of which one is the H. indicum of Linn., a plant of no beauty or merit.

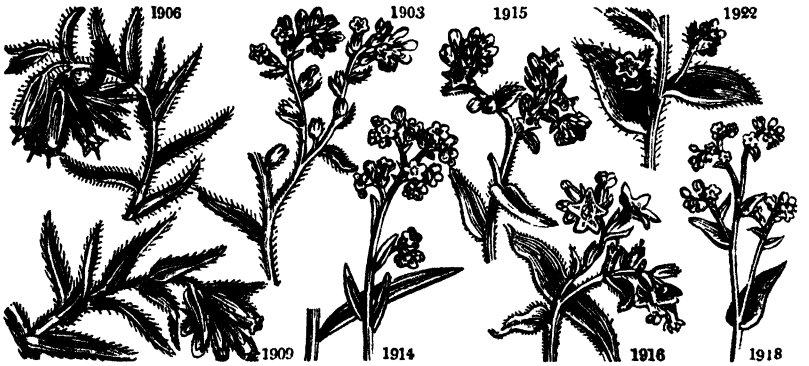
330. *Lithospermum.* From λίθος, a stone, and σπέρμα, seed, the seeds being hard and shining, like little pebbles. L. officinale has stony, brittle, egg-shaped nuts, exquisitely polished, grey or yellowish; and being considered like a stone, were for that reason used as a cure for the disease so named. The bark of L. arvense abounds with a deep red dye, which stains paper, linen, &c and is easily communicated to oily substances, like the alkanet root, and hence is called bastard alkanet. The country girls in the north of Sweden stain their faces with the root on days of festivity.

1884 Stem nearly simple hispid, Leaves lanc acute hairy ciliated at base, Cal very spreading
1885 Stem branched diffuse, Lvs. lanc. acute hispid, Racemes simple elongated, Flow very remote, Cal. acute
1886 Stem branched, Leaves obovate obtuse mucr Fl.-stalks in fruit much spreading thickened under calyx

1887 Seeds all over prickly, Leaves ovate oblong, Racemes divaricating
1888 Seeds with a double row of marg prickles, Lvs. lanc with incumb hairs, Limb of cor. camp longer than cal
1889 Seeds with a single row of marginal prickles, Leaves obl obtuse with spreading hairs, Cal as long as cor
1890 Seeds with a doub. row of very short mar. prickl. Lvs lanc. with incum. hairs, Cor twice as long as cal. with a flat limb

1891 Stam. as long as cor. Segments of cor obtuse, Racemes terminal umbelled, Leaves hoary
1892 Cal. woolly, Limb of cor acute deeply 5-cleft, Racemes cernuous

1893 Stem herbaceous erect hairy, Leaves ovate cordate acute hairy, Tube of cor twice as long as calyx



1894 Seeds smooth, Cor. scarcely longer than calyx, Leaves lanceolate acute veiny
1895 Leaves lanceolate linear strigose, Cal the length of cor. spreading in fruit
1896 Leaves linear lanceolate acute, Spikes terminal 1-sided, Bractes lanceolate, Seeds muricated
1897 Seeds smooth, Cor. much longer than cal. Leaves lanceolate acute at each end, Stem herbaceous
1898 Leaves linear hispid revolute at edge, Stamens as long as corolla
1899 Seeds smooth, Cor. twice as long as cal Lvs. obl lanc. acute, Spikes leafy distichous term. and axillary
1900 Leaves linear lanceolate strigose, Cal as long as tube of cor. in fruit conniving
1901 Seeds smooth, Cal spreading incurved, Leaves linear
1902 Flower branches lateral, Bractes cordate stem-clasping
1903 Stem nearly simple villous, Leaves oblong obtuse hoary, Tube of cor. twice as long as calyx

1904 Hairy, Floral leaves ovate, Cal long lanceolate
1905 Silky, Leaves linear, Cal. long linear, Corolla crenate, Tube long

1906 Hirsute, Hairs prost. scattered, Fl.-stems simp aggregate, Lvs lin acute, Anthers shorter than filaments
1907 Flowers ventricose, Fruit erect, Leaves lanceolate hispid, Hairs stellulate
1908 Flowers cylindrical acute, Fruit pendulous, Leaves linear hairy
1909 Hispid, Hairs erect scattered, Stem branched, Leaves lanceolate, Anthers as long as filaments
1910 Silky, Hairs prostrate very minute, Stems branched, Leaves spatulate, Anthers as long as filaments
1911 Flowers clavate cylindrical, Leaves oblique the lower lanceolate obtuse, Fruit erect, Seeds smooth
1912 Stem simple leafy, Leaves linear lanceolate very long acute 3-nerved above hispid beneath closely hairy

1913 Leaves lanceolate strigose entire, Panic. dichotomous divar. Flower stalked, Cal 5-parted subulate
1914 Leaves lanceolate callous villous, Racemes trichotomous
1915 Leaves lanceolate strigose, Spikes 1-sided imbricated, Cal as long as tube of corolla
1916 Leaves linear-lanceolate coarsely dotted hispid, Calyx in fruit camp. nodding

1917 Racemes nearly naked in pairs
1918 Leaves oblong entire narrowed at both ends with the simple stem hispid, Peduncles trifid
1919 Leaves linear lanceolate villous, Racemes alternate
1920 Strigose, Leaves linear toothed, Stalks less than bracteæ, Cal. in fruit inflated
1921 Leaves oblong, Bractes longer than the 5-parted calyx, Valves of corol. shorter than stamens
1922 Leaves ovate strigose, Racemes somewhat capitate in pairs leafy, 2-leaved at base, Cal. 5-cleft
1923 Leaves obl. toothed hispid the lower stalked the upper sessile, Flowers single lateral, Stems diffuse

and Miscellaneous Particulars

331. *Batschia.* Named in honor of John George Batsch, a German professor of botany in the university of Jena, in the latter part of the last century. His works upon Fungi are still quoted. The three species known are natives of North America, and are very pretty plants

332. *Onosma.* An ancient name, the origin of which, from ὄνος, an ass, and ὀσμη, smell, as being a plant with flowers grateful in their smell to asses, is not very certain What was intended by Pliny and Dioscorides as Onosma has not been satisfactorily ascertained It was undoubtedly a plant of this family This genus in its wild state is found chiefly on rocks; and, like most temporary rock-plants, is not easily preserved otherwise than on dry walls, heaps of rubbish, or artificial rock-work The species are pretty, and all have yellow flowers.

333. *Anchusa.* Derived from ἀγχουσα, paint. In early times, the root of A tinctoria was used for staining the features when more delicate colors were unknown. The English name Bugloss has been formed from βους, an ox, and γλωσσα, a tongue, in allusion to the long rough leaves. A. officinalis is nearly allied in qualities to Borago. The tube of the corolla is melliferous, and very attractive to bees; the leaves are juicy, and the roots mucilaginous, and used in China for promoting the eruption of the small-pox A tinctoria is cultivated in the south of France for the roots, which communicate a fine deep red to oils, wax, and all unctuous substances, as well as to spirits of wine. It is used chiefly by the apothecaries for coloring plaisters, lip-salves, &c. and by vintners for staining the corks of their port wine bottles, or for coloring and flavoring the spurious compounds sold as port wine.

History, Use, Propagation, Culture,

334 *Symphytum* Named from συμφυω, a union or junction, the plant having for a long time passed for a famous vulnerary The French name for the plant, *Consoude*, has the same meaning; but that of the English term Comfrey is obscure S. officinale abounds in mucilage, and may be substituted for Althæa officinalis. All the species are large, coarse, but showy shrubbery plants, flowering for two or three months together, and S asperrimum the whole season

335 *Onosmodium* From *Onosma* and ειδος, similar to Onosma; from which it is not very different either in habit or characters.

336. *Cynoglossum* From κυων κυνος, a dog, and γλωσσα, a tongue Its long soft leaves have been compared to the tongue of a dog C officinale smells like mice, was considered anti-scrophulous, and is disliked by cattle.

337. *Omphalodes* From ομφαλος, a navel, and ειδος, resemblance; the round seeds, which are depressed in the centre, may be compared to a little navel, for the same cause it is called Navelwort in English. O. linifolia is a common border annual. O verna is a beautiful little plant with blue flowers, like the Forget-me-not, peeping from among the snow in every cottager's garden in the early spring.

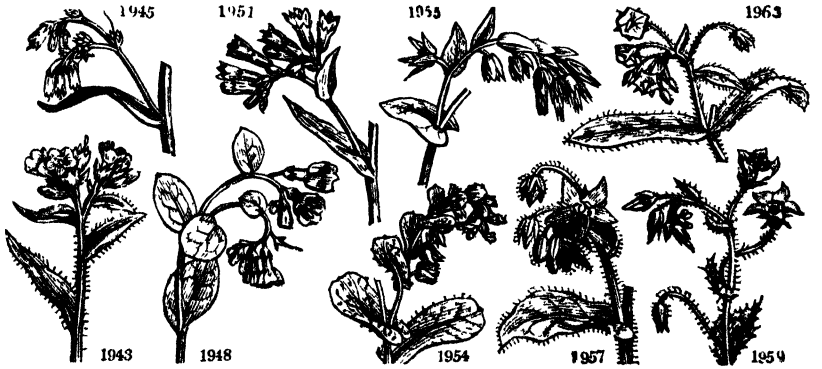
338. *Pulmonaria.* Derives its name, some say, from the speckled appearance of the leaves resembling diseased lungs; but others think that its name has arisen from the plant having been used with success in pulmonary complaints; whence also, perhaps, the English name Lungwort It must not, however, be inferred from

1924 Leaves ovate lanceolate decurrent

1925 Leaves ovate oblong narrowed at base the lower stalked, Segments of flower very short obtuse
1926 Leaves ovate obl narr at base hairy the lower stalked the flor opp sess. Cal. spread Segm. of fl. acute
1927 Leaves cordate ovate hairy stalked the floral opp sess Segments of flower obtuse, Stem branched
1928 Lvs cord ovate or lanc acumin. stalked very rough, Stem muric with reversed bristles, Lamb of fl. camp
1929 Leaves cordate ovate acuminate hairy, floral sessile nearly opposite, Stem simple

1930 Hispid, Leaves oval lanceolate acute papillose, Segments of cor. very acute
1931 Hoary, Leaves oblong about 3-nerved, Segments of cor oval

1932 Leaves broad lanceolate wavy hoary on each side sessile close together, Seeds warted
1933 Leaves spatulate lanceolate shining nearly naked scabrous beneath
1934 Leaves lanceolate tomentose the upper obovate lanceolate cordate stem-clasping, Sepals ovate
1935 Very hairy, Leaves oval the upper stem-clasping, Corymb. terminal leafless on a long stalk
1936 Leaves villous, Cal. hairy, Stamens longer than corolla
1937 Stamens longer than corolla, Cal. villous, Radical leaves ovate stalked very large
1938 Leaves lanceolate villous, Seeds with hooked prickles
1939 Leaves spatulate obtuse, Flowers heaped



1940 Radical leaves ovate cordate, Cauline ovate stalked, Shoots creeping
1941 Leaves linear lanceolate smooth roughish with little teeth at the edge, Seeds urceolate rugose
1942 Leaves obl. lanc. nerved smooth and shining above pubesc. beneath the lower on long stalks the upper sess.

1943 Cal. length of the tube of the cor Leaves oblong lanceolate the radical sessile cauline stalked
1944 Cal. length of the tube of the cor Radical leaves ovate cordate scabrous cauline ovate sessile
1945 Cal. short 5-parted hispid, Radical lvs ovate cordate stalked, cauline half stem-clasping, Flowers panicled
1946 Cal short 5-parted hispid, Leaves ovate oblong acuminate hairy
1947 Smooth erect, Radical leaves on long stalks lanceolate, cauline linear oblong, Flowers panicled, Cal. short
1948 Cal much shorter than tube of cor which is longer than limb, Radical leaves ovate elliptical cauline ob-
1949 Cal. short, Rad leaves cordate [ovate lanceolate obtuse
1950 Smooth, Leaves ovate glaucous fleshy, Stem branching procumbent
1951 Leaves ovate lanceolate acuminate downy decurrent radical stalked, Cal longer than tube
1952 Leaves hispid radical obl lanc. acuminate narr. into the stalk, Cauline decurrent, Cor campanulate

1953 Cor obtuse spreading ventricose campanulate at end, Stamens shorter than corolla, Leaves smooth
1954 Cor obtuse spreading cylindrical, Stamens as long as cor Leaves rough
1955 Leaves stem-clasping entire, Cor acute closed whole colored, Segm of cal unequal
1956 Leaves stem-clasping entire, Cor acute closed with a red band in middle, Seg of cal uneq Stems many

1957 Leaves ovate the lower stalked all alternate, Cal. spreading, Pedunc terminal many-flowered
1958 Leaves cordate stalked, Pedunc many-flowered, Stamens exserted villous
1959 Leaves alternate oblong sessile, Pedunc axillary 1-flowered, Cor campanulate nodding
1960 Glaucous, Stem smooth, Leaves decurrent rough above, Segments of cor lin. lanc spreading unequal

1961 Leaves of stem and branches lanc half stem-clasping, Pedunc 1-flowered, Sepals auriculated at base
1962 Leaves opposite stalked ovate, Pedunc many-flowered, Sepals ovate acute erect
1963 Sepals not auriculated. Nuts smooth without an edge, Leaves sessile attenuated at the base

and Miscellaneous Particulars

English names of this sort having been applied to plants, either that lungwort was ever used in this country for the lungs, or liverwort for the liver The truth is, that the old herbalists, or translators of the classical writers upon natural history, made English names after their Latin denominations, without enquiring whether such continued to be applicable or not, and their less informed successors had no difficulty in finding those virtues in the plants which were indicated by the names of the translators. P. virginica, sibirica, and maritima are elegant plants, greatly resembling each other, and considered by some as most probably only varieties. They are among the most elegant ornaments of the flower-garden in dry springs; but they require some care in keeping, unless in a soil almost entirely of sand.

339. *Cerinthe.* From κηρος, wax, and ανθος, flower, because there is great attraction for bees in the flowers. The French word *melinet* and the English honeywort have been formed in the same sense. C. major is a shewy border annual, much frequented by bees. In Italy and Sicily it is very common, and a biennial.

340. *Borago,* is said by Apuleius to be an alteration of *corago,* and to have been named on account of its cordial qualities. Pliny says that wine, with this infused in it, cheers the spirits. B. officinalis was formerly in great repute as a cordial. According to Withering, the young leaves may be used as a salad or as a pot-herb, and the flowers form an ingredient in cool tankards.

341. *Trichodesma.* From θριξ τριχος, hair, and δεσμος, a bond, the stamens being united by interwoven hairs;

History, Use, Propagation, Culture,

the principal feature in the generic character. This has been separated from Borago by modern botanists, it is a plant of no beauty

342. *Asperugo.* So called from its asperity The only species is a procumbent annual with small blue flowers, found all over Europe, from Lapland to the Mediterranean

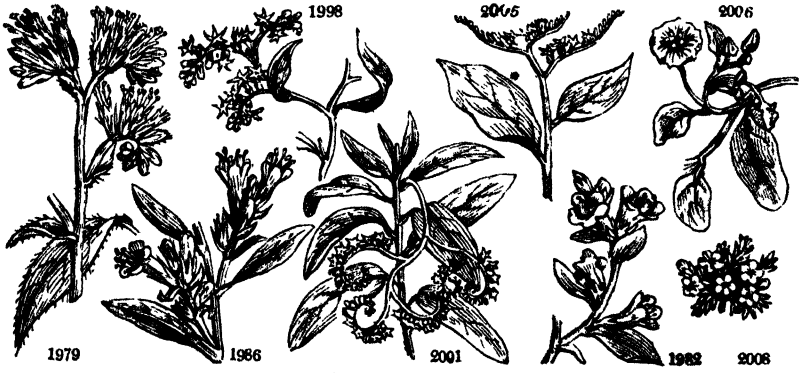
343. *Nonea.* A name contrived by Mönch, in his Methodus Plantarum, to distinguish the dark flowered species of Lycopsis. The genus was long neglected, but has recently been adopted by both Decandolle and Lehmann.

344. *Lycopsis.* From λυκος, a wolf, and οψ, the eye. Ingenious people have found a similarity between the small blue flowers of this plant and the eye of a wolf. All the species are weed-like plants.

345. *Echium,* is an ancient name applied to some plant of this family, and derived from εχις, a viper, from the resemblance between its seeds and the head of a viper The spotted stem, which may be likened to a snake's skin, affords a reason for the application of the name. All the species are beautiful in their flowers, but rough and unpleasant in their foliage. The common E. vulgare of our downs is perhaps the handsomest of European plants.

1964 The only species. Stem climbing very rough, Flowers small axillary

1965 Leaves entire, Stem erect, Cal. of fruit inflated pendulous
1966 Leaves obl lanc. strigose floral cordate longer than the cal. Cal acute, in fruit inflated pendulous
1967 Cal. 5-cleft, in fruit inflated pendulous, Leaves obl. hispid floral cordate longer than cal. Stems procumb
1968 Stem procumbent, Leaves entire, Cal. of fruit pendulous, Cor. shorter than calyx
1969 Leaves lanceolate, Stem prostrate, Cal. of fruit inflated nodding 10-angular, Cor. longer than calyx
1970 Leaves lanceolate denticulated hispid ciliated, Cal. of fruit inflated pendulous



1971 Leaves repand toothed callous, Stem decumbent, Corollas nodding
1972 Leaves lanceolate hispid, Cal. always erect
1973 Leaves ovate entire scabrous, Cal. erect

1974 Pubescent, Fl. in loose corymb. Pan at end of branches, Tube closed by a 5-lobed fringe, Stam. included
1975 Stem shrubby, Leaves lanc. nervose and branches hairy, Sepals oblong and lanceolate acute, Styles hairy
1976 Stem smooth, Leaves lanceolate rough above, Flowers cymose equal, Tube of flower very long
1977 Stem shrubby, Branches and leaves prickly, Flowers in spikes, Corollas nearly equal
1978 Stem shrubby, Leaves lanc atten at base hairy, Hairs very short, Bract. and cal. strigose, Stam. exserted
1979 Stem shrubby upright branched, Leaves oblong lanc hairy, Cor campanulate small, Stamens exserted
1980 Stem and lanceolate acute leaves silky, Spike terminal nearly simple leafy
1981 Stem smooth, Leaves lanceolate smooth ciliated prickly, Cor. equal
1982 Stem smooth, Leaves lanceolate smooth scabrous at edge
1983 Stem branched, Leaves lanceolate nerved and branches silky, Styles hairy, Racemes cylindrical
1984 Leaves lanceolate nerved and branches silky, Styles hairy, Racemes ovate
1985 Stem villous, Leaves sword-shaped elliptical villous, Spike compound linear oblong
1986 Stem shrubby, Branc and cal smooth, Lvs lanc. glauc. veinl. smooth above with a few coarse hairs at back
1987 Leaves radical ovate lined stalked [towards the end
1988 Stem herbaceous hairy, Leaves linear lanc strigose hairy lower nerved, Cor equal, Stamens exserted
1989 Stem erect hispid, Leaves linear lanceolate hispid, Spike compound terminal, Cor nearly equal
1990 Stem warted hispid, Cauline leaves lanceolate hispid, Flowers spiked lateral
1991 Cor as long as stamens, Tube shorter than calyx
1992 Leaves spatulate lanceolate villous, Stam shorter than corolla
1993 Stem herb erect panic hisp dotted, Lvs lin lanc strigose, Flowers remote, Stamens ½ as long again as cor
1994 Stem herb echinate, Lvs obl. lanceol hispid little narrowed at base, Stam as long as cor Cal. of fr distant
1995 Stem branched, Cauline leaves ovate, Flowers solitary lateral
1996 Stem nearly simple, Lvs lanc rather silky, the radical very long on stalks, Spikes axillary bent backwards
1997 Stamens shorter than cor. Cal. as long as limb, Leaves lanceolate strigose

1998 Stem shrubby, Leaves stalked, Flowers hypocrateriform
1999 Stem herbaceous, Leaves sessile, Flowers funnel-form
2000 Leaves ovate-lanceolate hairy, Peduncles branched, Spikes pendulous
2001 Leaves ovate entire naked, Spikes in cymes
2002 Leaves ovate acuminate smooth above rugose, Spike cymose erect recurved
2003 Leaves nearly lanceolate hoary, Stem half shrubby
2004 Leaves ovate acuminate nearly smooth, Leafstalks hairy, Stem climbing, Cal. 5-parted
2005 Stem climbing, Leaves ovate oblong acute repand smooth, Berry with 4 projections bipartible

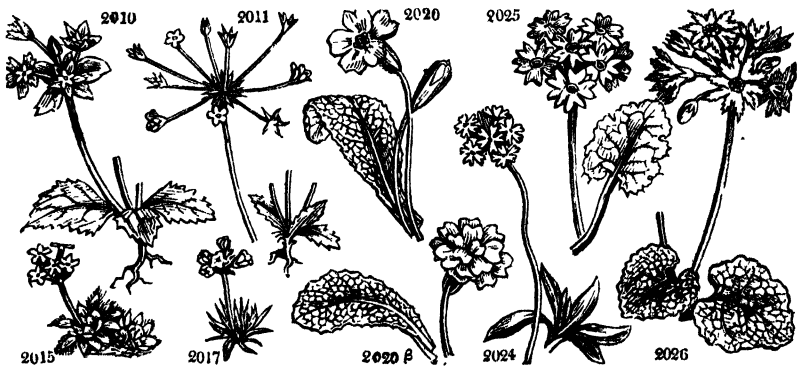
2006 Leaves ovate oblong, Cal pyramidal, Sepals triangular sagittate

2007 Stems rounded, Leaves imbricated, Flowers sessile
2008 Villous, Scapes 1-flowered
2009 Stem branching, Leaves smooth above, Pedunc short, Petals conniving

and Miscellaneous Particulars.

346 *Tournefortia* So named by Linnæus, after Joseph Pitton de Tournefort, author of an elegant arrangement of plants under the title of *Institutiones rei Herbariæ*, and the father of the French school of botany. The system of Jussieu is founded upon that of Tournefort, or is rather an adaptation of the principles of that botanist to the actual state of the science. The species are by no means handsome either in flowers or foliage, and in some cases the latter is even fetid.

347 *Nolana* Is a diminution of *nola*, signifying a bell in low Latin. The name has been applied to this plant on account of its bell-shaped corolla. The species are hardy annuals, of beautiful appearance when in flower. They may be sown in the spring in the open border, where they will grow without protection



348 *Aretia* In honor of Benoit Aretio, a Swiss, professor in the university of Berne. He died in 1574. He published a work upon alpine plants, and his name has been applied to a charming alpine genus, said by some, with little reason, not to be distinct from Primula. The species are very delicate, and require good air and skilful cultivation to succeed well. They are peculiarly suitable for rock-work or growing in pots, well drained, and filled with turfy loam and peat.

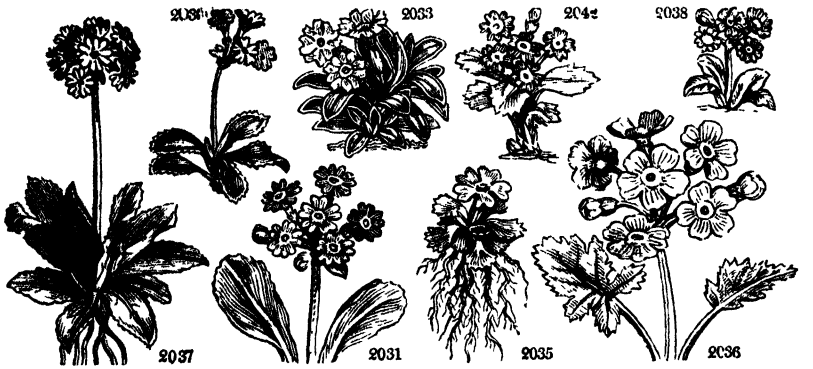
History, Use, Propagation, Culture,

349 *Androsace* From *ανηρ ανδρος*, a man, and *σακος*, a buckler, the large round hollowed leaf of the common Androsace has been compared to the buckler of the ancients The Androsace of Pliny and others must have been something very different. These are elegant mountaineers which may be treated in all respects as Aretia.

350 *Primula*, is derived from *primus*, the first, — to flower, the delicate blossoms of many of the species appearing when all nature is otherwise inert. This genus consists of beautiful dwarf alpine plants, valuable in horticulture, on account of their flowering early in spring, and being prolific in variation

P. vulgaris is a native of most parts of Europe in woods and hedges on a moist clayey soil It is generally found with brimstone-colored flowers, and single, but in some places, though rarely, it is found of a white, and again, of a purple hue, and occasionally double The leaves and roots, which smell of anise, when dried, ground, and used as snuff, act as a sternutatory, and, taken internally, as an emetic The varieties and subvarieties of this plant are very numerous Some consider P veris and elatior as sprung from it, and only more permanent varieties. The Hon W Herbert says, he raised from the seed of one umbel of a highly-manured red cowslip, a primrose, a cowslip, and oxlips, of the usual and other colors; a black polyanthus, a hose-in-hose cowslip, and a natural primrose bearing its flower on a polyanthus stalk; and from the seed of the hose-in-hose cowslip he raised a hose-in-hose primrose (*Hort Trans* iv 19.) But this requires confirmation, as the circumstance was never before recorded. For distinction's sake we shall consider them as species or subspecies



The varieties of P. vulgaris are arranged by florists in two classes, the first contains all those whose flowers are on separate pedicels, rising from the root upon a common stem, so short as not to be seen without separating the leaves of the plant, and are called primroses. The second class includes all those whose flowers are in umbels on a scape or flower-stalk rising from three to six inches or more, and are called polyanthuses Of the primroses there are about a dozen beautiful varieties in cultivation; and of the polyanthus an astonishing number, readily added to by propagation from seed. The names of the varieties, with the exception of the double sorts riven above, are entirely arbitrary. The rules for judging of the beauty or merits of a variety are also wholly artificial, and founded on an imaginary form far removed from ordinary nature These rules or canons are

2010 All villous, Leaves ovate oblong and sepals toothed, Involucres very large, Flowers very small
2011 Much branched rough, Branches spreading, Leaves obl. somew. toothed, Sepals lanc. ent. Fl. very small
2012 Roughish erect, Lvs. lanc. tooth atten at base, Prop. ped. elong. upright, Cor. longer than cal Pet. ov. ent.
2013 Leaves lanceolate entire villous, Umb. few-flowered, Cor longer than the ovate campanulate calyx
2014 Smooth, Lvs. lanc. lin. tooth at end, Ped. sprdg. elon. Cor. longer than cal. pet. obcord. (*A coronopif* B M.)
2015 Pubescent, Leaves lanc. nearly entire ciliated, Umb few-flowered, Cor. longer than the turb. calyx
2016 Caulesc. smooth, Lvs. lin. shining ent. cil. at end, Umb. few-fl. Stalks elong. Cor longer than turb. calyx
2017 Caulesc. pubesc. Lvs. scattered lin. subulate ciliat. Umb. few-fl. Stalks short, Cor longer than turb calyx
2018 Leaves elliptical lanceolate smooth, Scapes umbellate
2019 Lvs. ov. lanc. from middle to end acutely toothed, Scape lvs. and stalks rather long than involucre. Cor shorter than angular cal. (*A. Bocconi* of Gardens.)

2020 Leaves obovate oblong toothed rugose villous beneath, Umb. radical, Flower-stalks as long as lvs. Cor. flat

2021 Leaves toothed rugose hairy on both sides, Umbel many-flowered with outer flowers nodding, Cor flat
2022 Lvs. toothed rugose hairy beneath, Umb many-flowered, Flowers all nodding, Cal. angular, Cor. concave
2023 Lvs. cuneate lanc. rug. cren. tooth. powdery, Umb many-fl Ped spread Tube gland at end, Limb flat the
2024 Leaves sessile lanc spatul. entire smooth on both sides, Outer fl. nodding [length of tube
2025 Lvs. cordate stalked doubly crenate smooth beneath hairy at the veins, Stalks villous, Umb many-fl. erect
2026 Leaves cordate crenate-lobed very rugose, Corolla acutely toothed
2027 Leaves oblong spatulate toothed green on each side, Leaves of involucre auricled at base
2028 Leaves obl. oval serrulate villous pale green, Scape 2-3-fl erect rounded, Cal globose, Tube of cor villous

2029 Leaves lanc flat finely toothed smooth, Umb. many-fl erect, Leaves of invol connate at base
2030 Leaves smooth on each side crenate powdery at edge, Cal very short (*P crenata*, Lehm.)
2031 Leaves obov. ent. or serr. fleshy, Scape central as long as lvs Umb erect, Inv with short lvs Cal. powdery
2032 Leaves spatulate serrated smooth, Scape lateral, Umbel nodding, Involucre with large leaves
2033 Leaves elliptical nearly entire thickish cartilaginous at edge, Umb 2-3-fl erect, Cal tubular obtuse
2034 Leaves ovate entire stalked smooth, Umb erect 3-fl Cal campanulate, Cor cyathiform
2035 Leaves wedge-shaped shining many-toothed at end, Scape about 1-fl Petals half bifid like a Y
2036 Leaves stalked ovate cordate rugose, Umbel proliferous, Cal inflated
2037 Lvs. lan obov tooth. stlk. beneath nearly nak Um few-fl erect, Lvs of inv lan Pet obov short. than tube
2038 Resembles P. farinosa. Distinguished by its flat corolla, and more robust habit
2039 Leaves obovate oblong close toothed smooth somewhat wavy, Umb pubesc Cal ovate gaping, Cor flat
2040 Leaves obovate spatulate beneath and scape mealy, Segments obcordate toothed
2041 Leaves obovate tongue-shaped entire vill. viscid, Umb many-fl erect, Leaves of inv ovate short membr
2042 Leaves flat coarsely serrated acute, Cal viscid, Pedicels longer than scape

and Miscellaneous Particulars

agreed on by the general consent of florists, they were first brought forward by the Dutch, and are now to be found in the treatises on florists' flowers of all countries. one of the best in this country is Maddocks's Florist's Directory.

The culture of P. veris as a border flower is abundantly simple, as it will grow any where, but best in a situation shaded from the mid-day sun, and in a loamy soil, but its culture as a florists' flower, the crossing to procure new varieties, and all the various cares of the florist involve details much too tedious for this work, if they were to be given at such length as to be of real use We refer to Maddocks, Emerton, and Hogg, and to the Encyclopedia of Gardening.

P. elatior is found in the same situations as the primrose, but is much less common than either it or P veris, It has little or no smell. Sir J E Smith considers it as probably a hybrid between the cowslip and primrose. There are two or three varieties of oxlip, but they are not considered as florists' flowers.

P. veris smells more strongly of anise than the primrose Its leaves have been used as a pot-herb, and in salads, and are recommended for feeding silk-worms The flowers make a pleasant wine, flavored like muscadel, but considered somniferous. Liquors and syrups are sometimes tinctured with the leaves. Having been less cultivated than the primrose, there are but few varieties of this plant in gardens. They may be raised from seed, however, to any extent, as Messrs. Gibbs, of the Brompton nursery, and others, have lately proved.

P auricula is a well known favorite of the florist. It is a native of the alpine regions of Italy, Switzerland, and Germany, and found also about Astracan. The most common colors in its wild state are yellow and red, sometimes purple, and occasionally variegated or mealy The cultivated are innumerable, and many of them of exquisite beauty and fragrance. The leaves in different varieties differ almost as much as the flowers, a circumstance which does not take place to the same extent in the variations of P vulgaris or veris. Near most of the manufacturing towns of England, and many in Scotland, the culture of this flower forms a favorite amusement of weavers and mechanics. Lancashire has been long famous for its auriculas it is no uncommon thing there for a working man who earns, perhaps, from 18s. to 30s per week, to give two guineas for a new variety of auricula, with a view to crossing it with some other, and raising seedlings of new properties.

History, Use, Propagation, Culture,

As to the soil proper for auriculas and polyanthuses, much has been written, and some highly artificial compositions of bullock's blood, sugar-baker's scum, night-soil, fuller's earth, &c recommended. Many of the most successful growers, however, use nothing more than a loam from an old pasture or hedge-row, kept and turned over occasionally during a year, and then mixed with hot-bed dung rotten to a mould, or with leaf-mould, and some sand to keep it open The soil and manure must be well mellowed by time before using, and not mixed till it is wanted, as that is said to generate worms. (See *Encyc of Gard.* art. *Primula*)

P auricula, helvetica, nivalis, and viscosa, are considered by Herbert as only varieties of one original, for he says he raised a powdered auricula and a P helvetica from P nivalis, and a P helvetica from P viscosa. (*Hort. Trans.* IV 20) These, and the other species of this genus, are well adapted for being kept in pots of loam and leaf-mould, or loam and peat well drained, and in frosty or wet weather during winter, protected by a frame to imitate their natural covering of snow in alpine regions Sweet says, "they require to be shifted and parted frequently, for if left too long without these being done, they will dwindle away and die." The best time for parting and shifting is after they have done flowering

P scotica, a pretty plant, resembling P farinosa, has lately been discovered in Scotland by Dr. Hooker, professor of botany at Glasgow

351 *Cortusa.* So named by Mathiolus, in honor of his friend J A. Cortusus, who first noticed it. This is a handsome little alpine, requiring a similar treatment to the Swiss Primulæ

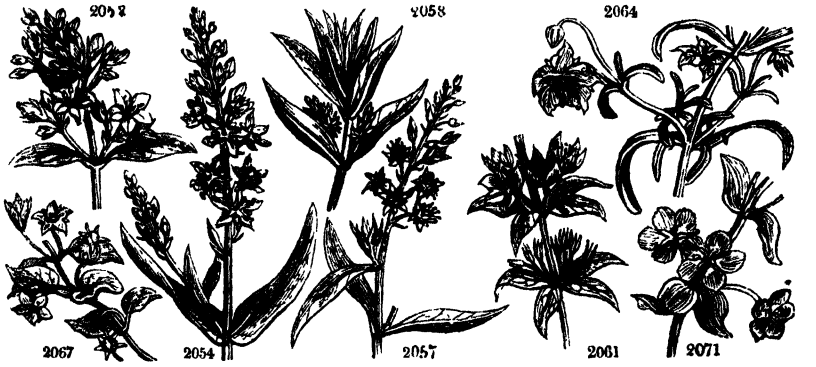
352. *Soldanella.* The diminutive of *solidus*, a shilling The round leaves of these plants are very like pieces of money They are among the least and most beautiful of alpine plants, and remarkable for the manner in which their corolla is cut or lacerated. Culture as in the Swiss Primulæ.

353. *Dodecatheon* A name of the Romans, signifying 12 gods or divinities, applied with apparent inaptitude by Linnæus to a plant, native of a world the Romans did not know, and resembling in no particular that of their writers. It was originally named Meadia by Mark Catesby, in honor of Dr. Mead, but the name was continued only as a specific appellation by Linnæus It is very ornamental when in flower; afterwards the leaves die away, and the root only remains till next season It is not easily kept; but thrives better in a bed of light loamy soil, in a shady and rather moist situation, than in pots.

354. *Cyclamen* Derived from κυκλος, a circle, on account of the numerous coils of the fruit-stalks. This genus consists of humble plants with very beautiful flowers In the north of Italy wild swine feed on its

2043 The only species

2044 Cor funnel-shaped spreading out beyond the middle, Calyx erect, Style shorter than corolla
2045 Cor. cylindrical bell-shaped not cut so far as the middle, Cal. spreading, Style longer than corolla



2046 The only species. Leaves radical flat on the ground, Scape bearing at top an umbel of drooping flowers

2047 Leaves orbicular cordate entire, Segments of cor ovate
2048 Leaves orbicular cordate crenate or toothed, Segm of cor lanceolate
2049 Leaves oblong ovate cordate or reniform-cordate crenated, Segm. of cor oblong obtuse
2050 Leaves cordate oblong acuminate angular toothed, Segm. of cor oblong lanceolate rather acute
2051 Leaves cordate crenulate emarginate, with the base overlapping, Flower short, Style exserted

2052 Flowers vertical stalked, Leaves under water all finely cut

2053 Racemes terminal compound, Leaves opposite 3-4 together oblong lanceolate
2054 Racemes terminal, Petals obovate spreading, Leaves linear lanceolate sessile
2055 Smooth branching, Leaves opp or whorled long linear spotted, Raceme terminating a short scape
2056 Racemes terminal, Petals conniving, Stam shorter than corolla, Leaves lanceolate stalked
2057 Racemes terminal, Petals lanceolate spreading, Leaves lanceolate sessile
2058 Racemes axillary stalked ovate compact, Leaves opp lanceolate
2059 Smooth, Stem simple spotted, Leaves opp sess lanc acute spott Flowers in close heads
2060 Leaves 3-4 together ovate lanc stalked pub beneath, Ped axill whorled, Pet ovate fringed with glands
2061 Leaves whorled obl lanc stalked, Pet ovate acute glandular, Stem pubescent
2062 Leaves subsessile 4-5 together oval acuminate dotted, Peduncles four, 1-flowered, Petals oval entire
2063 Pub Lvs opp on long stalks cord ovate, Fl -stalks axill in pairs, Fl cernuous, Petals rounded crenulate
2064 Smooth much branched, Leaves linear very long, Segments of cor serrulate
2065 Smooth, Leaves opp on long stalks lanc Petioles ciliated, Fl cernuous, Cor shorter than cal Pet cren.
2066 Leaves lanc sessile, Peduncles axillary opp Stem much branched smooth, Cal longer than corolla
2067 Leaves ovate acute, Flowers solitary, Stem procumbent, Stamens smooth
2068 Leaves opposite roundish cordate, Pedunc axillary 1-flow Stem smooth creeping, Stamens glandular

2069 Stem procumbent, Leaves 3-nerved ovate lanceolate petals dilated at end crenate with glands
2070 Leaves 5-nerved ovate lanceolate, Stem erect a little winged, Petals toothed at end
2071 Leaves lanceolate about 3 together sessile, Stem shrubby at base rounded, Branches diffuse angular
2072 Leaves cordate stem-clasping, Stem brachiate erect

and Miscellaneous Particulars

bulbs, which are round, flattened, and solid, and as large as pigeons' eggs When the flowers fade the pedicels twist up like a screw, inclosing the germen in the centre, and, lying close to the ground among the leaves, remain in that position till the seeds ripen The plant is peculiarly adapted for pots, and for chamber decoration in spring C hederæfolium is very scarce, and agreeably fragrant C persicum is tender; the others are quite hardy

355 *Hottonia* In honor of Peter Hotton, a professor in the university of Leyden, born in 1648, died in 1709. He wrote several academical dissertations, and published remarks upon medicinal plants, valuable in their day. *Plume d'eau*, Fr. *Wasserviole*, Ger, and *Myriofillo aquatica*, Ital This singular aquatic has roots consisting of white capillary fibres, which strike deep into the mud. The leaves grow in tufts under the water, and only the upper part of the flowering stem rises above it, producing a showy spike of white and blue flowers. It affords refuge to the fresh-water periwinkle (*Turbo Littoreus*), and other small shellfish. The seeds being sown in a pond when ripe, the plants will rise in the water the spring following.

356. *Lysimachia* From λυσις μαχη, of which the English name Loose-strife is a translation; it has been given to this plant from the quality absurdly ascribed to it by the ancients, of quieting restive oxen when put upon their yokes Linnæus says it was named after king Lysimachus of Sicily, who first used it, which account is nearly the same as that of Pliny Most of the species are bog or fen plants, of the easiest culture. L. nummularia is ornamental on moist rock-work or hanging from a pot in a northern exposure Though one of the hardiest natives, it seldom produces ripe seeds, like most plants which multiply themselves much by the roots or stem. The flowers of L. thyrsiflora come out in lateral bunches from the axils towards the top of the stem, which Linnæus notices as a singular circumstance in an upright plant. L. stricta, after flowering, throws out bulbs from the axils of the leaves, which, if allowed to lie on a moist surface, will produce young plants the following spring L. dubia requires to be treated like a tender annual.

357. *Anagallis* From αναγελαω, to laugh; the name expressing the medicinal qualities of the plant, which, by removing obstructions of the liver, removed a cause of low spirits and despondency, so at least say Pliny and Dioscorides. A. arvensis is a beautiful trailing weed, and one of the Floræ horologicæ, opening its flowers regularly about eight minutes past seven o'clock in our latitude, and closing about three minutes past two o'clock. It also serves as an hygrometer, for if rain fall, or there be much moisture in the atmosphere, the flowers either do not open, or close up again. Small birds are very fond of the seeds. A monelli is a very

History, Use, Propagation, Culture,

beautiful small plant, and, with A latifolia and linifolia, require the protection of a frame during winter. A. tenella is a delicate bog-plant, but not a very certain tenant of the genus It is probably botanically distinct.

358. *Diapensia* An ancient Greek name of the Sanicle, and signifying a plant which removes pain; the Sanicle being a vulnerary. Linnæus applied the name to this plant, which is neither a Sanicle nor a vulnerary, but a pretty alpine species, requiring the same cultivation as similar things, and retaining its deep green leaves through the severest winters

359 *Pyxidanthera* From πυξὶς, a box, and ἀνθηρὰ, an anther, the anthers bursting across like a little box. A small plant resembling Azalea procumbens, with heath-like leaves and minute white flowers It is found on the White-Mountains of New Hampshire, and in Pine-barrens in other parts of North America, but is very rare in cultivation.

360 *Coris* A name of Dioscorides, for which even the etymological ingenuity of a Linnæus or a De Théis have been unable to provide a meaning It was given to a plant analogous to Hypericum, and resembling the heath. Tournefort applied the name to this plant, whose fine leaves, and purple or pink flowers, clothe, like the heath, the places where it grows wild

361 *Galax* From γαλὰ, milk, in allusion to its milk-white spikes of flowers. This is a neat little plant, and thrives best in a moist situation; where alone it flowers freely

362. *Menyanthes.* From μὴν, a month, and ἄνθος, flower, in allusion to the power which the plant is supposed to possess of exciting menstruation *Buck-bean or Bog-bean*, Eng., *Bachsbohne*, Ger. An infusion of the leaves is bitter, and is frequently recommended in dropsy and rheumatism. In Sweden the plant is used

2073 Leaves linear lanceolate opp. or whorled, Stems ascending
2074 Leaves sessile opposite 3-4 together lanceolate 3-nerved, Sepals linear acute, Cor. twice as big as calyx
2075 Leaves ovate acute, Stem creeping, Stigma acute

2076 The only species Plant growing in dense tufts

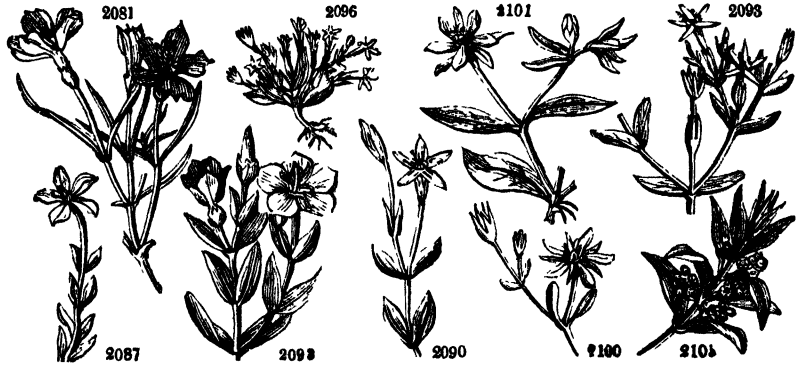
2077 A small plant resembling Azalea procumbens

2078 The only species

2079 The only species Roots deep red. Flowers in long slender spikes

2080 Leaves ternate

2081 Leaves cordate orbicular floating, Flowers umbelled, Corollas fringed
2082 Leaves reniform subpeltate beneath full of holes floating, Petioles flower-bearing, Corollas smooth
2083 Runners creeping, Leaves cordate roundish repand dotted beneath, Panic opp the leaves, Seeds smooth
2084 Leaves cordate roundish nerved floating, Petioles flower-bearing, Corolla hairy within
2085 Leaves radical cordate roundish spreading toothed, Stem long naked, Flowers panicled
2086 Leaves ovate erect, Flowers in panicled racemes fringed



2087 Leaves lanceolate smooth, Stem herbaceous 4-cornered cernuous
2088 Stem simple, Leaves linear-lanceolate
2089 Herbaceous, Leaves linear erect, Branches fastigiate, Peduncles elongated
2090 Leaves linear-lanceolate smooth spreading, Stem much branched shrubby, Fruit a berry
2091 Leaves linear spreading, Cal ovate closed, Cor clammy, Segm cuneate pointed
2092 Shrubby, Leaves lanceolate subtomentose, Calyxes campanulate
2093 Shrubby subtomentose, Leaves close together decussate oblong obtuse, Cal. globose 5-parted

2094 The only species

2095 Stem herbaceous dichotomously panicled, Leaves ovate lanceolate, Cal shorter than tube
2096 Flowers stalked, Segments of cal shorter than tube, Style simple, Leaves ovate
2097 Stem nearly simple dwarf, Flowers clustered sessile, Cal as long as tube of cor Leaves lin lanc
2098 Herbaceous, Leaves oblong-lanceolate, Stem dichotomous corymbose rounded, Flowers stalked digynous
2099 Dwarf upright much branched, Lvs oval obtuse, Fl sessile fasc clustered, Cal ½ as long as tube of cor

2100 Weak, Branches lax elongated 1-flowered, Leaves linear ellipt Pet obovate, Stem angular
2101 Erect leafy, Leaves oblong, Flowers solitary about 7-parted, Cal leafy longer than cor
2102 Weak, Leaves lanc erect, Branches few 1-flowered, Flowers 7-13-parted, Sepals linear shorter than cor
2103 Erect, Leaves lanc. linear, Pan many-flowered brachiate, Cal subulate three as short as cor

2104 Leaves obovate acute at each end, Flowers corymbose, Branches smooth, Stem erect
2105 Leaves lanceolate attenuate at each end smooth, Stipules lateral setaceous. Racemes axillary compound

and Miscellaneous Particulars

as a substitute for hops, two ounces of the leaves being substituted for a pound of hops The powdered roots are sometimes eaten in Lapland The only species cultivated is the wild plant of our rivulets.

363 *Villarsia* A genus divided from the last, and named after Villars, a French botanist of repute, who wrote the Flora of Dauphiny, in 1786, a work used even at the present day This is an aquatic genus of easy culture, and increased by seeds or dividing at the root. V nymphoides is one of the most elegant of British water-plants.

364 *Chironia* Named after Chiron, one of the fathers of medicine, botany, and surgery He is mythologically represented to have been the son of Saturn, or of Time and Experience. Many plants, the virtues of which he is believed to have first discovered, have borne his name The genus, however, to which it is now applied, is probably not one of those It consists of pretty plants of short duration, generally with pink flowers The species are not long-lived plants, and therefore require to be frequently raised from cuttings. Peat mould suits them best, and a little loam mixed with it; and young cuttings planted in the same kind of soil, under hand-glasses, strike root readily

365 *Eustoma* From *ευ*, well, and *στομα*, mouth or orifice, in allusion to the colored aperture of the tube of the flower. A pretty little plant rarely seen in gardens. It resembles a Sabbatia.

366. *Erythræa.* From *ερυθρος*, red, in allusion to the color of the flowers This is a pretty genus of herbaceous and annual flowers, but impatient of cultivation, and therefore rarely seen in gardens.

367 *Sabbatia* Named after Liberatus Sabbati an Italian botanist, author of many works on botany In 1772 he published the first volume of the Hortus Romanus, a fine work, in folio, of which the seventh and last volume appeared in 1784 A pretty N American genus of plants resembling Chironia

368. *Logania* Named by Mr Brown, after a Mr James Logan, said to have been the author of some experi-

History, Use, Propagation, Culture,

ments upon the generation of plants. Small bushes or herbaceous plants with opposite entire leaves, and terminal or axillary bunches of white flowers. Eleven species, natives of New Holland, are described. Ripened cuttings may be struck in sand under a hand-glass

369. *Phlox.* From φλαξ, flame. The plant so named by the ancients is supposed to have been an Agrostemma. The genus now so called is a native of North America only, and is one of the handsomest in cultivation It consists of most elegant border flowers, valuable for blossoming late in the season, and for their lively colors of red, white, and purple, while the majority of plants that flower in autumn have yellow, and generally syngenesious blossoms. Most of the species delight in a rich moist soil, or loam and leaf mould or peat. The dwarf species are admirably adapted for pots, or a select rock-work · they require some protection in severe winters.

370. *Polemonium.* From πολεμος, war. Pliny relates, that the plant which he called by this name received its appellation from having been the cause of a war between two kings, who could not agree which of them first discovered its virtues. It was also called Chilodynamia (from χιλιοι, a thousand, and δυναμις, power), on account of its extraordinary merit. The plant which possessed all these good qualities is now forgotten. Its name has descended to a flower which ornaments the garden, but which preserves nothing of the virtue of its progenitor, beyond a slight vulnerary quality. P cærulcum is a border flower of long standing, and of the easiest culture.

371. *Vestia.* Named by Willdenow, in his Enumeratio Plantarum, in honor of his friend Dr. Vest of Clagen-

2106 Leaves lanc. flat rough at edge, Stem smooth, Corymbs panicled, Segments of cor rounded

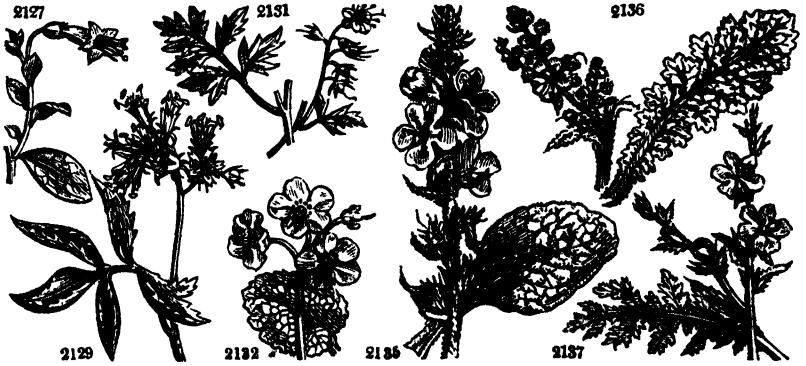
2107 Leaves obl. lanc. somewhat wavy rough at edge, Stem smooth, Corymbs panicled, Segm. of cor blunt
2108 Erect pubescent, Leaves ovate acum beneath pubescent decussate, Cor panic Segm. of Cor. rounded
2109 Erect, Stem smooth not spotted, Leaves ovate lanc. quite smooth, Racemc panic. Teeth of cal. erect
2110 Erect, Stem rough spotted, Leaves obl. lanc. smooth rough at edge, Pan. obl close, Teeth of cal. recurved
2111 Leaves cordate ovate acute smooth, Flowers densely pyramidal, Teeth of cal. upright, Stem spotted
2112 Hairy, Stem erect, Leaves linear-lanceolate, Sepals subulate, Tube of cor. curved pubescent
2113 Hairy, Stems assurgent, Leaves ovate lanceolate, Sepals subulate, Tube of cor smooth straight
2114 Leaves lanceolate sessile smooth thick, Stem erect rough, Flowers whorled terminal
2115 Stems erect subpubescent, Leaves lanc. smooth, Branches of corymb 3-flowered, Teeth of cal linear
2116 Leaves lanc shining on both sides acute nearly without veins, Stem smooth trifid above shrubby at base
2117 Tufted assurgent smooth, Leaves linear lanceol. smooth, Corymb term fastigiate, Teeth of cal. mucron.
2118 Dwarf diffuse pubescent, Leaves ovate lanc. chiefly alternate, Branches few-fl lax, Cal. subul. Pet. cord.
2119 Stoloniferous pubescent, Fertile stems erect simple few-leaved, Leaves oval, Corymb few-flowered
2120 Leaves ovate, Flowers solitary
2121 Dwarf tufted pubescent, Leaves fascicled subulate pungent ciliated, Pedicels few terminal
2122 Leaves ciliated lowest setaceous upper lin. lanc. Branches 3-5-fl. at end, Cal. spreading hairy, Pet. retuse

2123 Stem erect rounded, Leaves lanc smooth half stem-clasp Cal. edged, Tube of cor. twice as long as limb

2124 Pinnæ 7, Flowers terminal nodding
2125 Leaves pinnate, Flowers erect, Cal. longer than tube of corolla

2126 Pinnæ many the terminal 3-lobed, Flowers nodding, Cal. viscid

2127 The only species



2128 Very hairy, Radical leaves subpinnatifid, cauline lobed angular, Sinus of calyx with reflexed appendages
2129 Leaves pinnate or pinnatifid, Segm. ovate lanceol. cut serrate, Fascicles of flowers clustered
2130 Smoothish, Leaves lobed angular, Fascicles of flowers close together

2131 Erect, Leaves pinnatifid, Segments cut lobed, Racemes generally bifid

2132 A stemless plant with hoary leaves and short scapes of purple flowers The only species

Leaves decurrent

2133 Lvs. cren toment. upper acute, Raceme spiked dense, Cor rotate with obl obt. segm. Anth. nearly equal
2134 Lvs. cren toment upper acumin Raceme spiked dense, Cor rotate with obov round segm. 2 of anth obl.
2135 Lvs. cren tom. radic. ell. stlkd. Caul. obl. ac upper brd ov cusp slightly decur Fasc. remotish, Two an obl.
2136 Leaves toment. radical and lower cauline sinuated upper crenate slightly decurr Spikes pan. Fl clustered
2137 Leaves bipinnatifid [Fasc of rac remote, Two anth obl.
2138 Leaves crenate tom. Radic. obl lanc narr. to stalk, Caul. obl. acute decurr upper broad ov cusp ½ decur
2139 Leaves tom. radic. ellipt. narr. at base uneq. doubly crenate, Caul. obl. acute simply crenate upper round. ovate cusp slightly decurr Racemes dense, Two anthers oblong
2140 Leaves ½ decurrent crenate snow-white, Raceme spiked dense, Anthers equal
2141 Leaves crenulate tomentose the upper cuspidate, Fascicles of raceme remote, Two anthers oblong
2142 Leaves cren. tom. rad. ellipt. obl. narr. at base caul. obl. acute ½ decurr. Fasc. of rac rem. Two anth. obl.

and Miscellaneous Particulars.

furth. A native of Chili, with pale-green smooth leaves, and pale yellow flowers. It is very nearly related to Lycium.

372. *Hydrophyllum.* From ὕδωρ, water, and φύλλον, a leaf. This plant grows in the marshes of North America, and in the spirng time has a small quantity of water in the cavity of each leaf. The species are two only, both humble plants, with neat foliage, which protects the small white flowers. H. virginicum is used as a salad, under the name of Shawanese salad in North America.

373. *Phacelia.* From φακελος, a bundle, the flowers being disposed in fascicled spikes.

374. *Ramonda.* Named after M. L. Ramond, a French botanist, who discovered many new plants in France A very pretty dwarf plant, kept in a frame with other alpine plants. Formerly a species of Verbascum, (V. myconi.)

375. *Verbascum.* An alteration of *barbascum*, on account of the beard (barba) with which all the leaves and stems are closely covered. The species are all very fine looking plants, well calculated for shrubberies, among other tall plants. They have been well illustrated by M. Schrader in a learned Monograph. V thapsus has been so called from its native place, the Isle of Thapsos. V. blattaria is said to have the power of driving away the blatta or cockroach. V. pulverulentum is one of the most magnificent of native herbaceous plants, sending up a stem a yard high, covered with many hundreds of gold colored flowers. Correa observes of this golden rod, that in still weather two or three blows with a stick will bring down all the corollas. The nap of

History, Use, Propagation, Culture,

this species, of V. lychnitis, and of several others, may be used as tinder, and to make wicks for lamps, whence the name Lychnitis applied to one of the species, from λυχνος, a lamp Several mules have been produced between the species of this genus, and it has been questioned whether those accounted species are not productions of this kind

376. *Datura* An alteration of the Arabic name *tâtôrah*, Forskahl About Goa and Canara, it is called Daturo, Rumphius *Stramonium* is an abbreviation of the Greek word στρυχνομανικον, or mad-apple, on account of the dangerous effects of the fruit of that species *Metel* or *Methel*, is an Arabic name employed by Serapion, ch 375, and expresses the narcotic effect of the plant *Tatula* is altered from Datula, a name given to the Datura by the Turks and Persians D stramonium is an instance of a South American plant, naturalized within a comparatively short time, the seeds having been introduced from Constantinople in Gerarde's time, and by him "dispersed through this land" Kalm says, that this plant and a species of Phytolacca are the worst weeds in America Professor Martyn observes, that "in the earth brought with plants from various parts of that extensive country, we are sure to have the thorn-apple come up" At night, the leaves next the flowers rise up and enclose them The whole plant smells strongly of bean meal Every part of the plant is poisonous, bringing on delirium, tremors, &c but under proper regulations it is a useful medicine in asthma, &c

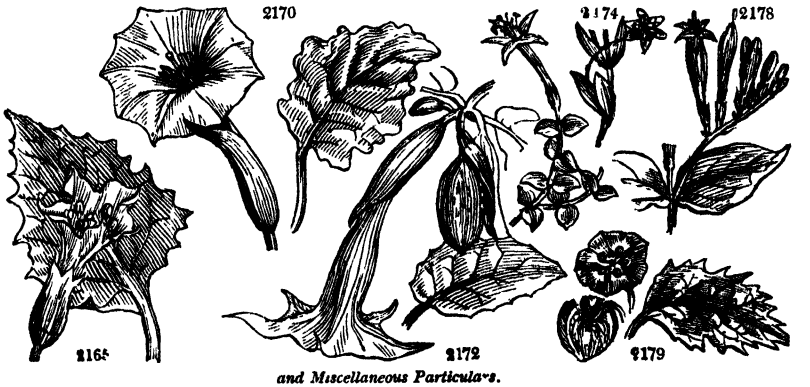
D fastuosa has a fine polished purple stalk, varied with dots or lines; the leaves are large, the flowers of a beautiful purple outside, and a satiny white within, some are single, others semidouble They have an agreeable odor at first, but if long smelt to become less agreeable, and are narcotic D ceratocaulon is a fine species; its seed will sometimes remain in the ground several years before it will vegetate

377 *Brugmansia* So named by Persoon, in honor of Professor S J Brugmans, author of some botanical works, and especially of a dissertation "De Plantis Inutilibus, et Venenatis," published at Groningen, in 1783.

B. arborea is one of the greatest ornaments of the gardens of Chili. The flowers which come out at the

Leaves sessile.

2143 Stem erect simple, Leaves oval sessile tooth-crenate smooth above, Flowers spiked
2144 Leaves sublyrate, Flowers sessile
2145 Leaves ½ decurrent tomentose on both sides, Stem branched, Three filaments hairy in the middle
2146 Leaves nearly naked lower oblong attenuated at base upper cord acum. sess. Racemes panic. Stam beard.
2147 Leaves ovate oblong at base atten toment obsoletely cren. Racemes spiked elongate, Fl. without bractes
2148 Leaves ovate sessile beneath closely woolly, Stem branched, Filaments bearded
2149 Leaves wedge-shaped oblong naked above, Stem angular panicled
2150 Leaves ovate oblong subserrate powdery on both sides, Stem rounded panicled, Hairs of stamens white
2151 Leaves subvillous rugose cauline subsessile equally crenate, Radical oblong cordate doubly crenate
2152 Stems virgate simple, Leaves cordate ovate rugose crenate woolly beneath, Pedunc. with 1 bract. solitary
2153 Leaves oblong cordate stalked wavy crenate subpubescent
2154 Leaves naked radical uneq toothed, Caul lanc. toothed wedge-shaped at base, Stem naked, Rac. elong.
2155 Leaves oblong lanc toothed sessile radical sublyrate pubescent, Stem branched, Flowers aggreg. sessile
2156 Leaves stem-clasping oblong smooth doubly serrated, Peduncles 1-flowered solitary
2157 Leaves naked lower obl stalked upper obl lanc Stem simple pub Raceme term Stalks altern very short
2158 Leaves naked radical sinuated cauline oblong cordate stem-clasping coarsely toothed, Pedunc. alternate
2159 Leaves tomentose radical bipinnatifid cauline pinnatifid, Flowers clustered sessile
2160 Leaves cut naked, Stem leafy, Calyxes woolly, Pedunc. 2-flowered
2161 Leaves ovate oblong beneath hoary the lower narrowed at base upper subcordate, Racemes lax panicled
2162 Leaves cordate acuminate, Spike lax downy, Two lower stamens declinate smooth
2163 Stem leafy prickly shrubby



2164 The upper spines very large converging at the top of the pericarp
2165 Leaves ovate smooth angular toothed, Pericarp prickly
2166 Leaves ovate subcordate smooth angular toothed, Stem spotted, Pericarp prickly
2167 Leaves ovate angular, Pericarps tuberculated nodding
2168 Leaves cordate nearly entire pubescent, Pericarps prickly globose nodding
2169 Leaves ovate angular toothed smooth, Stem hollow herbaceous, Pericarps smooth erect
2170 Leaves ovate lanceolate wavy beneath hoary, Stems dichotomous cornute, Pericarps obovate pendulous

2171 Leaves oblong entire smooth, Calyxes 5-toothed
2172 Leaves oblong entire powdery, Stalks and branches pubescent, Cal. spathaceous acummate

2173 Leaves lanceolate acute pubescent, Stem rounded
2174 Leaves ellipt lanceolate obtuse smooth, Stem rounded, Peduncles long 1-flowered
2175 Leaves ovate lanc pedunc. trichotomous, Genitals very long
2176 Leaves cordate

2177 Stem herbaceous the upper leaves 4 together
2178 Stem simple, All the leaves opposite sessile lanceolate oval

2179 Leaves sinuated, Calyxes closed acute-angled

and Miscellaneous Particulars.

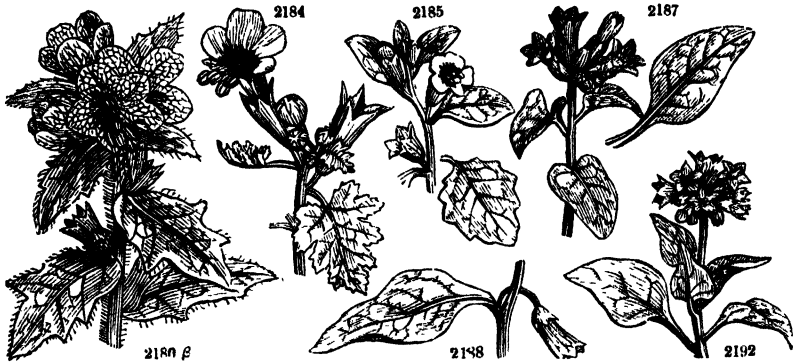
divisions of the branches, have a loose tubular calyx nearly four inches long, which, opening like a spathe, a corolla is protruded, with a narrow trumpet-shaped tube, which spreads wide at the brim, where it is divided into five angles, which terminate in very long points they are white within, pale yellow outside, and one tree will perfume the air of a large garden It flowers freely in the bark-stove, in a moist heat.

378 *Lisianthus* From λυσις, dissolution, and ανθος, a flower, a name given to the plant on account of the medical virtues possessed by it of dissolving humours It is a powerful cathartic. The species are very handsome stove plants Cuttings root readily in sand under a bell-glass

379 *Spigelia.* So named by Linnæus, in honor of Adrian Spigelius, born at Brussels in 1578, professor of anatomy and surgery at Padua, author of Isagoge in rem Herbariam, died in 1625

S. anthelmia is so named from its peculiar efficacy in destroying worms, for which it has been long in use among the negroes in the West Indies Dr. Browne, after a number of successful experiments, says it operates in so extraordinary a manner, that no other simple can be of equal efficacy in any other disease, as this is in those which proceed from these insects. (*Hist. of Jamaica*) The same plant procures sleep almost as certainly, and in an equal degree with opium.

S. marilandica is used as a vermifuge in North America, and according to Dr Garden, (*Letters to Dr Hope,*) with very powerful effects. The annual plant may be treated like other tender annuals, but S. marilandica is rather difficult to preserve, according to Sweet, "it requires to be grown in a pot, that it may be protected from severe frosts, or too much wet: it will sometimes survive the winters when planted in the open ground in a bed of peat: the best soil for it is an equal mixture of loam and peat, and young cuttings, planted under a hand-glass, root readily" (*Bot. Cult.* 424.)



380. *Nicandra* Nicander was a Greek physician, who lived about a century and half before Christ. The genus was formed by Adanson, it consists of the Atropa physaloides of Linnæus. The Indians of Peru make use of the berries of this plant to bring away gravel, and to relieve persons who have a stoppage of urine

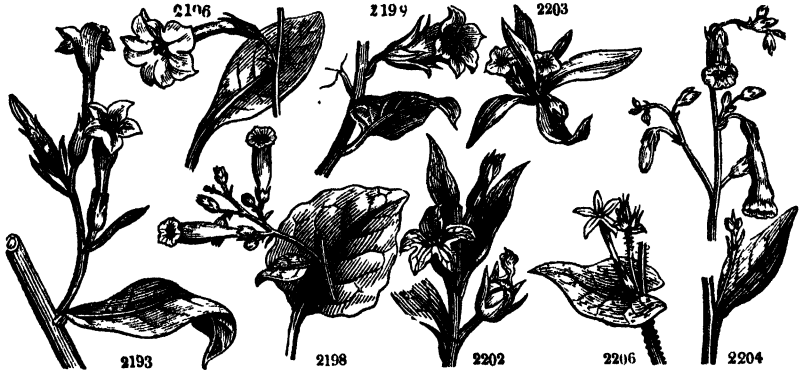
History, Use, Propagation, Culture,

381 *Hyoscyamus.* From *ὑς ὑος*, a pig, and *κυαμος*, a bean, the fruit has been thought to resemble a bean, and, although dangerous to other animals, is said to be eaten by pigs with safety H. niger is a well-known fœtid weed, which follows civilized man, growing on rubbish of old houses, dunghills, &c It has a strong peculiar odor, greatly affecting the heads of some persons, and the whole plant is reputed poisonous Sir J E. Smith and Professor Martyn say they have often eaten the seeds without suffering inconvenience Lightfoot, on the contrary, says, a few of them have been known to deprive a man of his reason and limbs A species of bug (Cimex) and of beetle (Chrysomela) take their specific names from feeding on the plant; but no quadruped is known to eat it, unless the goat and sheep, and that very rarely and sparingly As a medicine, henbane is of immemorial use, and is still continued in the Pharmacopœias It is given with or without opium in coughs, epilepsy, convulsions, &c Country people sometimes smoke the leaves for the toothach.

382. *Nicotiana* So named from John Nicot of Nismes, in Languedoc, ambassador from the king of France to Portugal, who procured the seeds from a Dutchman who had received them from Florida The first plant was said to have been presented to Catherine de Medicis, whence the French name *Herbe à la Reine* The name tobacco, which has superseded all others, is the appellation of a district of Mexico *Petum* or *Petume*, Bras, *Tabac*, Fr, *Taback*, Ger, and *Tabac*, Ital The species grown as tobacco are the N tabacum and rustica; the former greatly preferred. The popular narcotic which it furnishes is probably in more extensive use than any other, and its only rival is the betel of the east. According to Linnæus, tobacco was known in Europe from 1560. It was brought to England from Tobago in the West Indies, or Tobasco in Mexico, (and hence the name,) by Ralph Lane, in 1586, but only the herb for smoking. Afterwards, according to Hakluyt, seeds were introduced from the same quarter Sir Walter Raleigh first introduced smoking; in the house in which he lived at Islington are his arms on a shield, with a tobacco plant on the top. Smoking has consequently been common in Europe for upwards of two centuries. It is a powerful narcotic, and also a strong stimulant with respect to the whole system, but especially to the stomach and intestines, to which, in small doses, it proves emetic and purgative The smoke thrown up the anus acts as a glyster an infusion of the leaves forms a powerful lotion for obstinate ulcers the oil applied to a wound, is said by Redi to be as fatal as the poison of a viper. The decotion, powder, and smoke of tobacco, are used in gardening to destroy insects, and in agriculture for the same purpose, and to cure cutaneous eruptions in domestic animals.



Tobacco, as used by man, says Du Tour, (*Nouveau Cours d'Agriculture*, &c) gives pleasure to the savage and the philosopher, to the inhabitant of the burning desert and frozen zone In short, its use either in powder, to chew, or to smoke, is universal, and for no other reason than a sort of convulsive motion (sneezing) produced by the first, and a degree of intoxication by the two last modes of usage. A hundred volumes, he adds, have been written against it, of which a German has preserved the titles. Among these books is that of James Stuart, king of England, who violently opposed it The Grand Duke of Moscow forbade its entrance into his territory under pain of the knout for the first offence, and death for the next. The emperor of the Turks, king of Persia, and Pope Urban VIII issued similar prohibitions, all of which were as ridiculous as those which attended the introduction of coffee or Jesuit's bark. At present, all the sovereigns of Europe, and most of those of other parts of the world derive a considerable part of their revenue from tobacco.

Tobacco is cultivated in Europe as far north as Sweden, and is also grown in China, Japan, and other eastern

2180 Radic. leaves sinuated pinnatifid upper stem-clasping, Flowers nearly sess. Cor. netted

2181 Leaves stalked the lowest rounded entire the rest cordate ovate sinuate toothed, Fl. axill. sess. or stalked
2182 Cauline leaves stalked cordate sinuate acute, Flowers entire inflated

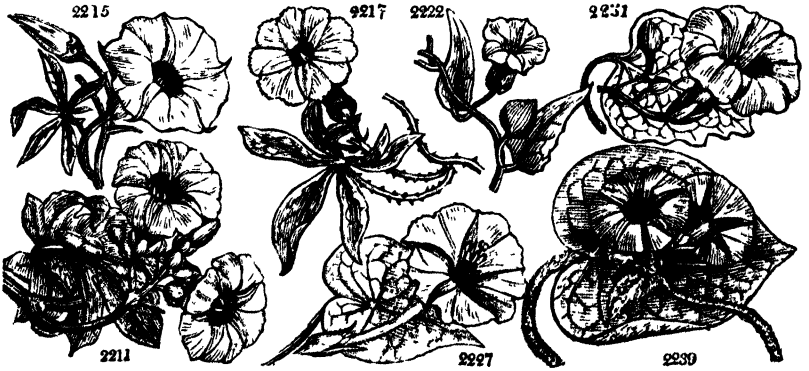
2204 Lower leaves ovate obtuse stalked upper sessile decurrent, Tube of cor clavate long, Limb obtuse
2205 Stem branc at base, Lvs stlkd. all cord ent. Tube of cor. clav pub much long than cal Seg. very sh acute
2206 Leaves stem-clasping cord. spat roundish repand, Tube of cor. slender very long, Segm ovate acute plic.

and Miscellaneous Particulars.



and hot countries. The sort preferred is the N tabacum, which is an elegant plant, grown also in gardens as a border flower. N rustica, *fausse tabac*, Fr, *Bauern taback*, Ger, and *Tabacca cimarosa*, Span, is also frequently cultivated, especially in Europe, it being considered hardier than the Virginian sort Parkinson says, he has known Sir Walter Raleigh, when prisoner in the Tower, prefer it to make good tobacco, "which he knew so rightly to cure" Tobacco has been successfully cultivated and cured in this country, but its growth is prohibited to encourage our commerce with America It is now only grown for curiosity as a border flower, or by gardeners for the destruction of insects In Germany and other northern countries, most families who have gardens grow enough of N rustica for their own use; but as they do not know how to cure it, it is not much valued, and is never made into chewing tobacco or snuff.

In the culture of Tobacco in America, the plants are raised on beds early in spring, and when they have acquired four leaves, they are planted in the fields in well prepared earth, about three feet distance every way. Every morning and evening the plants require to be looked over, in order to destroy a worm which sometimes invades the bud. When four or five inches high they are moulded up. As soon as they have eight or nine leaves, and are ready to put forth a stalk, the top is nipped off, in order to make the leaves longer and thicker, by directing all the energies of the plant to them. After this, the buds which sprout from the joints of the leaves are all plucked, and not a day is suffered to pass without examining the leaves, to destroy a large caterpillar, which is sometimes very destructive to them When they are fit for cutting, which is known by the brittleness of the leaves, they are cut with a knife close to the ground, and, after lying some time, are carried to the drying shed, where the plants are hung up by pairs upon lines, having a space between, that they may not touch one another. In this state they remain to sweat and dry When perfectly dry, the leaves are stript from the stalks and made into small bundles tied with one of the leaves. These bundles are laid in heaps, and covered with blankets. Care is taken not to over-heat them, for which reason the heaps are laid open to the air from time to time, and spread abroad This operation is repeated till no more heat is perceived in the heaps, and the tobacco is then stowed in casks for exportation. (*Long Jam.* iii. 719.)

In the manufacture of tobacco, the leaves are first cleansed of any earth, dirt, or decayed parts, next, they are gently moistened with salt and water, or water in which salt along with other ingredients has been dissolved, according to the taste of the fabricator. This liquor is called tobacco sauce. The next operation is to remove the midrib of the leaf, then the leaves are mixed together, in order to render the quality of whatever may be the final application equal: next, they are cut into pieces with a fixed knife, and crisped or curled before a fire; the succeeding operation is to spin them into cords, or twist them into rolls by winding them with a kind of mill round a stick. These operations are all performed by the grower, and in this state (rolls) the article is sent from America to other countries, where the tobacconists cut it into chaff-like shreds for smoking, by a machine like a straw-cutter; form it into small cords for chewing, or dry and grind it for snuff. In manufacturing snuff, various matters are added for giving it an agreeable scent, and hence the numerous varieties of snuffs The three principal sorts are called Rappees, Scotch or Spanish, and Thirds. The first is only granulated, the second is reduced to a very fine powder, and the third is the siftings of the second sort. The best Havannah segars are made from the leaves of N repanda. The Indians of the Rocky Mountains of N. America prepare their tobacco from N. quadrivalvis and N. nana.

History, Use, Propagation, Culture.

383 *Ipomœa* From ἰψ *ips*, a bindweed, or something analogous, and ὅμοιος *omoios*, similar. This genus is nearly allied to Convolvulus and Calystegia It consists chiefly of twining stove plants, free flowerers, and of the easiest culture I tuberosa is a plant of great beauty and fragrance. In Jamaica it is evergreen, thickly covered with leaves and large flowers, and much used to shade arbors Browne says it may be carried over an arbor of 300 feet in length Every part of the plant abounds with milk, and is purgative. Long thinks Scammony might be made from its tubers, and Loureiro affirms them to be edible.

§ 1. *Leaves pennate, digitate, or palmate.*

2207 Leaves pinnate pinnæ filiform, Peduncle a little longer than leaf 1-flowered
2208 Leaves palmate, Segments narrow pinnatifid toothed, Peduncle about 2-flowered
2209 Leaves digitate, Leaflets stalked, Peduncle 1-flowered
2210 Leaves palmate, Lobes 7 lanceolate acute entire, Peduncle 3-flowered
2211 Smooth, Leaves palmate, Lobes 7 oblong lanceolate entire, Cymes dichotomous, Cal. equal obtuse, Caps erect
2212 Leaves digitate in 5s hairy entire, Seeds smooth
2213 Leaves digitate in 7, Peduncles umbelled very short
2214 Leaves digitate or nearly pedate 7-parted smooth, Stalks warted rough, Peduncle 1-flowered
2215 Leaves palmate pedate, Lobes ciliate mucronate at end, Peduncle 1-flowered
2216 Leaves palmate, Flowers aggregate
2217 Branches peduncles and petioles tubercled, Leaves palmate, Lobes 7 narrow oblong with a short point

§ 2. *Leaves cordate, angular, or lobed.*

2218 Leaves obl cordate rarely obsoletely 3-lobed, Peduncle 1-fl. shorter than leaf, Calyx very smooth
2219 Leaves cordate 3-lobed villous, Peduncle 2-3-fl. Edge of cor nearly entire, Stigmas 3-lobed
2220 Branches petioles peduncles and calyxes bristly, Leaves naked cordate 3-lobed, Lobes tooth sinuated
2221 Stem twining, Leaves cordate 3-lobed, Peduncle longer than petiole, Fruit nodding
2222 Leaves cordate angular, Stem membranous square, Peduncles many-flowered
2223 Leaves cordate acuminate angular, Peduncle first dichotomous afterwards branching
2224 Downy, Lvs cord. acum at base angular, Peduncle 5-flowered, Cal warted bearded, Limb. of cor. entire
2225 Smooth, Lvs cord below obscurely repand or ang Peduncle short 1-fl Cal hairy ciliated, Cor small short
2226 Leaves cordate at the end 5-lobed smooth, Peduncle many-flowered corymbose

2227 Very smooth, Leaves cordate entire or angular, Peduncle 1-3-fl. Cal aristate, Cor undiv Tube very long
2228 Peduncle upwards cymose trichotomous longer than the 5-lobed cordate or hastate leaves
2229 Leaves cordate entire or 3-lobed acuminate above pubescent beneath villous, Flowers numerous in cymes
2230 Smooth, Leaves cordate acuminate entire, Peduncles many-flowered without bracteæ
2231 Stem warted, Leaves cord. ovate rugose villous beneath entire or lobed, Peduncle 1 many-fl Seed woolly

2232 Leaves 3-lobed, Flowers aggregate

§ 3 *Leaves cordate entire.*

2233 Leaves cordate acute entire, Peduncle 1-flowered solitary as long as leaves
2234 Leaves cordate, Peduncle many-fl. Outer calyx orbicular, Cor campanulate lobed
2235 Leaves cordate entire, Flowers close together, Cor undivided
2236 Leaves roundish cordate smooth, Peduncle many-flowered, Cor edged
2237 Leaves cordate oblong repand acuminate, Peduncles branched cymose
2238 Leaves cordate acuminate smooth, Peduncles 2-flowered
2239 Leaves cordate ovate acute above hairy, beneath silky, Peduncle longer than the stalks in umbels
2240 Leaves cordate undivided, Fruit cernuous, Stalks thick, Leaves cordate entire, Ped. many-fl Cal hispid

2241 Stem very tall, Leaves orbicular rounded, Flowers spotted with eyes
2242 Leaves 3-lobed cordate, Peduncles 3-flowered
2243 Leaves 3-lobed cordate, Peduncles many-flowered racemose
2244 Leaves cordate 3-lobed, Flowers half 5-cleft, Peduncles shorter than the petioles
2245 Hairy, Leaves cordate 3-lobed, lateral lobes acuminate intermediate acute, Peduncle 1-fl Cal hairy
2246 Leaves cordate 3-lobed, Lobes cuspidate, Peduncles 1-fl Sepals linear very hairy at base
2247 Leaves cordate acuminate hairy, Flowers aggregate
2248 Leaves cordate ovate obtuse entire, Peduncle about 2-fl Cal coriaceous, Stem and petioles pubescent
2249 Leaves cordate roundish with a long point smooth, Peduncle thick 3-fl and cal smooth, Stem muricated
2250 Leaves cordate acuminate, Peduncle filiform 1-fl and cal smooth, Stem very hairy

§ 4 *Leaves sagittate or hastate*

2251 Very smooth, Leaves oblong sagittate with a very deep sinus, Auricles acuminate, Peduncle 1-flowered
2252 Leaves linear hastate pointed, Auricles toothed, Flowers solitary, Cal sagittate
2253 Smooth, Leaves hastate lanceol or linear acute, Lobes toothed, Peduncle 1-fl Sepals oblong lanceolate
2254 Leaves sagittate truncate behind, Peduncles 2-flowered
2255 Leaves linear hastate obtuse mucronate smooth, Auricles nearly entire, Peduncles 1-flowered

§ 5 *Leaves oblong, entire, or lobed*

2256 Leaves oblong 3-pointed dilated at base toothed, Peduncle 1-fl thick 4-cornered

§ 6 *Leaves rounded*

2257 Creeping smooth, Lvs roundish emarginate or 2-lobed thickish at base beneath with 2 glands, Cal obt.
2258 Leaves emarginate with 2 glands at base, Peduncles 3-flowered

and Miscellaneous Particulars.

I. bona-nox, like most of the species of this genus and Convolvulus, varies much in the leaves, which it produces cordate, lobed, or panduriform.

I. nil is a highly beautiful plant, with the corollas of a clear blue color, whence its name of Anil or Nil (Indigo)

I quamoclit is a most beautiful tender annual. Its name has been formed from κυαμος, a bean, and κλιτος dwarf, because it resembles the kidney-bean in its climbing stem, but is less tall

I jalapa is found wild near Mexico, at Xalapa, whence probably the name of the drug which its root affords It is said to have been first brought to Europe in 1610. Its virtue as a purge resides chiefly in the resin

History, Use, Propagation, Culture,

384. *Convolvulus* From *convolvere*, to entwine This is an extensive genus of some beauty, and the C. batatas is of known utility as an edible root. The stems in the greater number of species are herbaceous and twining, a few are shrubby, and one or two very low herbs.

C. arvensis has white jointed worm-like roots, very difficult to eradicate in gardens or corn-fields: it is considered as a certain indication of a dry soil.

C. scammonia, named in Arabia *Scamunâ* (*Forsk Golius*), affords the gummy resin of that name from the roots, which are three or four feet long, from nine to twelve inches in circumference, and contain a milky juice. The top of the root being bared of earth, it is cut through in a sloping direction, and a shell or cup placed close to the section for the juice to run into. This juice hardened is the true scammony, chiefly used as a stimulating cathartic.

C. turpethum is derived from *turbid*, its name in Arabia (*Golius*)

C. batatas, (Batatas is Malay according to Rumphius, Mexican according to Nieremberg) akirrets of Peru, or Spanish potatoes, is a native of both Indies and China. It came first to Spain from the West Indies, from thence it was imported here annually, and sold as a delicacy. It is the potatoe of Shakspeare and contemporary writers, the Solanum tuberosum being then scarcely known in Europe. The batatas is cultivated in all the tro-

§ 1. *Climbing; leaves sagittate or hastate.*

2259 Leaves sagittate acute at each end, Peduncles about 1-flowered
2260 Leaves sagittate truncate behind, Peduncles rounded 3-flowered
2261 Leaves cordate sagittate behind sinuate repand, Pedunc axillary solitary about 2-flowered
2262 Leaves lanceolate hastate acute, Auricles 1-toothed behind, Stem simple, Peduncles 1-flowered

§ 2. *Climbing, leaves cordate hastate*

2263 Leaves cordate hastate hirsute, Pedunc. about 3-flowered, Bract linear remote from calyx
2264 Leaves cordate hastate angular lobed 5-nerved smoothish, Ped long, Fl fasc. Sepals lanceol. acuminate

§ 3. *Climbing; leaves cordate lobed*

2265 Leaves cordate villous at the base angular lobed, Peduncles 1-flowered, Outer sepals bract-like
2266 Pubescent, Leaves broad cordate entire or lobed fiddle-shaped, Pedunc. long, Flowers fascicled

§ 4. *Climbing, leaves quinate or palmate.*

2267 Leaves cordate sinuate silky lobes repand, Pedunc 2-flowered
2268 Leaves 7-lobed palmate hispid middle lobe sinuated drawn out, Pedunc axill. solitary very long jointed
2269 Leaves palmate pedate 5-parted, Pedunc. 1-flowered
2270 Very smooth, Leaves digitate quinate, Leaflets stalked acuminate entire, Pedunc. branched divaricating

§ 5. *Climbing, leaves cordate or subcordate.*

2271 Leaves oblong cordate acuminate subrepand smooth, Pedunc. umbelled 5-flowered, Flowers sessile
2272 Leaves cordate pubescent, Stem perennial villous, Pedunc many-flowered
2273 Leaves cordate acuminate repand, Pedunc 3-flowered, Stem mealy
2274 Leaves cordate ovate acuminate ciliated, Heads stalked very hairy with an involucrum
2275 Leaves cordate ovate acuminate entire smooth, Stem and leaf-stalks smooth
2276 Tomentose, Leaves cordate oblong obtuse subrepand, Pedunc. longer than stalk, Limb acute

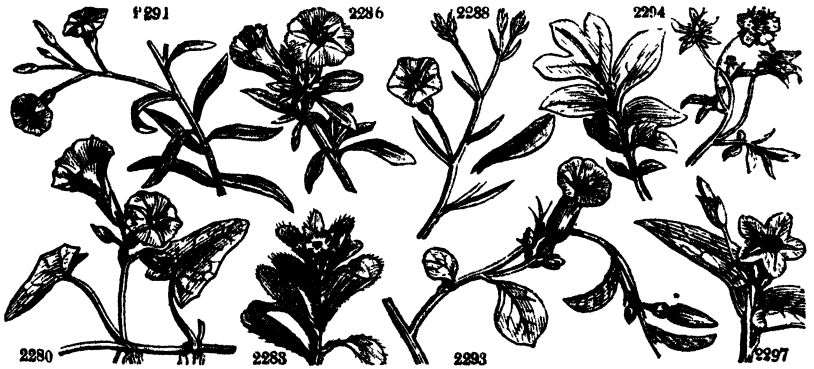
§ 6. *Prostrate, leaves cordate.*

2277 Leaves cord ovate upper acute, Ped 1-fl. shorter than leaves, Bractes obl lanc longer than ciliated cal
2278 Leaves cordate ovate cusp Ped. 2-fl. longer than leaves, Bractes lin subul shorter than parted peduncle

§ 7. *Prostrate, leaves cordate lobed or hastate*

2279 Leaves panduriform or entire emarginate cordate at base, Peduncles 1-flowered, Stem creeping
2280 Leaves hastate lanceolate, Auricles rounded, Stem creeping, Peduncles 1-flowered
2281 Leaves cordate and somewhat hastate villous, Stem and leaf-stalks hairy, Peduncles many-flowered

§ 8 *Prostrate, leaves ovate or oblong and linear*



2282 Leaves linear lanceolate, Stem ascending villous, Peduncles axillary 1-flowered 3 times as long as leaf
2283 Leaves lanceolate obtuse naked lined, Branches declinate, Flowers silky ½ 5-cleft
2284 Leaves lanceolate silky lined stalked, Peduncles 2-fl. Cal. silky leafy
2285 Very hairy, Leaves linear, Flowers capitate, Calyxes acuminate
2286 Leaves lanceolate tomentose, Flowers capitate, Calyxes hairy, Stem nearly erect
2287 Stems erect shrubby, Leaves linear acute silky, Flowers terminal umbelled panicled, Cal hairy
2288 Leaves linear lanc. acute, Stem branched nearly erect, Cal. hairy, Pedunc 2-flowered
2289 Leaves nearly linear silky, Stem panicled, Cal naked obtuse
2290 Leaves linear hairy, Peduncles about 3-flowered, Cal silky ovate acute, Branches twiggy
2291 Prostrate hoary, Leaves linear lanceolate smooth, Thyrse terminal pyramidal compound
2292 Leaves lanceolate ovate smooth, Stem declinate, Flowers solitary

2293 Leaves wedge-shaped emarginate beneath silky, Peduncles 2-flowered

2294 The only species

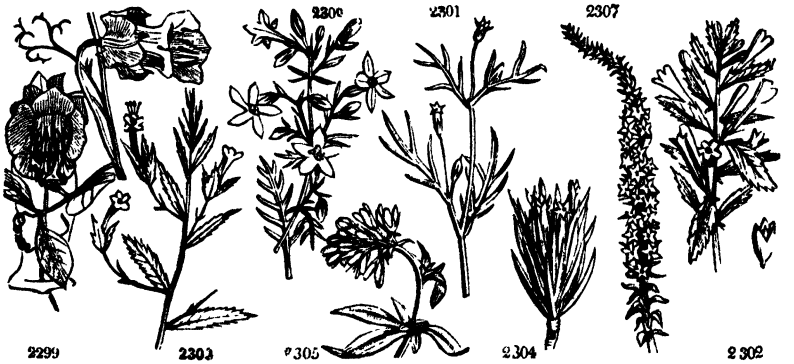
2295 Leaves sagittate very acute, behind obtuse or trunc. entire, Bract ac longer than cal twice as short as cor

2296 Leaves cordate, Lobes angular truncated, Pedunc rounded 1-fl. Bract. ovate obt. inflated, Sepals obtuse
2297 Leaves cordate pubescent, Stem erect, Peduncles 1-flowered
2298 Leaves reniform, Peduncles 1-flowered, the angles winged

and Miscellaneous Particulars.

pical climates much in the same manner as our potatoe, but with more room for its trailing stalks. Not only the tubers, but the young leaves and tender shoots are boiled and eaten; and, as is the case with all plants long in cultivation, there are several varieties.

C. tricolor is a well known border-annual, commonly called C minor, with reference to another border-flower, Ipomœa purpurea, which gardeners and seedsmen commonly call C. major.



C reptans, is a common potherb in the East Indies and in China.

385. *Argyreia.* From αργυρος, silver, in allusion to the silvery texture of the leaves of the plant. A beautiful genus nearly related to Convolvulus.

386. *Nemophila.* From νεμος, a grove, and φιλεω, to love; the species growing in shady woods. A small hardy N. American plant, with bright blue flowers and divided leaves.

387. *Calystegia.* From καλος, pretty, and στεγη, a covering, in allusion to the two bracteæ in which the calyx is inclosed. A very artificial genus, distinguished from Convolvulus and Ipomœa, only by the presence of bracteæ, and by its capsule being one-celled. C. sepium, the Convolvulus sepium of Willdenow, has medical properties similar to Scammony, for which Withering thinks it may serve as a substitute. Swine, it is said, eat the roots in large quantities, and yet are not purged by them. C. soldanella is an acrid purge.

History, Use. Propagation, Culture,

388. *Cobæa.* In honor of Barnadez Cobo, a Spanish Jesuit, who wrote upon subjects of natural history about the middle of the 17th century The name arose with Cavanilles This is the most rapid growing greenhouse climber known, having been found to grow 200 feet in length in one summer in a conservatory. It will thrive almost equally well in the open air during summer, but is destroyed by frost, and its shoots are only of annual, or at most of biennial duration It strikes in sand in moist heat, but it generally ripens seeds, which, sown early in spring, and forwarded in a stove, will flower in the greenhouse or open air the same season.

389. *Cantua* From *Cantu*, the native name of the genus among the Peruvians Pretty greenhouse plants, rarely seen in gardens

390 *Hoitzia* Hoitzit is the name of this plant in Mexico A handsome plant with brilliant scarlet flowers. It is occasionally raised from Mexican seed, but is very rare in collections

391 *Retzia* Named after John Retzius, professor of botany at Lund, in Sweden. His Observationes Botanicæ is a work of reputation A small upright shrub with whorled lanceolate leaves, and clustered brown flowers, almost hidden among the leaves

392. *Lubinia* A genus dedicated by Commerson to M de Saint Lubin, a French officer who travelled in the East Indies A small plant with ascending stem and fleshy smooth leaves, of little merit

393 *Epacris.* Named by Forster from ἐπί, upon, and ἄκρος, the top of a thing, because in New Zealand the species grow on the top of the mountains A most ornamental genus, which Sweet observes, thrives "best in a sandy peat soil, the rougher and more turfy the soil is, the better the plants will thrive · these should always be shifted in fresh pots before they are turned out of doors in spring, as their roots are so very fine, and are generally matted round the pots, so that the hot sun coming against the pots destroys them, and they look brown all through the summer, and are very difficult to recover. Young cuttings planted in pots of sand under bell-glasses in autumn or winter, or early in spring, will strike root readily, but they will not strike so readily in summer · when rooted, they should be potted singly in small pots, and set in a close frame, and must be hardened to the air by degrees." (*Bot Cult* 189.)

394. *Styphelia.* A name derived from στυφός, dense, in allusion to the compact habit of the genus. Erect

2299 The only species

2300 Lobes of leaves linear entire oblong, Flowers panicled terminal, Cor tubular twice as long as cal.
2301 Plant smaller than the last, Leaves very narrow, Cor. short blue

2302 Stem half shrubby, Leaves sessile ovate acute pubescent
2303 Stem half shrubby, Leaves subsessile linear toothed spinous

2304 Leaves in fours linear sessile erect, Flowers clustered hidden among the leaves

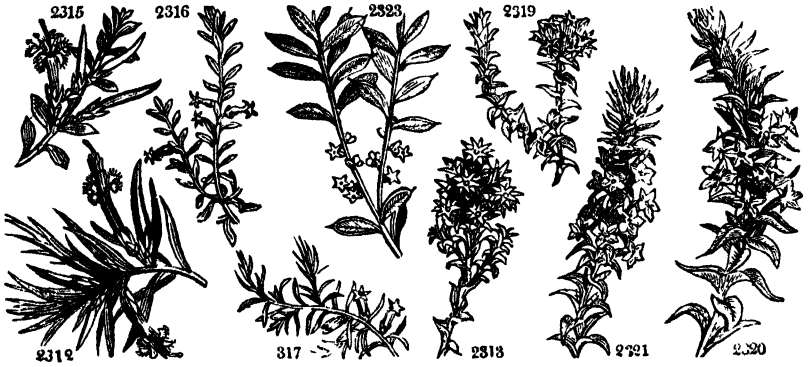
2305 Leaves fleshy dark-green glabrous obovate, Stem ascending

2306 Sepals acuminate as long as tube of cor Leaves cucullate subsess with a recurved end longer than base
2307 Sepals acum as long as tube of cor Lvs conc their base longer than spreading point, Spike flow at base
2308 Cor cylindrical 4 times as long as cal. Flowers pendulous, Leaves acuminate flat
2309 Flowers nodding, Leaves lanceolate erect imbricated with a callous obtuse end, Stamens included
2310 Leaves lanceolate acute erect above flat beneath convex, Cal. obtuse as long as tube, Stamens exserted
2311 Sepals obtuse as long as tube of cor Leaves cucullate acute spreading, Spike flowering at end

2312 Leaves long lanceolate attenuated at end, above concave smooth at edge, Branches pubescent
2313 Leaves obovate oblong obtuse mucronate flat smooth above roughish at edge, Flowers spreading
2314 Leaves oblong lanceolate flat glaucous smooth, Branches smooth, Flowers corymbose, Ped 1-3-flowered
2315 Leaves linear obovate mucronate rough above revolute at edge, Flowers nodding

2316 Leaves ellipt. lanceolate concave with a short callous point, Segm of cor smooth

2317 Prostrate much branched, Leaves lanceolate linear convex above ciliated at edge



2318 Anthers connate bearded, Cal. colored, Leaves long acuminate

2319 Leaves spreading with a flat point

2320 Cor. monopetalous, Tube entire as long as cal. Leaves ovate acuminate spreading

2321 Leaves sessile cordate acuminate pungent recurved, Cal. imbric as long as narrow tube of cor

2322 Spikes erect subterminal aggregate or axillary solitary, Leaves ellipt oblong 4 times broader than long
2323 Spikes axillary few-flowered nodding stalked, Leaves oblong acute flat mucronate

and Miscellaneous Particulars

branched shrubs, natives of New Holland, with scattered mucronate leaves, and axillary, nodding, very showy flowers. Culture as for Andersonia.

395. *Lissanthe* A New Holland genus of shrubs with small white flowers, the segments of which are smooth, not bearded as in Leucopogon, to which the genus is next. From this difference its name has been contrived; λισσος, smooth, and ανθος, a flower.

396. *Astroloma.* From αστηρ, a star, and λῶμα, a fringe, in allusion to the stellate disposition of the little bundles of hairs at the bottom of the tube A genus of neat little bushes, with axillary erect flowers Culture as for Andersonia.

397. *Sprengelia* So called in honor of Curt Sprengel, professor at Halle, in Saxony, a learned man and respectable botanist. His Historia Rei Herbariæ is a monument of industry and information. This is a handsome half-hardy genus, delighting in a shady aspect, sandy peat soil, and dry bottom. They must be watered sparingly when not growing freely Cuttings root in sand under a bell-glass

398 *Andersonia* Named by Mr Browne, first, after William Anderson, a navy surgeon, who died in Cook's last voyage, secondly, after Dr Anderson, formerly director of the botanical garden, St Vincents, and lastly, after William Anderson, the curator of the apothecaries' garden, Chelsea. According to Sweet, this genus "grows freely in a sandy peat soil with the pots well drained, and care should be taken not to over-water it, as they are very liable to get sodden, when they seldom recover The very young tops put in for cuttings, under a bell-glass in sand, will root readily When first potted off, they should be put singly in small thumb-pots, and kept close in a frame for a few days, and hardened to the air by degrees" (*Bot Cult* 1 53.)

399. *Lysinema* Perhaps derived from λυσις, a separation or solution, and νημα, a stamen, but the application of the name is not obvious Shrubs with the habit of Epacris. They prefer rough turfy soil, and cuttings root readily in sand under a bell-glass

400. *Monotoca* From μονος, one, and τοκος, birth, because only one ovulum is borne by the ovarium, a remarkable circumstance in the natural order of the genus. The species are little shrubs, with axillary or terminal spikes of white flowers They require well drained pots, and their cuttings must be taken off when very young, and planted in sand under a bell-glass.

History, Use, Propagation, Culture,

401 *Leucopogon* From λευκος, white, and πωγων, a beard, because the segments of the white flowers are bearded A very extensive genus of small shrubs, with spiked axillary or terminal flowers. Culture as for Andersonia

402 *Stenanthera* From στενος, narrow, and ανθηρα, an anther, the anther being in this genus not so broad as its filament. A bush with pine-like leaves, and erect large scarlet blossoms. Culture as in Andersonia.

403. *Azalea.* From αζαλεος, dry, arid, either in allusion to the places where the plant grows, or to the brittle dry nature of its wood. This is a very ornamental genus, from its abundance of flowers of almost all colors, and the fragrant smell of most of the species A indica is the most delicate, but flowers well in a moist heat in rough peat well drained According to Sweet, "it thrives best in a sandy peat, and the pots to be well drained with small pieces of potsherd it should be set in an airy part of the greenhouse in winter, and great care must be taken not to over-water it In summer it should be exposed to the open air, but not in a very sunny situation Young cuttings taken off close to the plant, and planted in pots of sand, will root readily, if plunged in heat under a bell-glass." (*Bot. Cult* 144) T Blake keeps his plants "in peat and leaf-mould, always in the greenhouse till they are in a flowering state, and then he removes them to the hothouse, the sudden heat causing the blossom to open the better" (*Hort Trans* iv 133) J. Nairn uses the most fibrous part of peat-earth and sand; he places them in a considerable heat, and always in the shade, and when the plants exhibit blossom buds in March, he then raises the temperature from 50° to 60°. This species strikes by cuttings of the young wood, taken off close to that which is ripened, planted in pots of sand, and plunged under a bell-glass.

The hardy Azaleas are best grown in compartments or groups by themselves, or with other American or European plants requiring a moist peat soil, and rather shady situation. Where peat is not to be had, the

2324 Spikes nodding aggregate, Ovaries 2-celled, Drupes oval, Leaves lanceolate flat 3-nerved
2325 Spikes axillary close together 3-4-flowered, Leaves obl lin. moderately spreading mucronate
2326 Spikes axillary and terminal spreading stalked longer than the leaves, Leaves cordate stem clasping
2327 Flowers subsessile solitary or 2 together, Leaves divaricating lanceolate linear bristly pointed

2328 The only species Leaves like those of a fir very close together

2329 Flowers nearly solitary, Calyx hairy

2330 Leaves oblong narrowed at the end shining ciliated smooth, Corymb terminal, Tube of cor glandular

2331 Nearly naked flowered, Leaves oblong pubescent on both sides, Flowers large not viscid, Cal. teeth obl

2332 Leaves beneath thinly downy nerve not bristly, Flowers rose-colored not viscid, Cal very minute
2333 Leaves oblong narrowed at the base ciliated smooth, Corymb terminal, Cor hairy outside, Stam. exsert.

2334 Naked flowered, Leaves oblong slightly pubescent on both sides, Flowers small not viscid, One segment of corolla linear 4 times as long as the others
2335 Branches hispid, Leaves same color on both sides with the nerve hispid, Cal teeth very short round

2336 Branches smooth, Leaves small oblanceolate mucronate coriaceous with a hispid nerve, Flowers viscid
2337 Branches hispid, Leaves acute smooth on both sides glauc beneath with a hispid nerve, Fl. very viscid
2338 Branches upright very hispid, Leaves long lanceolate hispid above, Flowers very viscid

2339 The only species

2340 Leaves long narrow entire with a brown edge

2341 The only species

and Miscellaneous Particulars

next best soil is a soft black sandy loam with leaf-mould, or mould from any decayed vegetable matter unmixed with animal remains, as the mould of decayed thatch, or the sweepings of stack-yards, wood-piles, &c Seeds are obtained from many of the sorts, and should be sown in pans or shallow wide pots thinly covered, placed in a shady situation, and kept moderately moist When fit to transplant, they should be pricked into other pots, and placed under a glass, and shaded till they have struck roots afresh They may then be hardened by degrees, and, when their roots fill the pots, planted out in beds, or where they are finally to remain. Most of the hardy Azaleas are well adapted for growing in pots, and for forcing early in spring The deciduous sorts flower better than those which are subevergreens.

By intercrossing with Azalea and Rhododendron, some new and curious varieties or hybrid species have been produced, especially in Colvill's nursery, under the direction of Mr Sweet · and from some thousands of seedlings which have not yet flowered, many more are expected. (See *Encyc. of Gard.* part II. b. i. ch viii. sect. 7. The juice in the bottom of the flower of A pontica is poisonous, and communicates its bad properties to the unwholesome honey of Pontus Several fine varieties of the Azalea indica have lately been brought to this country; but many of the best varieties are still among the desiderata of English cultivators.

404. *Chamædedon.* From χαμαι, dwarf, and λιδον, a kind of cistus This has been formed from the well known Azalea procumbens of Linnæus, one of the most interesting of our northern plants.

405. *Brexia.* So named by Noronha, perhaps from βρεξις, rain, in allusion to the protection afforded by the fine large leaves of the genus against rain. Fine stove plants with firm, spiny, or entire leaves, and axillary green flowers In the garden they are commonly called Theophrastas.

406 *Ophiorhiza.* From οφις, a snake, and ριζα, a root, from the use which is made of the roots in the East Indies for curing the bites of dangerous snakes. Mungos is an Indian name. A pretty stove plant, whose white flowers are well relieved by the dark red back ground of the calyxes and pedicels.

History, Use, Propagation, Culture,

407 *Allamanda* In memory of Dr Frederick Allamand, a professor of natural history in the university of Leyden, who went to Guiana about 1769, and to Russia about 1776, and sent descriptions, figures, and specimens of plants to Linnæus It is a milky shrub, of cathartic qualities, flowers freely, and strikes with ease in a moist heat

408. *Theophrasta* Theophrastus was born at Eresus in Lesbos, 310 years before Christ, and died at the age of 83 Linnæus has justly termed him the prince of botanists The genus which has been selected to commemorate his name, is a curious prickly-leaved, low plant, native of St Domingo, where it is called by the negroes wild cocoa. In the collections of this country it is rare, and no means has yet been discovered of propagating it, except by seeds

409. *Clavija* Named in honor of Joseph Clavijo Faxardo, a Spanish naturalist, who translated into his own language the works of Buffon. A fine genus of plants, exceedingly rare both in gardens and herbaria.

410 *Vmca.* From *vincuum*, a bond, in allusion to its twining shoots The origin of its English name is, however, quite unknown The Anglo-Saxons called it *perunce*; the English, *periwinkle*; the French, *pervenche* This is a genus of well-known little shrubs, valued for their early and long continued flowering, and the hardy species as being evergreens which thrive under the shade and drip of trees V minor and major, like other plants which run much at the root, very rarely produce seeds. V rosea is continually in flower, and is easily propagated by cuttings under a hand-glass.

411. *Nerium* From *νερος*, damp, the plant growing upon the borders of rivulets, in the southern parts of Europe. This is a genus of beautiful evergreen shrubs of easy culture and propagation, and free flowerers great part of the year N tinctorium affords a blue equal to that of indigo, and it is thought by Dr. Roxburgh might be cultivated for that purpose.

N. oleander is very common in the Levant, and especially in the Isle of Candia, and in Sicily, Magna Græcia,

2342 The only species Leaves 4 together subsessile ovate oblong, Flowers in villous fascicles

2343 A small prickly-leaved bush without branches and with terminal clusters

2344 Leaves very long lanceolate retuse toothed spinous

2345 Stems herbaceous prostrate, Leaves oblong lanceolate smooth, Flowers stalked, Cal ciliated
2346 Stems procumbent, Leaves ellipt lanc. smooth at edge, Flowers stalked, Teeth of cal lanceolate

2347 Stems nearly erect, Leaves ovate ciliated, Flowers stalked, Teeth of calyx setaceous elongated

2348 Stem herbaceous erect square, Leaves lanceolate, Flowers twin or solitary stalked
2349 Stem erect, Flowers twin sessile, Leaves ovate oblong, Stalks 2-toothed at the base

2350 Leaves lin lanc 3 together ribbed beneath, Sepals squarrose, Nect. flat 3-toothed

2351 Leaves linear lanc. 3 together, Corona filamentose, Anthers at end feathery

2352 Leaves ovate oblong shortly acuminate smooth, Corymbs terminal, Tube of cor 6 times as long as calyx
2353 Leaves obl lanceol subacuminate smooth, Corymbs terminal, Tube of cor 4 or 5 times as long as calyx
2354 Leaves ellipt lanc and ovate acum. smooth, Branches and corymbs divar Tube of cor twice as long as cal

2355 Stems sarmentose, Leaves oblong, Pedunc 2-flowered
2356 Pedunc many-flowered, Cor cylindrical hairy outside, Leaves ovate mucronate pubescent beneath
2357 Pedunc racemose, Leaves lanceolate acuminate, Follicles torulose very long
2358 Pedunc umbelled, Leaves ovate obtuse mucronate
2359 Leaves oval lanceolate acute at base the lowest linear, Flowers in fascicled corymbs
2360 Prickles two extra-foliaceous, Leaves lanceolate smooth, Flowers terminal in threes
2361 Panicle terminal, Cal spreading as long as corolla, Leaves ovate mucronate
2362 Stem erect rounded, Leaves oval acuminate smooth, Flowers terminal in threes
2363 Stem erect angular, Leaves ovate lanceolate obsoletely crenate, Corymbs axillary dichotomous
2364 Leaves ovate lanceolate entire strongly marked with crimson veins

2365 Stem erect shrubby, Leaves lanceolate oval, Cor acute, Throat villous

and Miscellaneous Particulars.

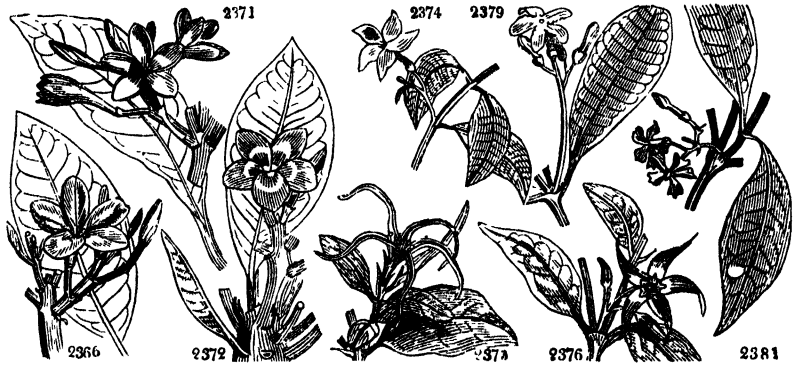
&c by rivers and torrents. the leaves are acrid and poisonous. Young cuttings planted under a hand-glass, and placed on a little heat, root freely.

N. odorum and its varieties, though treated as a greenhouse plant, requires a stove to make it flower freely

412. *Wrightia.* Named after Dr William Wright, a Scotch physician, who resided some years in the West Indies at the end of the last century, and the author of one or two botanical tracts W. antidysenterica is reputed to be a specific in the dysentery The wood is well adapted for the turner, and to make cabinets and other elegant furniture. It is very white, and of a fine grain like ivory, only much lighter It mixes admirably with ebony

W zeylanica is an elegant branched shrub, with whitish yellow flowers and an agreeable odor Both species may be treated like Nerium.

413. *Echites.* A name employed by Pliny as the designation of a kind of Clematis, it is derived from ἔχις, a viper, on account of the twisting nature of its shoots This is a genus of plants somewhat angular in habit, with opposite, veined, shining leaves, and flowers in peduncles void of scent. They all flower freely, and root readily under a hand-glass in sand



E. biflora supports itself partly by stems, and partly by twining on trees, hence frequently acquiring the air of a tree. It grows in salt marshes

E suberecta climbs. when it grows in savannahs it does not rise above three feet, and sometimes not more than one foot high

E. sanguinolenta is remarkable for the beauty of its foliage, the veins of which are stained with crimson

414. *Ichnocarpus.* From *ichnos*, a vestige, and *carpos*, fruit Climbing shrubs of Sierra Leone and the East Indies, with long branches covered with smooth entire leaves, and white sweet-scented flowers Cuttings root freely in sand under a hand glass

History, Use, Propagation, Culture

415 *Plumieria* So named by Tournefort, in honor of Charles Plumier of Marseilles, a Franciscan friar, who travelled into South America He is distinguished for the accuracy of his observations, and for the fidelity of his drawings, which are the only representations of many of the most curious plants of the West Indies and South America His drawings of flowers have seldom, even in these days of pictorial excellence, been equalled He was the author of Plantæ Americanæ, 1693, and other excellent works This is a fine flowering genus. "It succeeds best in a light loamy soil, and requires but little water Large cuttings taken off and laid to dry for a considerable time, may be stuck in the tan in a moderate heat, or planted in pots, and they will root freely; they must not be covered with a glass, or it will rot them To have the plants flower well, they should be kept very dry when not in a growing state, which will throw them into bloom." (*Bot Cult* 95)

416 *Strophanthus* From στρεφω, to turn or twist, and ανθος, a flower; in allusion to the manner in which the segments of the corolla are twisted together before expansion. A most beautiful genus of tropical shrubs, with bright yellow flowers more or less spotted with red They require the same treatment as Echites.

417. *Camerária.* So named by Plumier, from Joachim Camerarius, a physician and botanist of Nuremberg, who was born in 1534, and died in 1598 He published an edition of Matthiolus, in Latin and German, with new figures, and many observations, but the most celebrated man of the name was Ralph James Camerarius, a German botanist, who published in 1719, a tract, in which the first principles of the arrangement of plants by their seeds were propounded This is a fine flowering genus, of easy culture, and cuttings root freely under a hand-glass in a pot of sand

418 *Tabernæmontana* So named by Plumier, in memory of James Theodore, surnamed Tabernæmontanus, from Berg-Zabern, the place where he was born He published "Krauterbuch," and figures of plants in 1589-90, was physician to the Elector Palatine, and died in 1590 This is a genus of easy culture but little beauty. All the species root in sand under a hand glass

419. *Amsonia* So named by Clayton in his Flora Virginiana, referred to Tabernæmontana by Linnæus, now separated again These are pretty plants, which grow in any soil; and may be propagated by cuttings under a hand-glass, or dividing at the root.

420. *Cerbera.* A poetical name formed in allusion to the mythological dog Cerberus, whose bite was poisonous, as is the juice of this genus. Ahoual and Manghas are vernacular names of the countries where the spe-

2366 Leaves ovate oblong flat, Leaf stalks with two glands
2367 Leaves scattered lanceolate acute, Flowers corymbose terminal
2368 Leaves lanceolate revolute, Peduncles tuberous above
2369 Leaves lanceolate stalked obtuse
2370 Flowers always with the limb closed very sweet-scented
2371 Leaves oblong acuminate flat at edge, Cor white and yellow
2372 Leaves oblong acute, margins flat veiny, Cor. tube red, throat yellow, limb white

2373 Branches dichotomous, Leaves mucronate-acuminate, Cor. infundibuliform

2374 Leaves rounded ovate acuminate at the base transversely striated, Flowers terminal corymbose
2375 Leaves ovate oblong netted, Umbel stalked few-flowered, Flowers large yellow sweet (*C. lutea.*)
2376 Leaves ovate lanceolate wavy, Corona 10-cleft: alternate segm. shorter obtuse
2377 Leaves linear

2378 Leaves ovate, Flowers lateral in clustered umbels
2379 Leaves ovate, Peduncles few-flowered, Stamens included
2380 Leaves lanceolate ovate, Branches divaricating
2381 Leaves oval lanceolate, Stamens longer than tube of corolla

2382 Stem smoothish, Leaves oval lanceolate the upper acuminate beneath a little hairy
2383 Stem smooth, Leaves linear lanceolate acute at each end quite smooth
2384 Leaves narrow lanceolate close erect pubescent, Stem obviously pubescent

2385 Leaves ovate acute
2386 Leaves lanceolate, Nerves transverse
2387 Leaves lanceolate attenuate at each end veiny spotted, Cymes axillary branched
2388 Leaves ovate scattered subsessile, Flowers terminal about 5
2389 Leaves linear very long, Flowers subsolitary axillary, Fruit roundish
2390 Dichotomous, Leaves broad lanceolate, Corymbs terminal, Drupes obliquely cup-shaped gaping

2391 Leaves obovate scabrous very large whitish beneath

2392 The only species A pretty stove annual

2393 Prickly, Leaves lanceolate obtuse acute at base attenuate smooth
2394 Leaves obovate lanceolate beneath silky, Peduncles axillary clustered

and Miscellaneous Particulars.

cies so called are found. Thevetia is named after Andrew Thevet, a French monk, who travelled in Brasil about 1530 C Ahouai has thick succulent leaves about three inches long, and near two broad, of a lucid green, smooth, and very full of a milky juice, as is every part of the shrub The flowers are in loose bunches at the ends of the branches, and are succeeded by nuts, the kernels of which are a most deadly poison. The wood stinks abominably, and is not used even by the Indians for fuel. They put small stones into the empty nuts, string them, and fasten them about their legs when they dance.

C Manghas is a milky tree with broad lanceolate leaves a foot in length, flowers in terminal racemes, and the drupe ovate, the size of a goose's egg, inclosing two seeds resembling two large chestnuts, poisonous and emetic

C. Thevetia is an elegant shrub or small tree, with acuminate leaves, and large, specious, nodding, yellow, sweet-smelling flowers The fruit is a green drupe, containing a nut with a single kernel in it. Cuttings of all the species strike very readily in sand under a hand-glass.

421 *Tectona.* Altered by Linnæus from *Tekka*, its name in Malabar. This is a timber-tree of immense size and great durability, and is justly called the oak of the east. The trunk is erect, and the bark ash-colored, the leaves are obovate, downy underneath, and on young trees from 12 to 24 inches long, and from 8 to 16 broad. The flowers are in panicles, small, white, and fragrant. The seeds are lens-shaped in 4-celled drupes The tree abounds in the vast forests of Java and Ceylon, Malabar, Coromandel, &c, and especially in the empires of Birman and Pegu The wood has, by long experience, been found to be the most useful in Asia. It is easily worked, and at the same time both strong and durable It is considered superior to all others for ship-building. Calcutta and Madras draw all their supplies of wood for ship-building from the teak forests of Ava and Pegu Some of the finest vessels that have ever arrived in the Thames have been of teak tree, built in Bengal. The tree was introduced to the British possessions by Lord Cornwallis, and is now planted with a view to timber in the mountainous parts of Bengal. In our stoves it thrives in loam and peat, and ripened cuttings root freely in sand under a hand-glass

422 *Caldasia* A pretty stove herbaceous plant, with handsome small blue flowers. It was named by Willdenow, after the MSS. of Baron Humboldt, in honor of Joseph Caldas, a meritorious Spanish botanist, residing at Popayan in South America. It may be propagated by cuttings.

423. *Bumelia.* A name given by the Greeks to our common ash. Swartz applied the name to this West Indian

History, Use, Propagation, Culture,

genus These are plants with good foliage, but no beauty of blossom Some of the species are robust enough to bear our winters in the open air, but they are rather tender, and require to be placed in a sheltered situation or against a warm wall, and covered with mats during winter Cuttings root in sand under a hand-glass The stove species are low West Indian trees, and known there under the name of Bully tree They thrive well in loamy soil, or loam and peat, and cuttings will root, but, according to Sweet, "not freely, in sand under a hand-glass," being well ripened before they are taken off.

424 *Chrysophyllum* From χρυσος, gold, and φυλλον, a leaf, all the species having their leaves covered on the under surface with dense shining hairs of a bright yellow or white color C cainito has large elegant leaves, ferruginous underneath, it forms a tree of considerable size, with slender flexible branches The leaves and fruit, like the Achras, to which the tree is very nearly allied, are full of milk, which the fruit retains even in the most perfect state This milk is rough and astringent before the fruit ripens, but when it grows to full perfection, it becomes sweet and gelatinous, with an agreeable clamminess Being mixed with a small quantity of orange juice, it binds the body extremely The tree is of general and easy culture in Jamaica, and is here grown chiefly for its foliage Sweet says, ripened shoots of all the species taken off and planted in sand, will root under a hand-glass with a strong moist heat

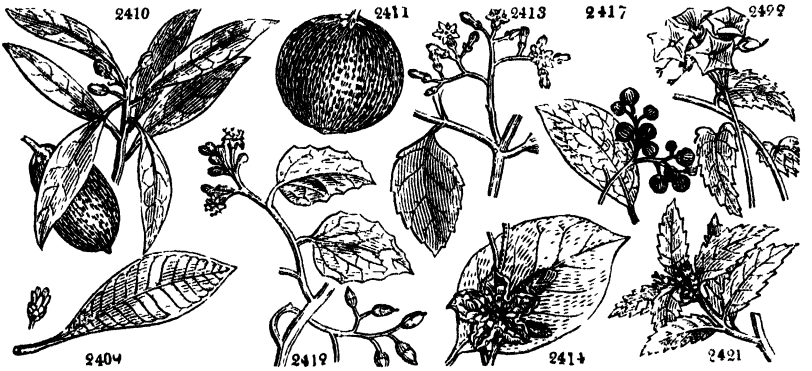
425 *Siderozylon* From σιδηρος, iron, and ξυλον, wood, in allusion to the hardness of the wood. The specific name melanophleum (μελας φλοιος) means black-bark The wood of this tree is very close and hard, and so heavy as to sink in water It grows well in loam and peat, and cuttings somewhat ripened may be struck in sand under a hand-glass

426. *Jacquinia* So named by Linnæus, in honor of James Nic. Jos de Jacquin, professor of botany at Vienna, born at Leyden, in 1727, author of many splendid works A noble genus, well devoted to perpetuating the memory of one of the first of botanists The name of one of the species armillaris, (from *armilla*, a garland,) has been applied in consequence of the shoots being used by women in America as garlands. This beautiful genus requires some care in propagation, but is of easy culture in the bark-stove, in loam and peat, and with a moist heat. "Cuttings," Sweet observes, "will strike root with ease in sand, under a hand-glass, in heat."

427. *Achras* The Greek name of the wild pear The root of the word has been thought to have been found in *ac*, the Celtic for a point, in allusion to the many stout spines with which the tree is covered. The word Sapota, applied to one of the species, is derived from its Mexican name Cochit-zapotl This is a genus of fruit-bearing timber-trees, chiefly natives of the West Indies A mammosa, or American marmalade, grows in America to the height of 35 or 40 feet, having a straight trunk covered with an ash-colored bark The branches form a regular head, the leaves a foot in length, and near three inches broad in the middle The flowers are

2395 Leaves lanceolate ovate acuminate, Peduncles clustered axillary and lateral
2396 Leaves terminal oblong lanceolate smooth wavy at edge, Branches lax
2397 Spiny, Branches spreading pubescent, Leaves oval lanceolate smooth above beneath woolly
2398 Spiny bushy loosely reclinate, Sterile branches divaricate divided, Leaves small obovate smooth
2399 Unarmed, Leaves evergreen oblong lanceolate acute at each end prickly serrate, Berries large
2400 Leaves rounded edged veiny coriaceous smooth on both sides

2401 Leaves ovate with parallel veins beneath tomentose shining
2402 Leaves falcate ovate beneath downy shining
2403 Leaves oblong acuminate beneath downy gold color, Fruit ovate 1-seeded
2404 Leaves ovate oblong smooth on both sides, Fruit elliptical smooth



2405 Leaves oblong ovate obtuse, Flowers lateral and axillary

2406 Leaves wedge-shaped, Branches at the ramifications nodose whorled
2407 Leaves obovate lanceolate acuminate pungent
2408 Leaves lanceolate acuminate

2409 Flowers solitary, Leaves cuneiform lanceolate
2410 Flowers solitary, Leaves lanceolate ovate
2411 Brachiate diffuse, Fruit rounded with the mucro of the hilum shorter

2412 Leaves ovate smooth above, Corymbs lateral, Calyxes 10-striated
2413 Leaves roundish ovate toothed veiny scabrous, Corymbs axillary monœcious
2414 Leaves ovate subcrenate subrepand rough, Cal cylindrical shorter than the tube
2415 Leaves lanceolate ovate rough, Panicle terminal, Cal tomentose 10-striated
2416 Leaves ovate villous a foot and half long
2417 Leaves oblong ovate entire, Flowers corymbose, Cal. downy inside
2418 Leaves in 3s ovate oblong acuminate, Branches nodose hispid, Cal bearded
2419 Leaves oblong attenuated at the end entire coriaceous, Racemes comp diffuse
2420 Leaves oblong lanceolate smooth on each side the upper serrate, Branches pilose

2421 Leaves lanceolate linear acuminate hoary beneath, Pedunc lateral axillary naked
2422 Leaves ovate on long stalks, Stalk above the base bent inwards and jointed, Cor hypocrateriform

and Miscellaneous Particulars

cream-colored, and are succeeded by large oval or top-shaped fruit, covered with a brownish skin, under which is a thick pulp of a russet-color, very luscious, called natural marmalade, from its likeness to marmalade of quinces It is commonly planted in gardens for the fruit in Jamaica, Barbadoes, Cuba, and most of the West India islands In this country it has been hitherto grown only as a part of botanic collections, but some attempts have been lately made to cultivate it as a stove fruit, and we have no doubt they will be attended with success "Cuttings root readily in a pot of sand plunged in heat, under a common hand-glass The cuttings should be taken off as near the stem of the plant as possible, not being so apt to rot as when cut off in the middle of the shoot. No leaves should be taken off or shortened above the sand" (*Sweet*)

A sapota is a large, tall, straight tree, without knots or branches, for twenty feet or more The head spreads into many small branches, the bark is dark-grey and full of cracks, the fruit is bigger than a quince, round, and covered with a thick grey rind, yellow when ripe The flesh is as yellow as a carrot, with two stones the size of almonds, of a rich smell and taste The variety called the Naseberry has fruit as big as a bergamot pear, and similarly shaped When it is green or first gathered, the juice is white and clammy, and will stick like glue, then the fruit is hard, but when it has been gathered two or three days, it grows soft and juicy, and then the juice is clear as spring-water and very sweet, in the midst of the fruit are two or three black stones or seeds, about the bigness of a pompion seed. It is esteemed an excellent fruit in the West Indies. In our stoves it is propagated like the mammee tree.

428 *Cordia*. So named by Plumier after E. Cordus, a German botanist of the 16th century Valerius Cordus, his son, was born in 1515, and died in 1544. He left a History of Plants, and was the author of some Observations upon Dioscorides. Sebestena, the name of a species, is *sebestân* in Persian Myxa is derived from μυξα, a viscidity, on account of its viscid mucous juice, which is used for glue in the east. Geraschanthus, from γεραινω, to grow old, and ανθος, a flower, is in allusion to the long duration of the flowers, collococca, (κολλα, glue, and κοκκος, glutinous fruit) in allusion to the fruit This is not a delicate genus, but flowers freely The timber of C myxa is tough and solid, and used in the east for procuring fire by friction The leaves bruised with those of Datura metel are applied to the forehead in the headach, children eat the fruit, from which also a glue is prepared. C sebestena is very ornamental, on account of its large, tubular, scarlet flowers, the most beautiful and agreeable, says Browne, of any I have seen in America A small piece of the wood put on a pan of lighted coals, will perfume a whole house From the juice of the leaves, with that of a species of fig, is prepared the fine red color with which they dye their clothes in Otaheite. Poultry in the West Indies feed on the berries of C collococca, which is there called the clammy cherry, or Turkey berry-tree All the species grow readily in loam and peat, and cuttings strike in sand, under a glass, in heat.

429. *Varronia*. Named after Marcus Terentius Varro, a most learned Roman, born 116 years before Christ,

History, Use, Propagation, Culture,

and lived a hundred years The work he left upon the agriculture of his time is invaluable. In French a species is called *Monjoli*, (my beauty) on account of its beauty

430 *Ehretia* So named by Linnæus in honor of D G Ehret, a famous French botanist and draughtsman He made all the drawings for Patrick Browne's History of Jamaica, and a large collection of his drawings is now extant in the Banksian collection Large trees of the Tropics, with handsome foliage and white flowers, which are not often produced in Europe

431 *Bourreria* A genus divided from Ehretia, with which it nearly agrees It was named after one Bourer, an apothecary at Nuremberg

432 *Ellisia* Joseph Ellis was an English naturalist, fellow of the London Royal Society, and correspondent of Linnæus He published, besides his Natural History of Corallines, many papers in the Transactions of the Royal Society

433 *Sersalisia* Named after John Baptiste Sersalis, a Neapolitan clergyman, much praised by Fabius Columna Culture the same as for Sideroxylon

434 *Manglilla* This genus is called in Dombry's Manuscript Papers, from which M. de Jussieu obtained his knowledge of it, Manglille de Perou The original species was a Peruvian shrub, with alternate leaves and bunches of numerous axillary flowers

435 *Ardisia* A name derived from ἀεδὶς, a point, on account of the acute segments of the corolla. An ornamental genus of plants, much valued by collectors for the beauty of their foliage, flowers, and berries. They are of easy culture cuttings strike root freely in a pot of sand, plunged in a moist heat, under a hand-glass

436 *Arduina.* In honor of Pietro Arduini, curator of the economical garden of Padua. A genus scarcely distinct from Carissa. It is a pretty little plant not unlike the box, easily propagated by cuttings under a bell-glass in sand.

437 *Strychnos.* A name given by the Greeks to the Solanum The root of the name has been found in the verb στρωω, to strew, to throw down, the property of the original and modern plants being narcotic S. nux-vomica is a middling sized tree with a crooked trunk and smooth ash-colored bark the leaves round, shining, smooth,

2423 Leaves broad ovate serrate rugose, Spikes terminal, Flowers clustered, Cal large inflated
2424 Leaves linear toothed obtuse revolute at edge rough above tomentose beneath, Spikes linear oblong

2425 Leaves oblong ovate entire smooth, Flowers panicled
2426 Leaves ovate roughish, Flowers corymbose spiked 1-sided

2427 Leaves ovate entire smooth, Flowers corymbose, Cal. smooth
2428 Leaves ovate very smooth reflexed at edge, Berry juiceless 4-cornered

2429 The only species, resembling a Hydrophyllum

2430 Leaves ovate obtuse downy beneath, Cor. villous outside, Barren filaments lanceolate

2431 Leaves oblong acute at each end, Flowers solitary lateral

2432 Panicles axillary and terminal, Leaves oblong acuminate narrowed at base
2432 Corymbs axillary 3-parted, Leaves oblong narrowed towards each end
2434 Panicles terminal, Leaves lanceolate ovate repand crenate acuminate attenuated at base
2435 Racemes lateral axillary compound, Leaves oblong acuminate entire
2436 Corymbs axillary simple, Leaves entire ovate elliptical coriaceous
2437 Leaves oblong entire coriaceous shining, Pan terminal, Sepals rounded, Cor thrice as long as cal
2438 Leaves oblong entire coriaceous shining, Pan terminal, Sepals round, Cor twice as long as calyx
2439 Racemes axillary simple, Leaves obovate at the edge cartilaginous serrated
2440 Leaves wedge-shaped oblong nearly sessile entire smooth reflexed, Panicles decompound
2441 Raceme terminal pyramidal, Pedunc altern umbelliferous, Leaves oblong obtuse smooth entire
2442 Leaves lanc crenate, Corymbs compound, Flowers spotted
2443 Leaves lanceolate coriaceous sinuate narrowed towards the base, Cor campan dotted. Lobes obtuse
2444 Flowers panicled, Leaves oblong entire veinless coriaceous

2445 Leaves cordate ovate mucronate subsessile, Spines bifid at end

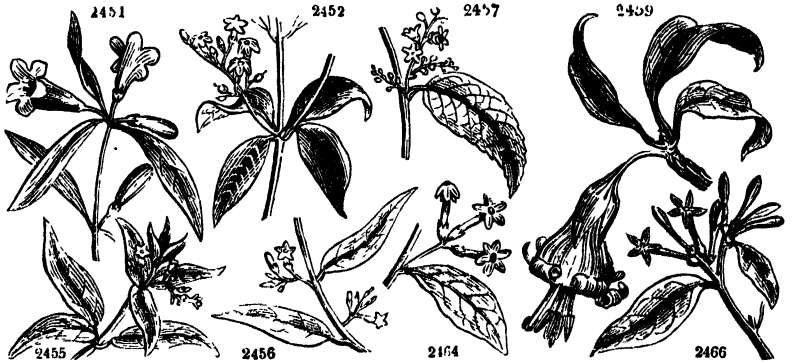
2446 Unarmed, Leaves ovate stalked, Cymes subterminal
2447 Leaves opp ovate acute 5-nerved veiny, Cymes axillary

2448 Leaves ovate mucronate netted veiny, Segm of cor lanceolate
2449 Leaves ovate acute veiny, Segments of cor oblong

2450 Leaves cordate lanceolate, panicles short opp few-flowered, Bractes very small

and Miscellaneous Particulars.

entire; and the berry the size of a pretty large apple The wood is hard, durable, and very bitter. The seeds, which form the officinal nux-vomica, are employed in the distillation of country spirits, to render them more intoxicating The pulp of the fruit seems perfectly innocent, being eaten greedily by many sorts of birds The seed consists chiefly of a gummy matter with a little resin, the latter intensely bitter. It is reckoned amongst the most powerful poisons of the narcotic kind. It proves fatal to dogs in a very short time, and to most other quadruped vermin, and even some birds, as crows and ducks From dissections both of the human subject and of dogs that have been poisoned by it, no injury appears done to the stomach or intestines, which proves that it acts upon the nervous system, and destroys life by the virulence of its narcotic influence



S. potatorum is a larger tree than the other The pulp of the fruit when ripe is eaten by the natives: the ripe seeds are dried and sold in every market of the East Indies to clear muddy water. A precious quality in countries where the water is rarely of a good quality Hence the English name of clearing-nuts. The natives never drink clear well-water, if they can get pond or river water, which is always more or less impure. One of the seeds is rubbed very hard for a minute or two round the inside of the vessel containing the water, which is generally an unglazed earthen one, and the water left to settle, in a very short time the impurities fall to the bottom, leaving the water clear, and perfectly wholesome These nuts are constantly carried about by the more provident part of our officers and soldiers in time of war, to enable them to purify their water, they are easier to be had than alum, and are probably less hurtful to the constitution

438 *Carissa* A word of no known meaning. Carandas is a slight alteration of Caraunda, the Bengalese name of the tree. C. Carandas is a small tree, with dichotomous branches, and entire, glossy, ovate leaves, flowers like those of Jasminum grandiflorum, and berries black when ripe, eatable, and of a sweet acid flavor. Currant-jelly is made of them in the East Indies.

C spinarum is a dioecous plant with horizontal branches, coriaceous glossy leaves, and terminal peduncles of five or six small flowers Neither of the species require much water, and the pots should be well drained to prevent their getting sodden Cuttings strike root freely under a bell-glass in sand plunged in heat.

439 *Pæderia.* From *pædor*, stink, in allusion to the fœtid smell of the flowers. A climbing smooth shrub, with opposite stalked entire leaves, and dull purple flowers.

History, Use, Propagation, Culture,

440 *Gelsemium* One of the ancient names of the jasmine A beautiful climbing evergreen shrub, rather too delicate to bear the cold of our winters, but with a little protection it produces in abundance its charming yellow flowers of delicious fragrance

441 *Rauwolfia* So named by Plumier, in honor of Leonhard Rauwolf, physican at Augsburg, who travelled through Palestine and other countries of the east, in 1755.5 His travels were translated into English, under the revision of Mr Ray, and with additions by him The species abound in a milky juice, which is considered more or less of a deleterious nature They produce berries about the size and color of those of the privet. Cuttings root in sand under a hand-glass

442 *Vallesia* In honor of Fr Vallesio, principal physician to Philip II, king of Spain. He wrote upon the plants of holy writ. Small Peruvian shrubs

443 *Bœobotrys* From βαιος, small, and βοτρυς, a bunch, the flowers growing in little bunches. An elegant shrub with white flowers, produced freely from the axillæ of the leaves

444. *Solandra* In honor of the celebrated and excellent Daniel Solander, whose botanical merits will never be forgotten in this country He accompanied Sir Joseph Banks in his voyage with Captain Cook, and the information affbrded by his manuscript notes made at that time has not yet been exhausted. The species are very beautiful, and remarkable for the extraordinary size of their flowers Sweet observes, "if allowed plenty of room and moisture, they grow very rapidly, but produce no flowers The best way is to plant them in a loamy soil, and allow them to grow fast at first, till they have made a great many shoots, then keep them very dry till their leaves drop off, and they will produce plenty of flowers. Cuttings taken off and stuck in a pot of mould, will root without any further care The best way to have plants flower young, is to take the cuttings from the flowering shoots" (*Bot Cult* 107)

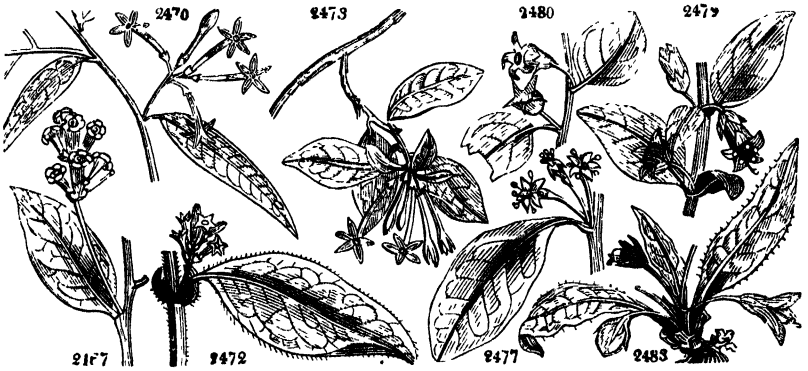
445 *Cestrum.* A name given by the Greeks to the Betony, but having no relation whatever to the plant which bears the name now *Cestreau*, Fr. This is a genus of easy cultivation, but of little beauty. The flowers are all white, and in some cases sweet-scented, the fruit of all poisonous

446 *Atropa* A mythological name Atropos was one of the Fates, and it was her especial duty to cut the thread of human life. The fruit of this genus is well adapted to fulfilling her office. A belladonna (fine lady) has

2451 Scandent quite smooth, Leaves lanceolate, Flowers axillary subsolitary

2452 Leaves 3 or 4 together lanceolate acuminate shining, Flowers terminal
2453 Leaves 4 together oblong ovate acuminate pubescent, Flowers terminal and axillary
2454 Leaves 4 together oblong narrowed both ways tomentose, Flowers terminal and axillary
2455 Leaves 3 together oblong acuminate smooth, Flowers between the petioles corymbose

2456 Leaves lanceolate cymbiform incurved at end



2457 Leaves oblong ovate acuminate coarsely serrated

2458 Leaves smoothish stalked, Anthers of the same shape
2459 Flowers stalked, Segm. of flower long acuminate revolute

2460 Filaments toothed or naked, Leaves elliptical coriaceous shining, Flowers fascicled stalked
2461 Filam. toothed, Leaves ovate oblong acuminate smooth, Flowers fascicled sessile
2462 Filam naked, Segm of cor emarginate, Flowers racemose, Leaves ovate and lanceolate
2463 Filam. toothed, Peduncles racemose as long as leaves
2464 Filam toothed or naked, Flower-bearing stem panicled, Stipules linear
2465 Filam naked, Stipules amplexicaule lunate, Leaves ovate, Flowers panicled terminal
2466 Filam naked shorter than throat of cor Flowers aggreg sessile terminal and lateral, Leaves elliptical
2467 Filam naked, Pedunc elong as long as leaves spiked at end, Leaves oblong, Stip elliptical
2468 Filam naked, Segm of cor rounded reflexed, Leaves lanceolate
2469 Leaves lanceolate oblong coriaceous, Flowers sessile
2470 Filam toothed, Flowers racemose, Leaves linear lanceolate
2471 Flowers clustered sessile terminal, Branches leaves and calyxes downy
2472 Filam toothletted, Spikes axillary longer than leafstalks, Leaves obl. pub. on both sides, Stip falcate
2473 Filam. naked the length of the tube of the corolla, Flowers aggreg sessile terminal, Leaves elliptical
2474 Filam naked, Leaves lanceolate, Racemes short axillary and terminal, Cor revolute
2475 Filam naked, Leaves lanc ovate, Racemes axillary and terminal, Flowers pedicellate, Cor. acum. reflex
2476 Filam toothed, Leaves ovate acute wavy, Pedunc axillary and terminal few flowered
2477 Filam naked exserted, Flowers stalked clustered, Cor campanulate, Leaves elliptical
2478 Leaves large ovate acute entire shining naked on both sides coriaceous nerved, Petioles black shining

2479 Stem herbaceous, Leaves ovate entire
2480 Stem shrubby, Peduncles clustered, Leaves cordate ovate obtuse
2481 Stem shrubby, Leaves oblong entire smooth, Branches downy, Sepals aristate
2482 Stem shrubby, Peduncles clustered, Cor revolute, Leaves oblong

2483 The only species

and Miscellaneous Particulars

its specific name, according to some, from its being used as a wash among the ladies, to take off pimples or other excrescences from the skin, or, according to others, from its quality of representing phantasms of beautiful women to the disturbed imagination The inspissated juice of the berries is used in the form of extract for anointing the eyelids in some opthalmic complaints. Its effect in dilating the pupil is quite remarkable It has branching stems with the root leaves often a foot long and five inches broad, and the whole plant is more or less tinged with purple The flowers are void of scent, the berries are larger than cherries, at first green, but when ripe of a beautiful shining black color, full of purple juice, with roundish dotted channelled seeds The whole plant, and especially the berries, is poisonous Buchanan relates the destruction of the army of Sweno the Dane, when he invaded Scotland, by the berries of this plant, which were mixed with the drink which the Scots, according to truce, were to supply the Danes with The Danes became inebriated, and the faithless Scots fell on them in their sleep Dr Milne (*Indigenous Botany*) remarks, that nature has been more parsimonious in her warnings with respect to this plant, than to others of the same natural family Neither the smell nor the taste is offensive, and if the color of the flowers proves in some degree a repellant, that of the fruit, on the other hand, is in an equal degree, at least, attractive and inviting

447 *Mandragora* From *μανδρα*, something relating to cattle, and *αγαυης*, hurtful · dangerous to cattle It is a venomous plant, and was an important engine in the days of medical charlatanry, from the roots being supposed to bear a resemblance to the human form In old herbals the figures display the male mandrake with a long beard, and the female with a prolix head of hair. Miller says, "mountebanks carry about fictitious images, shaped from roots of bryony and other plants, cut into form or forced to grow through moulds of earthenware, as mandrake roots" Happily such mountebanks have ceased to exist in Britain On the continent they are still common, and Box tells us (in 1810), that by means of a few cuts with a knife, they add the image of the exterior organs of generation, male or female, to mandrake roots, and then sell them to ensure boys or girls to pregnant women, procure happy births, &c We have ourselves seen them exposed by mountebanks in sea-port towns of France For an ingeniously indelicate figure of a mandrake root, see the Flora Græca, the plates for which have been all selected by Sir James Smith The plant is of easy culture, but is the better for the protection of a frame or shelter of a south wall during winter.

History, Use, Propagation, Culture.

448 *Physalis* From φυσις, a bladder The fruit is enclosed in an inflated calyx. The berries of P. alkekengi are acidulous and slightly bitter, they were esteemed detergent and aperient by the ancients. In Spain, Germany, and Switzerland, they are eaten as a common fruit. Phy peruviana produces a pleasant fruit for tarts, and is in some countries, and even English gardens, cultivated for that purpose

449 *Saracha* A plant resembling Atropa, or Physalis, to which it is too nearly related It was named by the authors of the Flora Peruviana after Isidore Saracha, a Spanish botanist

450 *Lycium* So called because the original species was a native of Lycia, a country of Asia Minor Some of the Cape species of this genus have elegant flowers and merit cultivation, and L. barbarum is valuable for covering naked walls, arbors, &c It grows four or six feet in a season, flowers freely, and is readily propagated by cuttings at any season of the year L. europæum is used for hedges in Tuscany, being armed with small thorns. Clusius says they eat the small shoots in Spain with oil and vinegar L. ruthenicum is an ornamental shrub from its very white bark. The greenhouse species root readily in sand under a hand-glass.

451 *Solanum* By some ingenious commentators this word has been derived from *solari*, to comfort. The derivation may be possible, but the application is not evident This extensive genus, which belongs to the Luridæ of Linnæus's system of natural orders, does not contain many handsome plants, but it includes, besides the Tomato and egg plant, celebrated in cookery, the potatoe, whose tubers, as a human food, if equalled, are not surpassed by those of any other plant. Some of the species are singular on account of their leaves and

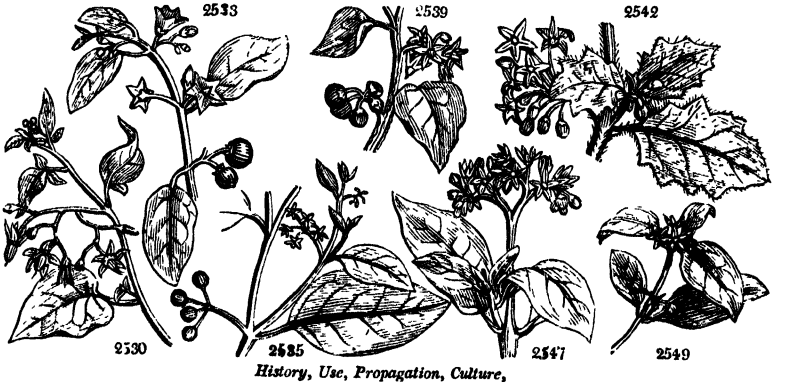
2484 Stem shrubby rounded, Branches upright, Flowers clustered
2485 Stem shrubby, Branches flexuose, Flowers clustered
2486 Stem shrubby, Leaves ovate tomentose
2487 Leaves in pairs repand obtuse subtomentose, Stem herbaceous panicled above
2488 Leaves ovate subrepand obtuse nearly naked, Flowers in pairs, Stem herbaceous
2489 Leaves in pairs entire acute, Stem herbaceous branching below
2490 Pubescent, Leaves cordate entire
2491 Pubescent, Stem angular, Leaves in pairs cordate nearly entire soft, Teeth of cal. acuminate
2492 Much branched, Branches angular smooth, Leaves ovate toothed
2493 Pubescent, Stem erect ½ shrubby, Leaves subcordate toothed angular, Petioles decurrent
2494 Much branched, Leaves ovate cordate pub Flowers pendulous, Calyx in fruit ovate acuminate angular
2495 Much branched, stalk of fruit much longer than the villous leaf
2496 Much branched, Leaves villous, Peduncles erect
2497 Much branched, Stem procumbent rounded hairy. Leaves rather fleshy
2498 Pubescent, Leaves ovate angular, Stem herbaceous, Berries viscid, Root tuberous
2499 Hairy, Leaves cordate acute toothed, Pedunc at length reflexed, Cal with segm twice as short as cor
2500 Leaves oval unequal acute toothed smoothish, Flowers solitary, Calyx powdered, Cor tomentose
2501 Leaves in pairs toothed repand tomentose-viscid oval, Stem herbaceous panicled above

2502 Leaves in pairs unequal ovate smooth, Flowers in umbels
2503 Stem erect hairy, Umbels axillary stalked cernuous, Flowers plaited

2504 Branches diffuse spiny, Leaves linear fleshy attenuated at base fascicled, Pedunc longer than cal.
2505 Branches upright spiny, Leaves linear fascicled, Pedunc. shorter than calyx, Stam as long as tube of cor
2506 Branches droop. spiny, Lvs. lin. lanc atten. at base fast Ped longer than cal. Stam as long as limb of cor
2507 Branches drooping, Buds spiny, Cal trifid, Stam as long as limb of cor.
2508 Branches drooping spiny rounded, Leaves sessile lanceolate acuminate, Cal trifid, Berry turbinate
2509 Branches lax spiny, Leaves oblong lanc. obtuse obliquely bent, Stam. shorter than limb of cor
2510 Branches erect flexuose at end recurved rounded much spreading spiny, Leaves subsessile lanc acute
2511 Stem and branc droop striated rarely spiny, Lvs stalked ov. obt Cal. 5-toothed, Style longer than stam.
2512 Spiny, Leaves obovate fleshy smooth, Peduncles very short
2513 Spiny, Leaves ovate entire acute glaucous, Flowers panicled
2514 Unarmed, Leaves narrow spatulate oblong, Flowers 4-cleft tetrandrous
2515 Erect spiny, Branc. dif. angular, Lvs. stalked lanc. acute, Cal 2 or 3-fid, Style scarcely longer than stam.

§ 1 *Lycopersicon* (*Love Apples*) *Anthers conical, joined at end. Berry many-celled*
2516 Villous hoary, Leaves stipulaceous unequally pinnatifid, Segm obtuse, Pedunc and pedicel bracteated
2517 Hairy, Leaves unequally pinnatifid, Segments cut glaucous beneath, Berries torulose furrowed smooth
2518 Hairy, Lvs unequally pinnat. Segm cut glauc beneath, Sepals as long as cor Berries round rather hairy
2519 Hairy, Lvs unequally pinnat Segm cut glauc beneath, Pedunc with bract Sepals twice as long as cor
2520 Hairy, Lvs unequally pinnatifid, Segm cut glaucous beneath, Pedunc without bract. Berries obconical

§ 2 *Unarmed Leaves pinnate, pinnatifid, or entire*
2521 Root tuberous, Stem herbac Segm of lvs unequal, the altern ones minute, Pedicels stalked, cor. 5-ang.
β Root tuberous, Stem herbaceous, Leaves pinnate sublyrate pilose, Pedic jointed, Cor 5-cleft
2522 Leaves pinnate waved, upper simple lanc Racemes in panicled cymes sometimes longer than petioles
2523 Leaves cordate ovate oblong hairy on each side waved at edge, Racemes pendulous as long as petioles
2524 Stem halt shrubby rooting ascending runners muricated, Lvs obl lanc pubescent simple, Racemes 2-fid
2525 Smooth, Leaves pinnatifid segments linear lanceolate terminal elongated, Racemes lateral corymbose
2526 Stem angular wavy rough, Leaves pinnatifid, Racemes cymose
2527 Stem rounded prostrate rooting, Lvs deeply pinnat Sinuses obtuse, Racemes cymose as long as petioles



and Miscellaneous Particulars

spines, and others retain their fruit in our stoves during winter, which may be a recommendation to some to admit them in collections

S. dulcamara has roots which smell like the potatoe; being chewed, a sensation of bitterness is first felt, and then of sweetness, whence the specific name The berries excite vomiting and purging, and the twigs and leaves have been used in rheumatic and scorbutic cases with good effect

S. tuberosum, *Pomme de Terre*, Fr., *Kartoffel*, Ger, *Pomo de Terra*, Ital, *Potades*, Span, &c. is supposed to be a native of South America, and to be found in a wild state in elevated places in the tropical regions, and in the more temperate districts of the western coasts of that country Some tubers, said to be of the wild potatoe, have been received from these parts by the Horticultural Society, and cultivated by them, their produce differs very little, if at all, from that of the common cultivated sort, they are small, roundish, and pink and white colored. (*Hort Trans.* 5. 257.) It appears probable that the potatoe was first brought into Europe from the mountainous parts of South America in the neighbourhood of Quito, where they were called *papas*, to Spain, early in the 16th century From Spain, where they were called *battatas*, they found their way to Italy, and there received the same name as the truffle, *taratoufli*. From Italy they went to Vienna, through the governor of Mons in Hainault, who sent some to Clusius in 1598 To England the potatoe found its way from North America, being brought from Virginia by the colonists sent out by Sir Walter Raleigh in 1584, and who returned in July 1586; and, "probably," says Sir Joseph Banks. "brought with them the potatoe." Gerarde,

History, Use, Propagation, Culture,

in his Herbal, published in 1597, gives a figure of the potatoe, under the name of Potatoe of Virginia, whence he says he received the roots, and this appellation it appears to have retained, in order to distinguish it from the battatas or sweet potatoe (Convolvulus battatas) till the year 1640, if not longer "The sweet potatoe," Sir Joseph Banks observes, "was used in England as a delicacy long before the introduction of our potatoes, it was imported in considerable quantities from Spain and the Canaries, and was supposed to possess the power of restoring decayed vigor The kissing comfits of Falstaff, and other confections of similar imaginary qualities, with which our ancestors were duped, were principally made of these and of eringo roots" Gough says the potatoe was first planted by Sir Walter Raleigh on his estate of Youghall near Cork, and that they were soon after carried into Lancashire Gerrarde and Parkinson, however, mention them as delicacies for the confectioner, and not as common food. Even so late as Bradley's time they are spoken of as inferior to skirrets and radishes

The use of potatoes, however, became more and more known after the middle of the 18th century, and has greatly increased in all parts of Britain within the last thirty years. It is also very general in Holland, and many parts of France and Germany, and is increasing rapidly in Russia In Spain, and the East and West Indies they are not much cultivated, owing to the heat of the climate, but in all the temperate parts of North America, Australasia, and South America they are grown by the colonists. In China they are cultivated, but not extensively, owing to the slow progress which every thing new makes in that country Indeed, no root hitherto discovered is so well adapted for universal use as the tubers of the potatoe, for, having no peculiarity of taste, and consisting chiefly of starch, their farina is nearly the same as that of grain Hence, with the flower of potatoes, puddings, and such preparations as do not call the gluten of wheat-flower into action, may be made equal to those of millet or rice, and excellent bread with a moderate proportion of good wheat-flour Potatoe starch, independently of its use in the laundry, and as a hair powder, is considered an equally delicate food as sago or arrow-root. As starch and sugar are so nearly the same, that the former is easily converted into the latter, the potatoe yields a spirit equal to that of malt by distillation, and a wine or beer by the fermentative process.

The varieties of the potatoe are very numerous, differing in earliness, lateness, form, size, color, and quality. The names for these are quite arbitrary or local In general, every district has its peculiar or favorite varieties. Some of these degenerate, and others improve when removed from one district to another New varieties

§ 3 *Unarmed. Leaves lobed, sinuate, angular, toothed, or entire*

2528 Leaves ovate lanceolate entire or lobed, Racemes cymose opp to the leaves, Cor 5-parted
2529 Leaves lanceolate sinuate tomentose bright-green, Pedunc few-flowered, Sepals ovate acute
2530 Stem wavy, Leaves ovate cordate upper lanceolate, Corymbs opposite the leaves
2531 Stem smooth, Leaves cuneate at the base sinuate smooth, Peduncles few-flowered short
2532 Leaves ovate repand angular smooth, Peduncles 1-flowered cernuous, Berries torulose
2533 Leaves ovate angular repand smooth unequal at base, Pedunc. 1-flowered cernuous, Berries round
2534 Leaves oblong lanceolate subrepand, Peduncles 1-flowered outside the leaves
2535 Branches rounded, and leaves smooth ovate entire, Flowers umbelled
2536 Branches smooth angular toothed, Leaves ovate smooth entire, Flowers numerous umbelled
2537 Stem and branches angular toothed, Leaves subovate sinuate angular, Flowers umbelled
2538 Leaves ovate toothed angular ciliated, Umbels extrafoliaceous stalked
2539 Stem angular, Leaves ovate toothed naked, Flowers in umbels
2540 Branches strigose pubescent angular winged, Wings toothed, Leaves ov rep smooth, Flowers in umbels
2541 Branches angular toothed pubescent, Leaves ovate repand upper entire, Flowers in umbels
2542 Stem rounded villous, Leaves ovate angular toothed villous hoary, Flowers in umbels

§ 4. *Unarmed Leaves quite entire*

2543 Stem shrubby, Branches powdery, Leaves oblong lanceolate powdery on both sides, Racemes spreading
2544 Leaves ovate and subcordate waved curled acuminate, Flowers corymbose
2545 Leaves oval pointed at each end smooth, Racemes cymose
2546 Stem erect, Leaves ovate lanceolate attenuated at each end pubescent, Racemes 2 and 3-chotomous
2547 Leaves ov obl acuminate entire downy, Surface discol Axils leafless, Corymbs terminal dichotomous
2548 Leaves ovate oblong acuminate woolly axillary, Leaflets semicircular, Corymbs di-trichotomous
2549 Lvs in pairs one obl narrow towards each end obt other smaller obov ellipt. Cymes stalk opp the lvs
2550 Leaves ovate lanceolate acute shining smooth, Peduncles 1-flowered, Berries oval
2551 Branches spiny, Leaves elliptical, Peduncles filiform 1-flowered
2552 Stalks axillary 1-flowered, Cal 10-cleft, Leaves mostly in pairs subsessile elliptical
2553 Stem climbing flexuose, Lvs ovate lanc smooth acuminate, Pedunc in pairs, Cal unequally toothed

§ 5 *Prickly Leaves entire or sinuate-angular*

2554 Leaves discolored the lower sinuate prickly upper entire unarmed, Pedunc few-flowered
2555 Stem unarmed, Leaves lanceolate repand undulated acute
2556 Leaves lanceolate acuminate revolute on both sides at the base
2557 Stem prickly, Leaves lanceolate pubescent beneath entire edge revolute at base
2558 Leaves lanceolate repand obtuse reflexed at edge
2559 Stem prickly, Prickles acerose, Leaves cordate unarmed repand wavy, the young ones purple
2560 Leaves lanceolate oblong attenuate at each end roughish beneath prickly, Raceme short unarmed
2561 Stem nearly unarmed, Leaves ovate oblong sinuate repand rough, Corymb extrafoliaceous stalked
2562 Stem nearly unarmed, Leaves lanceolate ellipt entire above smooth beneath tomentose, Cymes mealy
2563 Stem downy, Leaves lanceolate long entire hoary beneath, Racemes terminal, Sepals subulate
2564 Stem with downy prickles, Leaves lanceolate acute unarmed above smooth beneath hoary

and Miscellaneous Particulars

are readily procured by sowing the seeds, which, with care, will produce tubers the third year, and a full crop the fourth As few of the early sorts produce blossoms, to procure seeds from them deprive the plant of its tubers as they appear, and keep the runners from which they proceed above ground, by not earthing up the plant, and blossoms and seeds will soon be produced This Mr Knight completely proved, and the rationale is developed in the Philosophical Transactions for 1806 It appears that the same sap gives existence both to the tuber and blossom, and that whenever a plant of the potatoe affords either seeds or blossoms, a diminution of the crop of tubers, or an increased expenditure of the richness of the soil, must necessarily take place This led Mr Knight to attempt the practice adopted by the Dutch florists with their bulbous flowers, viz to pinch off the flowers to strengthen the bulbs This, in the potatoe, Mr. Knight thinks may add an ounce in weight to the tubers of each plant, or considerably above a ton per acre The practice is now general among scientific cultivators even in field culture

The curl is a well known disease of potatoes, which frequently disappoints the cultivator of a crop, or renders that produced of little value A great variety of opinions exist as to this disease without enumerating these, we may state, as the general result of experiments by different persons, that the curl arises in most, or at least in many cases, from using over ripe tubers as seed stock, or from the employment of seed stock which has been injured or improperly kept during the winter, that is, kept exposed to the light and air instead of being covered with earth, or sand, or straw, so as to preserve their juices The experiments of various farmers and gardeners, as recorded in the Farmer's Magazine and Caledonian Hort Mem, lead to the above conclusions

The culture of the potatoe, both in the field and garden, is universally known It may be forced in pots or on dung or tan beds, and, for this purpose, using sets from tubers that have been retarded a year in an ice-house or cold place, is found a great advantage Thus, in planting in December 1823, use tubers of crop 1822. These, from the long period of repose which they have had, will be found highly excitable by heat, and of much more rapid growth than sets of the preceding crop As matter of curiosity, boxes containing alternate layers of light earth and potatoes of the last season but one may be placed in any dry covered place, free from frost, in November, and they will produce a brood of young tubers in contact with the old ones on the December following, without either leaves, roots, or runners. (*Hort. Trans* i 225)

Potatoes are best preserved by burying in pits in dry ground, so deep as to be under the influence of surface temperature, or so enveloped with thatch as to produce the same effect At a certain depth, they will keep

History, Use, Propagation, Culture,

for years without vegetation Where there is an ice-house, they may, when taken out of the pits, be kept in small quantities in it till wanted for use

S. lycopersicum (From λυκος, a wolf, and *persica*, a peach, in poetical allusion to the beautiful appearance and deceitful value of the fruit) *Tomate*, Fr, and *Pomo d'oro*, Ital, is cultivated extensively about Naples and Rome for the use of the berry in sauces, stewing, and soups. It is one of the most common articles used in Italian cookery, and makes an excellent sauce for fish, meat, and general purposes Its use for sauce in this country is greatly on the increase, and it is cultivated to considerable extent near London, against walls and artificial banks, being raised on a hot-bed, and transplanted like other tender annuals.

S. nigrum, a very common plant on dunghills, is narcotic and poisonous like S. dulcamara and Atropa belladonna. A Spanish cure for the consumption is burying up to the chin in garden earth, and afterwards rubbing the body over with an ointment made from the leaves of this plant.

S. æthiopicum is cultivated in China for the fruit, which is served at the tables of mandarins like our cherries.

S. melongena, (M from *bydendjân*, its Arabic name, according to Forskahl) is cultivated both in Europe and the East and West Indies for its fruit, which is used boiled, stewed in sauces, &c like that of the love-apple. The plant is more tender, and in this country requires to be matured under glass, like the balsam and other tender annuals S. muricatum resembles it in habit, and may be cultivated for the same purpose

452. *Nycterium.* From νυξ νυκτος, night. A small tribe of plants cut off from their ancient genus Solanum. N amazonium is quite a beautiful shrub, growing well in pots in a moderate stove.

453. *Capsicum.* From κάπτω, *mordeo*, to bite, on account of the biting heat of the seed and pericarp. *Poivre d'Inde ou de Guinée*, Fr. The fruit of C baccatum, commonly called bird pepper, is gathered when

§ 6. *Prickly Leaves sinuate, angular and lobed*

2565 Stem prickly, Leaves ovate subsinuate downy prickly, Flowers many-parted, Seeds naked
2566 Stem prickly, Leaves ovate tomentose, Pedunc. pendulous thick, Cal. prickly
2567 Stem nearly unarmed, Leaves ovate subrepand tomentose unarmed, Berries ovate oblong, Seeds pulpy
2568 Stem diffuse, Prickles straight dilated at base, Lvs obl sinuate pinnatifid, Pedunc. 2-fid, Berries globose
2569 Stem prickly, Leaves oblong tomentose sinuate angular, Segm. sinuate toothed, Sepals reflexed
2570 Leaves ovate oblong sinuate repand downy white beneath, middle nerve beneath with smooth prickles
2571 Leaves subcordate sinuate lobed beneath hoary above white at edges, Berries 3-celled globose
2572 Stem very prickly hairy, Lvs. cord. obl. lob. Lobes tooth Fertile cal. very prickly, Berries cher -shaped
2573 Stem very prickly, Lvs cordate lob Lobes acute toothed villous and prickly on both sides, Berries round
2574 Stem vil with scat. prickl. Lvs subcord. lob. prickly on both sides very vil Ber like the teat of an animal
2575 Stem prickly, Lvs cordate sinuate acutely lob vil. and prickly on both sides, Pedunc. and cal unarmed
2576 Stem prickly, Lvs cord. angular toment. with the racemes and calyxes prickly, Ber hairy cov. by calyx
2577 Stem prickly, Leaves smoothish lobed obtuse prickly, Peduncles in pairs
2578 Stem prickly, Leaves 3-lobed obtuse smooth, Flowers racemose violet
2579 Stem prickly, Leaves ovate oblong tomentose sinuate angular acuminate, Racemes simple ax
2780 Stem prickly, Leaves oblong acute sinuate pinnatifid downy, Prickles straight scarlet
2581 Stem erect prickly, Lvs pinnat. sinuated prickly on both sides, Segm sinuated obtuse, Racemes prickly
2582 Stem decumbent diffuse prickly, Leaves sinuate pinnatifid prickly on both sides smooth, Calyxes prickly

§ 7 *Prickly Leaves pinnatifid or bipinnatifid, Berries covered by the enlarged and prickly calyx*

2583 Stem villous prickly, Lvs. pinnatifid, Segm. acute sinuate toothed, Racemes cymose lateral and terminal
2584 Stem shrubby rounded prickly, Leaves bipinnatifid prickly on both sides villous

2585 Leaves cordate entire, Racemes divided, Cal unarmed
2586 Leaves elliptical sinuate tomentose, Flowers several large terminal
2587 Stem and leaves prickly, Leaves ovate pinnatifid hairy on both sides
2588 Stem woody prickly hairy, Leaves deeply pinnatifid, Anthers small

2589 Fruit oblong pendulous and erect their stalks smooth, Stem herbaceous
2590 Fruit globose pendulous, Stalks smooth, Stem shrubby
2591 Fruit globose ovate erect in pairs, Stalks smooth, Stem shrubby
2592 Fruit ovate pendulous in pairs, Stalks pubescent, Stem shrubby
2593 Fruit oblong ovate subcompressed erect, Stalks smooth, Stem herbaceous
2594 Fruit oblong obtuse, Stalks smooth, Stem erect
2595 Fruit oblong mucronate, Stalks smooth, Stem shrubby
2596 Fruit globose, Stalks smooth, Stem shrubby
2597 Fruit oblong, Stalks pubescent, Stem shrubby
2598 Fruit oblong acuminate incurved, Stalks smooth, Stem herbaceous
2599 Fruit heart-shaped, Stem herbaceous
2600 Fruit very large angular obtuse, Stem herbaceous
2601 Fruit heart-shaped angular, Stem herbaceous
2602 Fruit ovate conical erect, Stem half shrubby
2603 Leaves linear lanceolate, Fruit pyramidal erect yellow, Stem shrubby
2604 Fruit ovate erect, Footstalks and leaves pubescent, Teeth of the calyx 5 subulate spreading
2605 Young stalks ciliated, Berries erect globose
2606 Leaves ovate acuminate, Stalks ciliated, Cal. obtuse

and Miscellaneous Particulars

ripe, dried in the sun, pounded and mixed with salt it is then kept stopt in bottles, and is commonly known by the name of Cayenne-pepper A mixture of sliced cucumbers, shallots or onions cut very small, a little lime juice and Madeira wine, with a few pods of bird pepper, well mashed and mixed with the liquor, seldom fails to provoke the most languid appetite in the West Indies. It is there called Man-dram. Gathered fresh from the plant, the pods of all the species are liberally used both in the East and West Indies, to assist digestion and correct flatulencies

C frutescens and minimum, the latter by many considered only a variety of the former, low shrubs with an oval red berry more sharp and biting than any of the others, furnish the Cayenne pepper of the shops. The ripe pods are dried in the sun, and then in an oven after bread is baked, in an earthen or stone pot, with flour between the strata of pods When quite dry they are cleaned from the flour, and beaten or ground to fine powder To every ounce of this, a pound of wheat flour is added, and it is made into small cakes with leaven, these are baked, cut into small pieces, baked again that they may be as dry and hard as biscuit, and then are beaten into powder and sifted It is then fit for use as a pepper, or for being packed up, in a compressed state, and so as to exclude air, for exportation

C annuum, *Piment*, Fr, *Spanischer Pfeffer*, Ger, *Peperone*, Ital., is cultivated for its fruit, which is used in a green state for pickling, and ripe for mixing with other ingredients, as Tomatos, &c. to form sauces. They are also dried and ground, and used like Cayenne pepper. The seed is sown in the end of March or beginning of April on a moderate hot-bed, and covered a quarter of an inch. When the plants are two or three inches in growth, some are transplanted into a new slight hot-bed to forward them for final planting, or in default of such a hot-bed, they are placed in a bed of light rich earth, from twelve to eighteen inches apart, where they are finally to remain in the end of May, and protected during night by mats They will flower in July, and

History, Use, Propagation, Culture,

produce plenty of pods from August till the end of September They may be also raised under hand-glasses, and in very warm situations treated as common annuals. C. cerasiforme is sometimes cultivated for the same purposes as the common capsicum

454 Leea. Named after the first James Lee, of the Hammersmith Nursery, an excellent cultivator and most worthy man. The plants have little more beauty than a hemlock. Cuttings root easily under a hand-glass in heat.

455. Spermadictyon. From σπερμα, seed, and δικτυον, a net, on account of the manner in which the seeds cover the placenta A pretty stove plant with sweet white flowers

456. Dentella. A diminution of *dens*, a tooth, the divisions of the corolla having each three little teeth.

457. Macrocnemum From μακρος, long, and νημα, a stamen.

458. Exostemma From ἐξ, out, and στημμα, a crown, in allusion to the protrusion of the stamens; one of the characters on account of which the genus has been separated from Cinchona.

The genus Cinchona, which was so named after the Countess of Cinchon, who being cured by the use of this plant, first brought it into notice, is very nearly related to this, and is a most important genus, as furnishing the Peruvian or Jesuit's bark The bark is taken from various species; but that which produces the best is said to be C officinalis, a native of Peru, and not yet introduced to this country The Jesuit's bark tree of Jamaica is the Exostemma caribæum, but land there is too valuable for its culture Our species are not very common in collections, being of slow growth, and not very easily propagated. Sweet

2607 Stem furrowed angular smooth, Leaves nearly bipinnate
2608 Stem rounded pubescent, Leaves pinnated
2609 Stem angular fringed, Leaves pinnated
2610 Stem angular, Stalks smooth, Leaves broad ovate serrated

2611 Leaves opposite ellipt. Flowers terminal in umbels

2612 Stem creeping much branched smooth, Leaves stalked opposite oval flat entire

2613 Corymbs axillary long naked
2614 Leaves elliptical acute opposite, Flowers whorled sessile

2615 Peduncles axillary and terminal 1-flowered, Leaves ovate lanceolate
2616 Flowers terminal panicled smooth, Caps. terminal smooth, Leaves elliptical acuminate smooth

2617 The only species A fine plant with tubular red flowers like a honeysuckle

2618 Leaves sessile, Panicle dichotomous
2619 Leaves stalked elliptical acute smooth
2620 Leaves oblong acuminate hairy rigid nerved beneath, Stalks axillary erect

2621 The only species. An hexandrous plant

2622 Flowers pentandrous, Leaves lanceolate elliptical
2623 Flowers pentandrous, Leaves ovate coriaceous

§ 1 *Leaves smooth.*

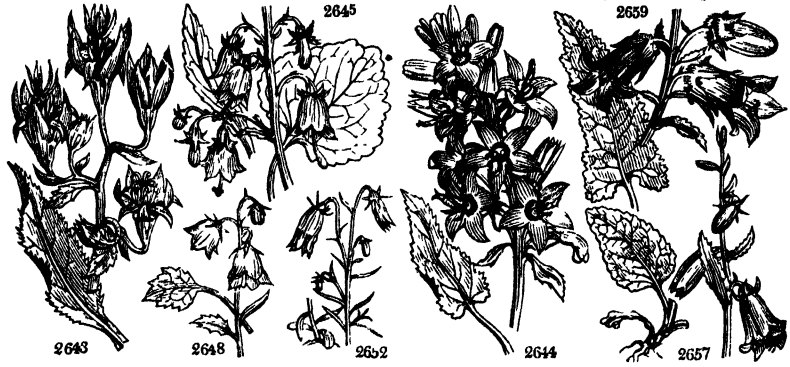
2624 Stems 1-flowered, Leaves ovate smooth subciliated
2625 Lower leaves obovate wedge-shaped crenate, Upper linear entire, Stem simple 1-flowered
2626 Stem 1-flowered naked, Leaves stalked elliptical lanceolate deeply toothed
2627 Little stems 1-flowered, Radical and cauline leaves ovate subcrenate, Cal cernuous
2628 Stems about 3-fl Lvs entire, the rad ov on long stalks, the cauline obl ov sessile obtuse, Fls nodding
2629 Lvs. all cordate serrate stalked smooth, Branches filiform 1-flow Cal reflex glutinous, Cor spreading
2630 Smooth, Radical leaves oblong and kidney-shaped serrate cauline linear entire
2631 Smooth, Leaves all serrate radical cordate ovate firm shining, cauline linear alternate remote
2632 Radical leaves ovate crenate with flattened stalks, Flowers racemose 1-sided cernuous
2633 Stem hairy decumb angular, Lvs stalk ser. smooth, rad. cordate, lower cauline ovate, Cor short large
2634 Stem filiform angular striated, Branches about 1-flowered, Leaves lanceolate or linear, Flowers 5-cleft
2635 Pubescent, Lvs rather hairy rad. obov rounded serrated, cauline clustered lin entire, Sepals setaceous
2636 Leaves upright · radical lanceolate-oval, Panicle spreading
2637 Leaves wavy · radical lanceolate-oval, Panicle contracted
2638 Stem angular, Lvs stiff obsoletely crenate serrate rad. obl obovate; cauline lanc lin Flow large

2639 Lvs smooth ov. cord. cartilaginous-serrated, the caul lanc Stem upright elong branch Lower ped. 3-fl
2640 Lvs. obl lanc point. at each end serr with veins hairy beneath, Stem erect, Rac term. Seg of cor obliq.
2641 Lvs cord. and lanc serr lower stalks ciliated, Fls axill sessile, Cor 5-parted flat, Style longer than cor

and Miscellaneous Particulars

advises cuttings to be "taken off when ripe, planted in a pot of sand, plunged in moist heat, and covered with a bell-glass"

459 *Burchellia* Named by Mr Robert Brown, after William Burchell, a traveller in the southern part of Africa, from whom we have two volumes of travels, and the promise of other works hereafter The species is a beautiful dwarf shrub with scarlet flowers in terminal clusters.



460 *Rondeletia* Plumier established this genus in memory of William Rondelet, a scientific physician, whose attention was chiefly occupied by fishes and algæ He was born in 1507, and died in 1566. Rabelais ridicules him under the name of Rondibilis He is said to have given a disgusting proof of his fondness for anatomy by dissecting his own son

461 *Coutarea.* So named by Aublet from its vernacular name in Guiana, *Coutari.* A most beautiful plant, requiring the utmost heat of the stove, but very rare in gardens, if it indeed exists in cultivation at all now.

462. *Portlandia.* In honor of the Duchess of Portland, once a famous patroness of botany. Splendid plants of the natural order Rubiaceæ Portlandia grandiflora is common and easily grown. P. coccinea is perhaps not in the country, although stated to have been introduced in 1775

463 *Campanula* A diminution of *campana*, a bell; on account of the form of the corolla, which resembles a little bell Rapunculus is a diminution of *rapa*, a radish, in allusion to the nature of its root. Speculum is so called because the corolla in its form resembles a little round and elegant mirror (speculum), whence in

History, Use, Propagation, Culture,

English it is called Venus' looking-glass Ancient mirrors were always round, on which account the astrological sign of Venus was ♀, or a figure of the antique mirror and its handle This is a shewy genus, some of the species are beautiful, and all of them of easy culture in the borders of the flower garden or shrubbery One or two species are used in dietetics, and probably the roots of the whole might be eaten. Almost all the species have long thick white roots, which abound in an acrid milky juice

C rapunculus is much cultivated in France and Italy, and sometimes in Britain, for the roots, which are boiled tender and eaten hot with sauce, or cold with vinegar and pepper It is sown in Spring on deep light soil in drills, and will be ready for use by the autumn of the same year. C persicifolia and Rapunculoides may also be cultivated for the same purpose

C. pyramidalis was a very fashionable plant thirty years ago, and is still cultivated, but has given way to Lobelia splendens and fulgens It is still in demand in Holland as an ornament to halls, staircases, and for being placed before fire-places in the summer season, for which purpose it is planted in large pots, and trained in the fan manner, so as to cover a large surface In the shade it will continue in flower for two or three

2642 Leaves oblong crenulate rigid sessile, Flowers erect flat
2643 Caps. 5-celled, Leaves elliptical serrate smooth, Flowers panicled 5 parted, Stems shrubby fleshy
2644 Leaves cordate serrate smooth, Thyrse terminal, Sepals subulate, Corolla rotate spreading
2645 Leaves lanceolate cauline acutely serrated, Flowers panicled nodding
2646 Leaves stalked subcordate acutely serrated, Flowers small nodding, Style exserted
2647 Leaves ternate oblong finely serrated, Stem 1-flowered, Flower spreading
2648 Leaves rhomboidal serrated, Spike one-sided, Cal toothed
2649 Leaves about 6 lanceolate toothed, Flowers whorled [very long
2650 Stem erect, Lvs altern opp. and ternate lin. lanc entire, Pan pyram Flowers cernu glob. trunc Style
2651 Stem branched upright twiggy, Lvs. lin lanc toothed, Pedunc. filiform long, Cor funnel-shaped 3-4-cleft
2652 Smooth, Stem 1-fl Lower lvs. obl. cauline lin. subsetaceous, Cor. cernuous with the bott. of seg cut out

§ 2 *Leaves rough.*

2653 Stem rounded striated smooth, Lvs ovate lanc doubly serrated, Pedunc axillary 1-fl erect, Cal smooth
2654 Stem furrowed pubescent, Leaves ovate-lanceolate doubly serrate, Pedunc axillary solitary, Cal woolly
2655 Stem angular hispid, Lvs. ov lanc coarsely serrated, Pedunc axillary 1-flowered cernuous, Cal hispid
2656 Stem angular, Leaves stalked, Cal ciliated, Peduncles trifid
2657 Leaves cordate-lanceolate, Stem branched, Flowers one-sided scattered nodding, Cal reflexed
2658 Leaves oblong unequally toothed rough beneath, Stem panicled, Bractes and calyx ciliated
2659 Leaves downy. lower cord lanc stalked, Flower nodding, Germens woolly
2660 Leaves ovate lanceolate beneath scabrous sessile, Stem panicled [very long
2661 Stem rounded and lvs. beneath tomentose, Lower lvs cordate lanc stalked, upper sessile, Raceme term.
2662 Stem angular simple smooth, Leaves scabrous oblong lanceolate cordate sessile, Head clustered
2663 Stem angular subsimple hispid, Rad lvs ovate cordate stalked cauline cordate sessile, Flowers clustered
2664 Hispid, Flowers sessile, Head terminal, Leaves lanceolate linear wavy
2665 Stem simp few-fl Lvs hairy, lower cord lanc. stalked, upper obl sessile, Flowers nodding, Cal hispid
2666 Leaves ovate-oblong sessile serrated, Stem simple angular, Flowers panicled
2667 Leaves lanc twin serr and branched stem hispid, Flowers panicled, Calyxes hispid, Seg dilated serrated
2668 Stem angular smooth, Caul leaves sessile equally toothed wavy lanceolate, Floral cordate, Cor tubular
2669 Hispid, Raceme ovate oblong terminal, Stem quite simple, Leaves linear lanceolate
2670 Leaves ovate rugose, Leafstalks with a dilated and serrated edge, Stem simple hispid, Flowers spreading
2671 Leaves oblong waved hairy, Flowers terminal cernuous, Cal smooth
2672 Leaves lanceolate toothed hispid, Pedunc. very long 1-flowered with strigose capsules

§ 3 *Capsules covered by the reflexed recesses of the calyx* Medium

2673 Stem simple erect pubescent, Lvs lanc. crenate, Racemes simple with nodd flowers, Cor bearded inside
2674 Hairy, Radical leaves stalked ovate acute serrate, Flowers cernuous dotted inside villous
2675 Stem undivided erect hispid. Leaves lanceolate obtusely serrated sessile 3-nerved at base, Flowers erect
2676 Hispid, Caps 5-celled, Branches pyramidal, Peduncles axillary, Flowers erect solitary
2677 Hispid, Spike lax, Flowers alternate, Leaves linear entire
2678 Stem simple, Pedunc axillary 1-flowered 2-leaved
2679 Caps 5-celled covered stalked, Stem prostrate, Leaves very soft nearly round
2680 Caps 5-keeled covered, Flowers alternate nodding, Leaves obovate crenate
2681 Radical leaves reniform coarsely doubly serrate cauline ovate toothed sessile
2682 Leaves reniform cordate doubly crenate stalked tomentose beneath, Flowers one-sided reflexed
2683 Stem panicled pubescent, Leaves lanceolate obtuse wavy
2684 Stem simple diverging pubes Lvs lanc obtusely serrated sessile veiny, Pedunc axill 3-fl and terminal
2685 Hispid, Stem simple, Flowers capitate terminal, Leaves lanceolate obtuse crenate
2686 Lvs obovate wavy rough, Stem creeping, Branches erect few-flow Segm of the hispid cal nearly equal
2687 Caps stalked, Leaves serrated, radical lyrate, cauline lanceolate nearly wedge shaped
2688 Radical leaves stalked cord. doubly serr Raceme few-flowered lax
2689 Caps. covered, Leaves oblong wavy hispid, radical sinuated, Flowers clustered sessile terminal

2690 Leaves woolly · radical lyrate, cauline rounded ovate serrate, Flowers cernuous

§ 4 *Corolla in some degree unequal, Stigma nearly simple, Capsule opening at the end*

2691 Stem dichotomous, Leaves sessile, the upper opp 3-toothed
2692 Leaves cordate 5-lobed stalked smooth, Stem lax

and Miscellaneous Particulars.

months The art of producing a very large plant is to begin with pots of a small size, and shift frequently during two years, till at last the plant occupies a pot of a foot or more in diameter. Rich light soil should be used, but no animal manures or recent dung, as these are found very injurious. Cuttings of the roots flower the second, and seedlings the third year. C carpatica and grandiflora may be treated in a similar manner.

C. lilifolia has a singular anomaly in the leaves, which before the panicle is produced come out in a kind of rose on the summit of the stem, but are, through its prolongation, afterwards dispersed. The flowers vary much both in size and color, and the roots are eaten in China both raw and boiled.

C glomerata is a handsome rock or pot plant; it requires a dry lean soil, otherwise, as in most plants, the flowers lose the intensity of their color in that which is very rich.

C. hederacea is a very small plant, with the leaves so much resembling those of Veronica hederifolia, that Linnæus suspected it to be a hybrid.

C medium is a very ornamental border flower of the easiest culture, and with varieties, double and single,

History, Use, Propagation, Culture,

of blue, red, purple, and white flowers Like other biennials, it may either be sown where it is to remain any time after midsummer, or sown in beds in spring for transplantation

C speculum and hybrida are annual border flowers of considerable beauty.

464. *Lobelia.* In honor of M. Lobel, author of various works, and particularly of that called Icones Plantarum; he was born at Lisle in 1538, became physician and botanist to James I, and died in London in 1616 This genus furnishes some of our most splendid herbaceous plants, as L. cardinalis, fulgens, and splendens. The predominant color of the corollas is red.

L. Dortmanna (from Dortmann, an apothecary, who first sent it to Clusius), is a beautiful aquatic with leaves reflected into an elegant curve at the end, and the flowers in loose spikes

L. longiflora, which grows by most places and rivulets in the West Indies, is a very poisonous plant. Taken internally it brings on an invincible purging. If the plant be handled, and the hand be unawares applied to the eyes or lips, it brings on an inflammation In the Spanish West Indies it is called *Reventacaballos*, because horses are reported to burst with eating it.

L. fulgens, splendens, and cardinalis, are the three grand ornaments of the genus. They are readily multiplied by cuttings or slips, or by seeds when they ripen, and grow well in light rich soil The culture of L. cardinalis is given at length by Justice, who designates it "a flower of most handsome appearance, and which should not be wanting in curious gardens, on account of the rich color of its flowers" The culture of L.

§ 5 *Capsules prismatical.* Prismatocarpus

2693 Caps. columnar 5-celled, Stem shrubby, Leaves linear subulate, Peduncles very long, Panicles terminal
2694 Caps. linear 2-celled, Leaves lanceolate coarsely serrated smooth, Stem decumbent
2695 Stem very much branched diffuse, Leaves oblong crenate, Flowers solitary

2696 Stem branched at base upright, Leaves oblong crenate, Cal aggregated longer than corolla
2697 Branching diffuse, Lower leaves oblong obtuse, Upper lanceolate, Flower solitary, Cor longer than calyx
2698 Stem simple, Leaves cordate toothed stem-clasping, Flowers sessile clustered

2699 Leaves linear villous, Stem erect
2700 Leaves linear smooth, Stem erect
2701 Shrubby, Leaves linear erect close together
2702 Leaves linear one toothed on each side
2703 Leaves linear 2-celled, Scape simple naked racemose
2704 Leaves lanceolate, Raceme spiked

2705 Stem erect, Leaves lin. lanc obtuse alternate entire, Raceme terminal
2706 Stem half shrubby erect, Leaves lanc ovate serrate toothed, Rac term Pedic. as long as flowers
2707 Leaves ovate toothed hairy, Stem simple
2708 Leaves lanceolate pinnatifid toothed, Raceme terminal
2709 Leaves lanceolate toothed, Peduncles very short lateral, Tube of cor filiform very long
2710 Smooth, Lower leaves oblong toothed, upper lanceolate entire, Peduncles racemose 1-sided
2711 Erect simple slightly pubescent, Lvs obl obt. almost entire, the lower spatulate, Spike naked small flow
2712 Leaves broad lanceolate serrate below toothed decurrent, Racemes compound terminal
2713 Leaves narrow lanceolate toothed revolute at edge and stem pubescent, Raceme terminal
2714 A tall plant with rugose coarse leaves, and a long spike of fine red flowers
2715 Leaves oblong lanceolate cartilaginous-toothed and erect stem smooth, Raceme terminal 1-sided leafy
2716 Leaves narrow lanceolate toothletted flat at edge and stem quite smooth, Raceme terminal
2717 Leaves lanceolate serrated smooth, Peduncles lateral longer than the leaf
2718 Flowers axillary, Stem winged, Radical leaves ovate lanceolate with glandular reflexed teeth
2719 Lvs. ovate-obl. acute at each end unequally serrated, Flowers axillary solitary, Recesses of calyx reflexed
2720 Lvs. obl. acuminate serrated smooth, Pedunc axill 1-fl Sepals linear lanc. spreading, Anthers bearded

2721 Leaves ovate cut, Stem divided, Racemes terminal naked, Upper lip of cor. bearded
2722 Smooth, Stem ascending 4-cornered, Leaves ovate-lanceolate cut serrate twice as short as leafstalk
2723 Stem hairy, Lvs toothed serrate, the lower ov obl the upper ovate, Pedunc. axillary 1-fl Caps. inflated
2724 Stem erect, Leaves cordate obsoletely toothed stalked, Corymb terminal
2725 Smooth erect, Stem 3-cornered, Leaves ovate round repand, Pedunc longer than leaves
2726 Stem erect, Lower leaves obovate toothletted, upper lanceolate serrate, Raceme terminal 1-sided
2727 Quite smooth, Lvs. broad lanc serr. Spike many-flowered 1-sided, Sepals entire, Lower petals ov acute
2728 Radical leaves ovate, Scapes capillary
2729 Stem prostrate, Leaves lanceolate oval-crenate, Stem branched, Peduncles solitary 1-flowered very long
2730 Radical leaves spatulate repand, Cauline setaceous, Stems simple 1-flowered erect
2731 Leaves somewhat stalked lanceolate oblong toothed, Stems decumbent, Peduncles elongated
2732 Stem spreading, Lvs toothed, lower elliptic stalked, upper sess narrow lanc. Pedunc. longer than leaves
2733 Stems prostrate filiform, Leaves stalked oblong toothed
2734 Stems spreading, Lower leaves oblong toothed pubescent subsessile, Upper lip of cor reflexed
2735 Leaves ovate lanceolate deeply toothed, Peduncles axillary 2 or 3 times as long as leaves
2736 Stems angular prostrate and leaves lanceolate toothed hairy, Peduncles axillary 1-flowered
2737 Stems procumbent, Leaves lanceolate serrated, Flowers sessile spiked
2738 Shrubby hairy prostrate Leaves ovate toothed, Flowers lateral with very long stalks 2 or 3-flowered

and Miscellaneous Particulars

fulgens is given by J B Van Mons, and W. Hedges, in the Hort Trans Both confess that very little art is required. Hedges, to procure strong flower stalks, keeps the plants in pots, shifts very frequently from a smaller to a larger size, places them first in cucumber frames, and when they begin to flower in a stove. The pots in which they are allowed to flower are nine inches in diameter, and, in order to supply abundant moisture, pans are placed under the pots constantly filled with water. The soil used is equal parts of loam and leaf-mould, with a third of the whole of sand They begin to flower in July, and continue flowering through the autumn One plant so treated produced a flower-stalk which measured six inches in circumference at the base; the height of the centre spike of flowers was five feet and a half, the shoots from the bottom and sides of the main stem were in number seventeen, and rising four and a half feet

L. splendens and cardinalis may either be treated as above, or as a tender border, or as frame plants. Van Mons observes, that L. cardinalis perishes in sandy soil, but becomes strong and multiplies in loam, while, at the same time, it produces the most brilliant colors in the former The same thing may doubtless be predicted of the other species, it being a well known law of nature as to living beings, that their energies are concentrated in proportion to the obstacles thrown in the way of their expansion.

L. syphilitica has its specific name from its supposed efficacy in the cure of syphilis, among the North American Indians. Sir William Johnston purchased the secret from them, but Woodville says, its virtues have not been confirmed by any instances of European practice.

History, Use, Propagation, Culture,

465. *Phyteuma* Φυτευμα, was the name of a plant much used among the ancients for aphrodisiacal purposes. No qualities of such a kind have been ascribed to the modern plant. This is a handsome genus, and with Roella is well adapted for rock-work or pots. The roots of P. spicatum are edible, and used in Switzerland like those of the rampion.

466. *Trachelium.* From τραχυς, rough, which its leaf is in a high degree. A pretty little favorite of the flower border, easily cultivated and preserved.

467. *Roella* Named after G Roelle, professor of anatomy at Amsterdam. He procured this plant for Clifford. A pretty little leafy bush, with beautiful flowers of blue and white

468. *Goodenia.* So named by Sir J E. Smith, in honor of his friend Dr. Goodenough, Bishop of Carlisle, and a lover of natural history. Herbs or small shrubs, with alternate leaves, and terminal or axillary flowers which are generally yellow, sometimes blue.

469. *Euthales.* From ευ, well, and θαλλω, to push or sprout. Very like the last in all external characters.

2739 Stems erect, Leaves linear entire and toothed, Flowers solitary terminal
2740 Leaves lanceolate toothed, Peduncles very long
2741 Leaves lanceolate crenate smooth, Stem twining
2742 Stem prostrate, Ped. axillary solitary 1-flow. very long, Cor. hypocrateriform
2743 Leaves stalked recurved pinnatifid, Pedunc elong lat solitary 2-flowered
2744 Leaves obovate toothed shorter than the axillary solitary peduncles
2745 Leaves lanc. serrulate with long points, Racemes leafy panicled, Cal. as long as cor.

§ 1. *Flowers in heads.*

2746 Head leafy, Leaves all lanceolate
2747 Head rather leafy shorter than the linear bractes, Leaves lanceolate toothed
2748 Spike elongated cylindrical, Lower flowers remote, Leaves lanceolate crenated, Upper linear
2749 Head roundish, Bractes oblong lanceolate, Leaves linear rigid nearly entire
2750 Head roundish, Bractes ovate, Leaves linear nearly entire scarcely shorter than stem
2751 Head terminal sessile, Leaves toothed: radical cordate
2752 Head roundish longer than bractes, Radical leaves ovate cordate bluntly serrated, Cauline lin. lanceolate
2753 Bractes cordate acum shorter than the roundish head Rad lvs obl cord crenate, Caul ½ stem-clasping
2754 Spike oblong, Leaves simply crenate · radical lanceolate cordate, cauline lanceolate
2755 Spike oblong lengthened, Styles downy trifid, Radical leaves cordate doubly toothed
2756 Spike ovate, Styles hairy longer than the flower bifid, Radical leaves cordate doubly toothed

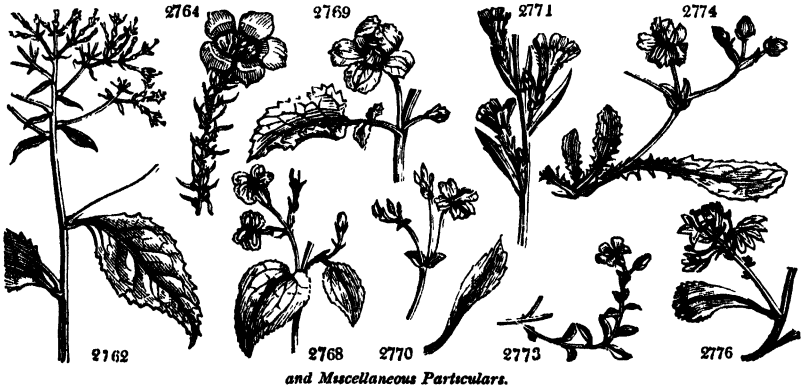
§ 2. *Flowers axillary scattered.*

2757 Branches twiggy, Lvs lanc acute at each end uneq toothed roughish, Flowers deeply divided in pairs
2758 Lvs. ovate acute sessile serrated rough, Stem angular quite simple, FL racemose sessile, lower clustered
2759 Leaves sessile, Lower obovate crenate-serrate, Upper lanceolate entire, Flowers racemose
2760 Leaves pinnate, Flowers very large in cymes
2761 Rad. leaves lin. spatulate entire, Flowers ½-whorled in 3-flowered alternate parcels

2762 Branches erect, Leaves ovate serrated flat
2763 Much branched diffuse, Branches divaricating recurved, Leaves subulate

2764 Leaves linear ciliated upright, Flowers sessile
2765 Diffuse, Leaves ovate recurved toothed, Flowers terminal aggregate
2766 Leaves lanceolate ciliated entire decurrent, Flowers solitary terminal
2767 Leaves ovate toothed reflexed smooth, Flowers terminal solitary

2768 Erect smooth, Leaves ovate acute toothed serrated, Axillæ bearded, Sepals subulate filiform
2769 Erect pubescent, Branches angular, Lower leaves lyrate, Upper obovate acute



2770 A small herbaceous plant with large entire radical leaves

2771 Leaves lanceolate entire or toothed fleshy smooth, Cor. hairy outside

2772 Stems diffuse branching, Racemes axillary and terminal
2773 Stem rounded branched leafy, Radical leaves spatulate cauline lanceolate

2774 Smooth, Bractes of the dichotomies distinct, Leaves lyrate or toothed-cut at base

2775 Leaves obovate smooth entire
2776 Spikes terminal and axillary, Leaves fleshy obovate toothed
2777 Leaves alternate obovate toothed smooth, Fruit very small
2778 Leaves entire obovate thick rough, Drupe berried (*Goodenia calendulacea.*)

and Miscellaneous Particulars.

470. *Dampiera.* Named by Mr. Robert Brown, in honor of Captain William Dampier, a famous voyager, whose knowledge and attention, in matters connected with botany, are attested by the remains of the collections made during his voyages, and now preserved in the Sherardian Herbarium at Oxford

471. *Samolus* Derived from two Celtic words, *san*, salutary, and *mos*, pig; a plant which is salutary to pigs. Pliny says, it was considered among the Gauls as a specific in all maladies of swine. The plant was collected with mystic ceremonies S. Valerandi was named after Dourez Valerand, a botanist of the 16th century, mentioned by Bauhin Small marsh plants with white flowers.

472. *Velleia.* Named by Sir James Smith, after Major Velley, a gentleman who paid much attention to marine algæ The genus resembles Goodenia in appearance.

473. *Scævola.* So named from *scæva*, the Latin word to express the left hand, the flower having the appearance of being defective of one half of its corolla. An extensive New Holland genus resembling Goodenia.

History, Use, Propagation, Culture,

474 *Caprifolium* A poetical name; signifying goat-leaf, that is to say, a leaf which climbs like a goat. *Chevrefeuille*, Fr, *Geisblatt* or *Baumlilie*, Ger, and *Caprefoglio*, Ital This is a beautiful genus of flowering odoriferous mostly twining shrubs, valuable in the flower garden, shrubbery, and against walls, arbors, or trunks of trees Like most British twiners, the honeysuckle follows the sun Like other twiners, it bears pruning well, for, as Professor Martyn observes, "those plants which in a state of nature cannot ascend without the assistance of others, are often liable to lose large branches, they have therefore a proportionate vigor of growth to restore accidental damages" Against a wall, the climbing kinds are very liable to attacks from aphides, and the caterpillar of Phalœna tortrix, and the sphinges, or hawkmoths, according to Withering, extract the honey from the very bottom of the tubular flowers with their long tongues

In raising the honeysuckle from seeds, they should be sown the autumn after they are ripe, otherwise they will not come up the first year. Cuttings are sometimes apt to rot, owing to water lodging in their tubular stems above the last joint To obviate this inconvenience, some make the cuttings of double the usual length, and insert both ends in the ground, leaving the part above ground in the form of a semicircle Commonly, however, such cuttings root only at one end, or if at both, but very weakly at what was the top end

475 *Lonicera* Named after Adam Lonicer, a German, who was born in 1528, and died in 1586 There was another Lonicer, John, who wrote commentaries upon Dioscorides A section of what was formerly called Lonicera, comprising the species with a shrubby upright stem, neither climbing nor prostrate plants. All hardy and easily increased by layers or cuttings

476 *Symphoria*, is a syncope of *symphoricarpos*, from συν, together, φερω, to bear, and καρπος, fruit, a plant which bears its fruit together in clusters A small genus of low branching shrubs, formerly constituting part of Lonicera.

477 *Diervilla.* Dierville, a French surgeon, travelled in Acadia, whence he sent this plant to his friend Tournefort, who named it after him A pretty low shrub, with yellow flowers appearing in the spring

478. *Trioseteum.* From τρεις, three, and οστον, bone, three bones, on account of its three hard seeds The roots of this genus and of Diervilla are used indiscriminately in N America for Ipecacuana. (*Viola Ipec.*)

479 *Caffea.* An alteration of the Arabic name *qahouh*, which is the name for the liquor of coffee; the grain is called *boun.* *Cahwa*, Pers., *Cahvey*, Turk., and *Eleave*, Egypt

2779 Flowers whorled terminal, Leaves deciduous, the upper perfoliate

2780 Heads term generally 3 together, Lvs decid. pubes opp. upper perfo smooth, lower with stalks only conn
2781 Whorls in heads with bracteæ, Lvs deciduous glaucous beneath, Upper perfoliate, C or gibbous at base

2799 Raceme terminal, Cor bearded inside
2800 Leaves cordate ovate, Berries distinct, Pedunc. axillary 2-flowered shorter than leaf

2801 The only species. Racemes terminal, Leaves serrated

2802 Leaves oval acuminate, Leaves abruptly narrowed at base, Axillæ 1-many-flowered
2803 Stem hispid, Leaves oval-lanceolate somewhat connate, Axillæ 1-flowered

2804 Leaves oblong ovate acuminate, Peduncles axillary aggregate, Cor 5-cleft
2805 Leaves oblong lanceolate acuminate, Panicle few-flowered trifid terminal, Cor 4-cleft

and Miscellaneous Particulars.

C arabica is an erect, conical-shaped, low tree, with a light brown bark, and opposite, oblong, wavy, shining, light green leaves, flowers in clusters at the base of the leaves, white, of a grateful odor, but of short duration, berries green, red when fully grown, and black when ripe A decoction of this berry forms the well known beverage which is said to have been drank in Ethiopia from time immemorial. It was introduced into Arabia from Persia about the middle of the 15th century, and proceeded by Mecca, Medina, and Grand Cairo, Damascus, and Aleppo to Constantinople, where two coffee-houses were opened in 1554 It is thought to have been introduced to Venice soon after 1615 · it was known at Marseilles in 1644, and Thevenot, a French traveller, brought it to Paris in 1657 Till 1660, it was drank by such only as had been accustomed to it in the Levant About the end of the 17th century a coffee-house was opened at Paris, by one Pascal, an Armenian, who, not succeeding, came to London, where coffee had been previously introduced by Daniel Edwards, a Turkey merchant, who brought home with him a Greek servant, Pasqua Roffee, who understood the roasting and making of coffee, and afterwards set up a coffee-shed, which he was enabled in time to turn to a house in the churchyard of St Michael's, Cornhill, In 1688 Ray affirms that London might rival Grand Cairo in the number of its coffee-houses

The coffee-tree was first introduced to Europe through the Dutch, who procured some berries at Mocha to be sown at Batavia, which being done in the year 1690, Governor Witsen presented a plant to the botanic garden of Amsterdam, where it bore fruit and produced many young plants From these the East Indies and most of the gardens of Europe have been furnished Coffee was afterwards cultivated by the Dutch in Surinam in 1718, and by the French in Cayenne and the Mauritius soon afterwards. It was next grown in Martinique, and so spread to the neighbouring islands and to Jamaica in 1730, or earlier The plants are raised from seeds, then transplanted into nursery lines Plantations are made chiefly on hills and the skirts of mountains, and, if possible, where the soil is moist and shaded. The trees are planted from five to ten feet apart, according to the goodness of the soil and situation They produce fruit the next year after planting, and the produce of a good tree is from 1½ to 2 lbs of berries. The berries are gathered when they begin to fall, and in this state their pulpy bark begins to shrivel They are further dried under sheds, and there passed between wooden rollers to separate the husk from the kernel; and afterwards sifted, winnowed, and put into casks for sale In Arabia the plant and berries are much smaller than in the West Indies, and the flavor in

History, Use, Propagation, Culture,

consequence greater, bulk being, in these richer soils and more humid climates, obtained at the expence of flavor In our stoves the coffee-tree is raised from the berry, which must be sown soon after being gathered, otherwise if kept six weeks it loses its vital powers. Cuttings of ripened wood root in sand under a glass in moist heat transplanted, and furnished with plenty of water and pot room, they flower and fruit abundantly.

460 *Chiococca* Snowberry, (χιον, snow, and κοκκος, berry) Its berries are of a bright whiteness

481. *Serissa* A name of Commerson's, the meaning of which is not known. The genus is remarkable for the trifid segments of corolla.

482. *Canthium* From *canti*, the Malabar name of the plant. Spiny rigid plants with small opposite leaves, and solitary, sessile, usually fragrant, white flowers

483 *Psychotria.* From ψυχη, life, in allusion to the powerful medicinal effects of one of the species, P. emetica, or, as others say, from ψυχοτριφον, an ancient name for an herb loving shade The genus consists of a great number of stove plants, nearly all bearing white flowers Some of them are very beautiful on account of their foliage one species, P parasitica, is parasitical upon trees in the West Indies.

484. *Hamellia* In honor of the celebrated Henry Louis Du Hamel Du Monceau, born in 1700, died in 1782, author of numerous works on vegetable physiology The genus consists of handsome shrubs of the West Indies, with tubular yellow or orange-colored flowers

485 *Posoqueria* The Galibis in French Guiana call this plant *aymara-posoqueri.* A fine shrub, with white flowers more than a foot long, and an eatable yellow berry as big as a hen's egg

2806 Leaves ovate acuminate, Racemes subdivided axillary 1-sided nodding

2807 Leaves opposite ovate lanceolate, Stipules spiny, Flowers axillary sessile

2808 Spiny, Flowers sessile hairy
2809 Spiny, Leaves ovate wedge-shaped obtuse, Sepals leafy, Berries crowned

2810 Stipules emarginate, Leaves lanceolate ovate
2811 Stipules ovate persistent, Leaves elliptical acuminate subcoriaceous, Berries ribbed
2812 Stipules stem-clasping retuse, Leaves ovate acuminate succulent veinless, Cymes stalked as long as leaves
2813 Stipules ovate oblong bifid, Raceme terminal compound, Flowers clustered sessile
2814 Stem herbaceous creeping, Leaves cordate stalked
2815 Stipules 2-toothed, Leaves lanceolate ovate acuminate pubescent, Panicles cymose spreading
2816 Stipules connate entire deciduous, Leaves oblong ribbed wavy acuminate
2817 Leaves ellipt. narrowed each way, Panicles term erect lax brachiate shorter than the leaves

2818 Racemes terminal colored, Leaves 3 together villous pubescent
2819 Branches rounded, Leaves ternate oblong hairy on both sides, Flowers corymbose
2820 Racemes terminal and axillary, Cor campanulate ventricose, Leaves ternate
2821 Racemes terminal, Leaves oblong wedge-shaped acuminate smooth, Flowers stalked

2822 Stipules and leaves oblong-acuminate, Corymbs terminal about 6-flowered, Tube of cor much curved

2823 Stem unarmed, Leaves large ovate stalked
2824 Stem spiny, Leaves small nearly sessile

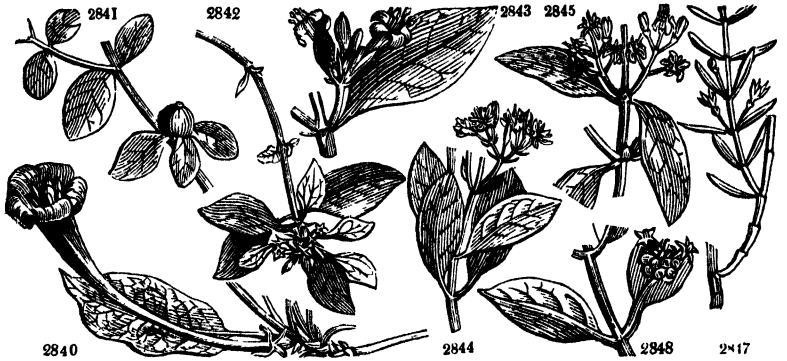
2825 Leaves lanceolate, Cor hypocrateriform, Cal angular, Stem rooting
2826 Leaves elliptical, Cor hypocrateriform, Sepals subulate lanceolate vertical

2827 Leaves elliptical, Cor hypocrateriform, Calyx bursting at side, Sepals dilated at end
2828 Leaves obovate roundish, Cor hypocrateriform, Sepals subulate bluntly keeled
2829 Leaves oblong, Stipules subulate Sepals subulate rounded, Tube smooth dilated short
2830 Branches scarred with two spines at the end, Leaves oblong ovate obtuse, mouth of cor villous
2831 Terminal spines of the branches 4, Sepals linear wedge-shaped, Flowers clustered
2832 Leaves elliptical acute at each end longer than the spines, Flowers sessile smooth
2833 Spines axillary straight shorter than the oval smooth leaf, Flowers terminal solitary
2834 Unarmed, Lvs ovate pubescent beneath, Fls usually hexandrous, Cor hairy on each side, Tube short
2835 A fine species, of which no detailed character has yet been given
2836 Very like G florida, from which it chiefly differs in being smaller with narrower leaves

2837 Leaves oblong lanceolate, Peduncles axillary many-flowered, Tube short
2838 All over hairs, Leaves oblong-obovate, Flowers clustered on the summit, Fruit rounded flat

2839 The only species, with very long white flowers

and Miscellaneous Particulars.



486 *Vanguera* An abbreviation of the Madagascar name of one species, *Voa-vanguer* A fine looking bush, with broad, green, entire leaves. It is said to bear a fine fruit as big as an orange

487 *Gardenia* So named by Ellis, in honor of his friend and correspondent A Garden, M D of Charleston, in Carolina, who sent home many new species of plants. This is a beautiful genus, and most of the species are highly odoriferous, and free flowerers. G florida, on the first approach, smells like the flower of the orange, but on being more closely smelled to, like Narcissus According to Thunberg, there are hedges of it in Japan, and the Japanese are very fond of it near their houses, and in the walks of their gardens The fruit and seeds are used there to dye yellow G Rothmannia smells most during night it bears an ovate, fleshy, angular berry, black when ripe, and about the size of a small pear Almost all the species are spiny in their wild state, but lose their spines at an advanced age, or under high culture and keeping In the stove they require a moist heat to make them flower freely, as do the cuttings to make them strike. According to Sweet, the best way to flower the greenhouse species is to set them in a close frame on a little bottom heat, but not to plunge the pots

488 *Genipa.* A name contrived by Plumier from the name, *Genepapo*, it bears in Guiana and Brazil G americana is an exceedingly rare plant in collections. It bears an excellent fruit, in much request in Dutch Guiana, where it is called Marmalade-box

489 *Oxyanthus* From ὀξυς, acute, and ἀνθος, a flower, on account of the acute segments of the corolla A genus divided from Gardenia, from which it is readily distinguished by the long tube of the flower.

History, Use, Propagation, Culture,

490 *Randia* So named in honor of Isaac Rand, F R S, who published the first catalogue of the Apothecaries' Garden at Chelsea.

491. *Mussænda* A name by which Burmann designates a plant of this genus *V fl Zeyl* t 76 The species are all of singular beauty, and especially distinguished by the large colored segment of the calyx, which is either white or purple, and very remarkable

492 *Pinckneya* So named by Michaux, after some American gentleman of the name of Pinckney, who is now forgotten The genus is nearly the same as Mussænda It thrives best, according to Sweet, when turned out against a south wall, and protected by a mat in frosty weather.

493 *Erithalis* A name given by Pliny to a plant remarkable for the verdure of its foliage, ἐρί, a particle signifying augmentation, and θαλλω, to be green It is now applied to a pretty genus of South American plants

494 *Webera.* In honor of G Henry Weber, a German botanist, who published Flora Gottingensis, in 1778, and other works of merit He is chiefly known for the attention he bestowed upon muscology. Small plants with bunches of white flowers

495 *Plocama.* From πλοκαμος interwined hair, on account of its pendulous twisted branches. A little bush with the habit of some kind of Galium The flowers are very small, and not much longer than the calyx.

496 *Morinda. Morus indica,* Indian mulberry, so named by Vaillant, from the shape and color of its fruit. The bark of the roots of this genus is used in the E Indies to dye yellow.

497. *Cephaelis* From κεφαλη, a head, on account of the flowers being united in heads, remarkable for the large, often colored, involucrum in which they are enveloped Species are very rare in collections, and require a high temperature

498. *Sarcocephalus.* From σαρξ flesh, and κεφαλη, a head, in allusion to the large fleshy fruit of the genus. This is like a pine-apple without its crown, of a dull uniform color, and consisting of a solid fleshy mass containing many minute seeds The flavor is said to be excellent. A plant now common in gardens near London, but it has not yet fruited.

499. *Hirtella.* Derived from *hirtus,* hairy Its branches are covered with fine hair Some of these are tall trees of the tropics, usually supporting themselves upon other plants Flowers, which are generally blue or purple, are rarely seen in this country. Cuttings root in sand under a hand-glass.

2840 Leaves ovate stalked, Spines curved, Flowers in terminal umbelled cymes
2841 Spines of the branches terminal in pairs, Leaves ovate roundish, Cor. hypocrateriform

2842 Branches and leaves pubescent, Tube of corolla much longer than calyx

2843 A large tree with downy long leaves dividing but little into branches

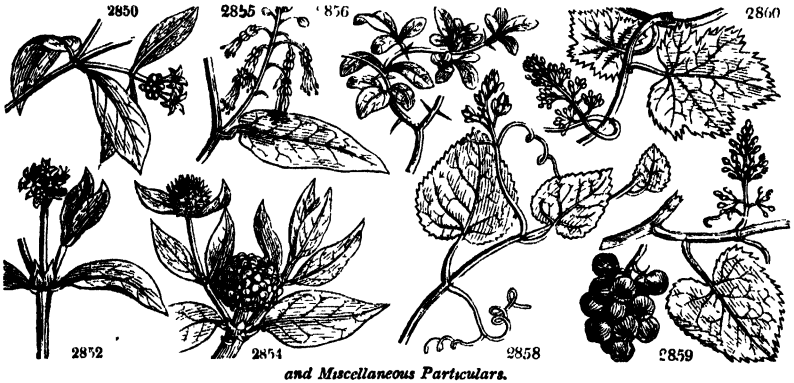
2844 Leaves obovate, Cymes compound stalked terminal

2845 Leaves oblong acute, Corymb terminal
2846 Leaves ovate acuminate, Cymes many-flowered axillary-stalked

2847 A small shrub with the appearance of Galium

2848 Erect, Leaves lanceolate ovate, Flowers clustered
2849 Leaves ovate acuminate smooth on both sides, Flowers solitary
2850 A long trailing plant with ovate entire smooth leaves

2851 Heads globose terminal, Peduncles elongated, Involucre 2 leaved, Leaves smooth
2852 Leaves coriaceous lanceolate smooth, Heads on very long stalks
2853 Heads not in an involucrum so long as the flowers, Leaves lanceolate wavy



2854 The only species

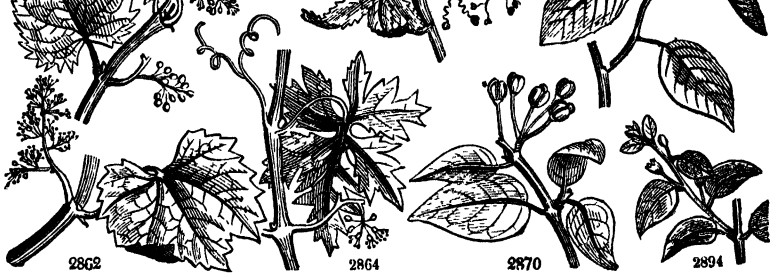
2855 Racemes simple axillary solitary, Common peduncle villous, Leaves oblong, acuminated

2856 Leaves 3-leaved

2857 Leaves sinuated naked
2858 Leaves cordate toothed villous beneath, Tendrils bearing the fruit
2859 Leaves cordate angular 3-lobed toothed, beneath downy clear white

2860 Leaves cordate 3-lobed coarsely toothed smooth, Teeth unequal with long-pointed divisions

and Miscellaneous Particulars.



500. *Triphasia.* A name of Loureiro, derived from τριφασιος, triple, on account of the triple divisions of its flowers, and ternary disposition of its leaves It is the *Limonia trifoliata* of gardens, a common bush, sometimes covered over with the little orange berries, which have an agreeable orange-like taste.

501. *Vitis* From the Celtic *gwyd*, a tree or shrub The *G* being suppressed in the pronunciation, according to the usage of Celtic nations, the Latins have made of it *vitis*, the Spaniards *vid*, the French *vigne*, and the English *vine*. The term *muscat*, applied to particular kinds of grape, is not derived from the perfumed or musky flavor of those varieties, but from the berries attracting flies, *muscæ*, for which reason the Latins called the kind *vitis apiaria*.

V vinifera is universally known for its fruit, and for producing the first liquor in the world; a liquor which, notwithstanding all that is said of its dangerous qualities, is yet eagerly drank by all who can procure it, and preferred before all others by those who are unlimited in their means and choice The grape vine is among fruits what wheat is among the cereal grasses, or the potatoe among the farinaceous roots, and, like them, in every country where it will grow, it is cultivated with pre-eminent care. In Britain, its culture is now confined to the garden as a dessert fruit; though formerly grown in many places for the wine-press. Besides the V vinifera, the V labrusca (from *busca*, the Hebrew for grape) and laciniosa are all cultivated, and both are now so intermingled with the first species by hybrid products, that for all practical purposes they may be considered as only varieties.

The varieties of the grape in countries where it is grown for the wine-press, are almost as numerous as the vineyards; for as these for the most part differ in soil, aspect, elevation, or otherwise, and as the vine is greatly the child of local circumstances, its habits soon become adapted to those in which it is placed. When it is considered that a vineyard once planted will last two or three centuries, it will readily be conceived that the nature of a variety may be totally changed during only a part of that time The varieties most in esteem for wine making, are small berries, and bunches with an austere taste. The Burgundy, as modified by different soils and situations, may be considered the most general vineyard grape of France, from Champagne or Marne to Marseilles and Bourdeaux. The best wine in Italy and Spain is also made from grapes of this description, but in both countries many of the larger berried sorts are grown as being more productive of liquor The sweet vines, as the Malmsey, Madeira, Constantia, Tokay, &c. are made from sweet-berried grapes allowed to remain on the plants till over ripe. That wine is the strongest, and has most flavor, in which both the skins and stones are bruised and fermented. The same thing is the case in making cider; but in both processes bruising the stones or kernels is often neglected.

History, Use, Propagation, Culture,

The varieties of dessert grapes on the continent are few the best they have, as the Muscats and Frontignacs, have been obtained from this country The Chasselas or frame grape (our Muscadine), is almost the only eating grape known in the Paris fruit market In Britain, we have not only the best varieties, but we grow the fruit to a larger size and of a higher flavor than is done any where else in the world This is owing to the perfection of our artificial climates, and the great attention paid to soil and subsoil, and other points of culture.

The vine is universally propagated by cuttings, either a foot or more long, with a portion of two year old wood, or short with only one bud, or one bud and half a joint, &c Varieties without end are raised from seed, and it is thought that by propagating from the seeds of successive generations some sorts may ultimately be procured better adapted for ripening their fruit in the open air than now known A seedling vine carefully treated will show blossoms in its fourth or fifth year, say that it produces a fair specimen of its fruit in the sixth year, then a new generation may be obtained every sixth year.

The vine will thrive in any dry soil, or in any soil with a dry subsoil, but it produces the best flavored fruit among granitic and calcareous fragments, and loamy soil in thin strata, with little manure, and when the vine is old and the berry and bunch small on the contrary, the most luxuriant crops, large bunches and berries, in a good depth of friable loam, dry below and richly manured with the strongest of animal manures.

There are three methods of pruning the vine in hot-houses, the fruit tree method, in which the plant is spread out in the fan manner, and treated like a common fruit tree, the long or young wood method, in which all the wood above a year old is cut out down to the stool or stock; and the spurring-in method, in which the fruit is produced from young wood grown annually from the sides of a main shoot or shoots of old wood. The two last methods are the best

Vitis vulpina, the foxgrape, (so called from the foxy flavor of its berries) is cultivated much in North America, of which country it is a native Many improved varieties have been raised by the American gardeners, and have been sent to Europe under the name of the Bland, the Isabella, the Oswego Tokay, &c. &c , but they are all tainted with the bad taste peculiar to the species, and can be in no estimation when even an early July grape is to be procured

502. Ampelopsis From ἀμπελος, a vine, and ὄψις, resemblance The genus resembles the vine in habit, leaves, and flowers; is commonly employed for covering old walls, for which the rapidity of its growth renders it very suitable

503. Rhamnus. From the Celtic *ram*, signifying branching From this word the Greeks have gained ῥαμνος, the Latins *ramus*, and the French *rame*, or in old French *reim*, for which reason the arms of the

2861 Leaves cordate acuminate nearly equally toothed smooth on both sides, Racemes loosely many-fruited
2862 Leaves unequally cut toothed shortly trifid, Stalk nerves and edge pubescent
2863 Leaves shining on both sides reniform cordate equally toothed, Flowers in many little heads
2864 Leaves quinate, Leaflets many-cleft
2865 Shoots very cæsious, Leaves cordate angular

2866 Leaves cordate acute toothed 3-lobed, Nerves villous beneath, Racemes twin bifid
2867 Leaves bipinnate smooth, Leaflets cut-lobed, Racemes stalked twin bifid
2868 Leaves palmate 3-5-leaved smooth on both sides, Leaflets stalked oblong acuminate
2869 Leaves palmate 3-5-leaved on each side pubescent, Leaflets ovate acuminate coarsely toothed

2870 Flowers monogynous hermaphrodite erect, Caps 3-coccous, Stalks rusty tomentose
2871 Flowers hermaphrodite trigynous axillary in umbels, Leaves elliptical acute entire villous beneath
2872 Spines terminal, Leaves linear-lanceolate serrate acute
2873 Unarmed, Leaves lanc. acute at each end serrated with hairs at the axillæ, Flowers axillary clustered
2874 Spines terminal, Flowers 4-cleft dicœcious, Leaves ovate, Stem erect, Berry 4-seeded
2875 Spines terminal, Flowers 4-cleft dicœcious, Stems procumbent
2876 Spines terminal, Leaves linear entire obtuse
2877 Spines terminal, Leaves oblong entire
2878 Branches spiny, Flowers 4-cleft or trifid dicœcious, Leaves oblong obtuse evergreen
2879 Spines terminal, Flowers 4-cleft hermaphrodite
2880 Spines terminal, Leaves ovate serrulate, Branches divaricating
2881 Leaves ovate entire smooth sessile, Branches square
2882 Unarmed, Leaves lanceolate serrulate acute at each end pubescent beneath
2883 Flowers dicœcious, Leaves ovate-lanceolate glandular crenulate
2884 Creeping, Flowers hermaphrodite, Leaves stalked ovate crenate
2885 Flowers monogynous hermaphrodite, Leaves entire smooth, Berry 2-seeded
2886 Flowers monogynous hermaphrodite, Cal. villous, Leaves elliptical entire acuminate rounded at base
2887 Flowers hermaphrodite racemose, Leaves ovate bluntly serrated smooth at the base glandular
2888 Flowers polygamous, Style triple, Leaves ovate serrated
2889 Flowers hermaphrodite, Stigma triple, Leaves cordate, Branches with tendrils
2890 Flowers hermaphrodite, Leaves oval acuminate serrated veiny beneath
2891 Flowers hermaphrodite, Leaves oblong acuminate scarcely perennial
2892 Flowers dicœcious, Stigma triple, Leaves evergreen elliptical serrated acute at the base obtuse
2893 Flowers dicœcious, Stigma triple, Leaves evergreen lanceolate acute at each end mucronate toothed

2894 Leaves ovate ribbed veiny repand, Flower-stalks one flowered, Stem erect
2895 Dicœcious unarmed, Stem twining, Leaves ovate mucronate repand subcrenate striated

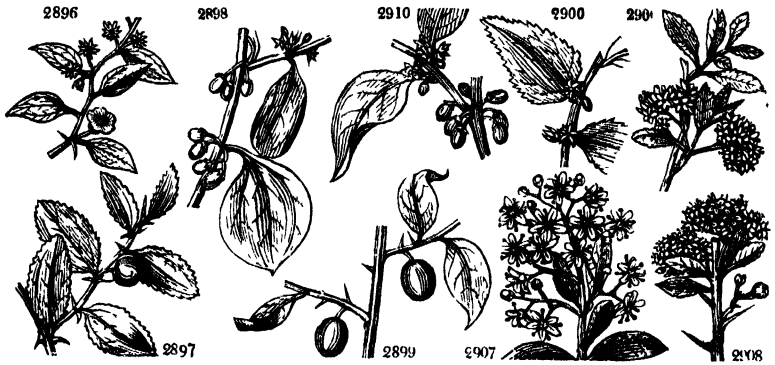
and Miscellaneous Particulars

town of Rheims are two branches intertwined R. catharticus was formerly used in medicine, and is still employed in color-making, and sometimes in dying The juice of the unripe berries has the color of saffron, and is used for staining maps or paper They are sold under the name of French berries, as those of R. Clusii are, under the name of Avignon berries The juice of the French berries when ripe, and mixed with alum, is the sap green of the painters, but if the berries be gathered late in the autumn, the juice is purple The bark affords a beautiful yellow dye The inner bark, like that of elder, is said to be a strong cathartic, and to excite vomiting The berries operate briskly by stool, but occasion thirst and griping. It is said by Woodville that the flesh of birds which feed on them is purgative.

R. lycioides furnishes the wood of which the Monguls make their images, on account of its hardness and orange red color

R saxatilis greatly resembles R catharticus. The berries are used to dye the Maroquin or Morocco leather yellow

R. theezans has leaves like the common tea, which are used as such by the poor of China, and called Tia. (*Osbeck.*)



R. frangula has dark purple berries, which are purgative, like those of the common buckthorn. Gathered before they are ripe they dye wool green and yellow, when ripe, blue-gray, blue, and green The bark dyes yellow, and with preparations of iron, black From a quarter to half an ounce of the inner bark boiled in small beer, is a sharp purge In dropsies or constipations of the bowels in cattle, it is a very certain purgative. The flowers are particularly grateful to bees Goats devour the leaves voraciously, and sheep will eat them. Charcoal prepared from the wood is used by the makers of gunpowder. The berries of this species, and also of the cornus, are said to be brought to market and sold for those of the buckthorn; but they are easily distinguished, the true buckthorn having four seeds, this two, and the cornus one.

R. hybridus is the offspring of R. alpinus and alaternus, first procured by L'Heritier about 1778.

R. alaternus is an ornamental evergreen, with mellifluous blossoms, much frequented by bees. It is sometimes confounded with the Phillyrea, but they may be easily distinguished by the position of their leaves, which are alternate in these, but placed opposite by pairs in that. It is a rapid growing shrub, and useful for thickening screens, clothing walls, &c.

504. *Œnopia.* From *ανοινλυξ*, vinous. Its little fruit, full of juice, resembles the berry of a grape. The Rhamnus volubilis and lineatus belong to this genus, and are beautiful little climbing plants, but rather impatient of cold.

History, Use, Propagation, Culture,

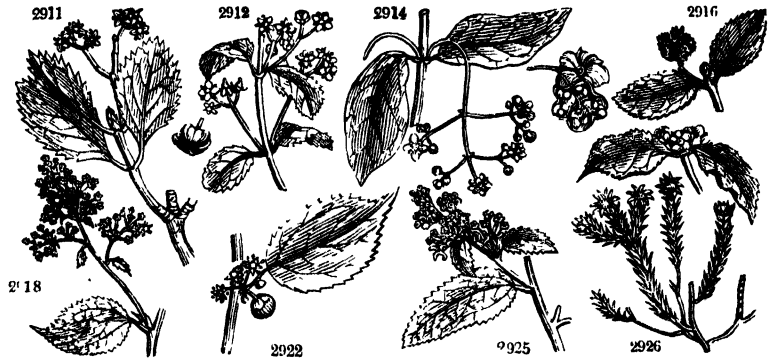
505 *Paliurus* Παλιουρος is the Greek name of a place. The city of Paliurus was situated on the coast of Africa over against Candia Paliurus australis is a handsome free flowering, but very prickly shrub it has broad roundish buckler-shaped seed-vessels, which have borders like the brims of a hat, the footstalks being fastened to the middle From this singular appearance of the fruit, like a head with a broad-brimmed hat on, the French call it *porte chapeau* This shrub is by many persons supposed to be that from which the crown of thorns which was put upon the head of Jesus Christ was composed, the truth of which is supported by many travellers of credit, who affirm that this is one of the most common shrubs in the country of Judea, and from the pliableness of its branches, which may easily be wrought into any figure, it may afford a probability Hasselquist, however, is of opinion, that it was a species of Rhamnus, called therefore by Lannæus R Spina Christi

506. *Zizyphus.* A name altered by the Greeks from *asafifa*, its name in the East. Vide *Shaw's Voyage*, 47. Suppl It is called *Zezoof* in Arabic, *Golus* Z Lotus, is the true Lotus of the Lotophagi. It is a prickly branching shrub, with alternate, small, blunt, three-nerved leaves, solitary flowers, and the fruit a spherical drupe, the size of a wild plum, sweet and harmless, inclosing a small, round, bony, two-celled nucleus; first green, but when ripe tinged with saffron-color It is found on the eastern as well as the western extremity of the African desert, and Major Rennel thinks he has seen it on the Ganges Dr Shaw found the fruit common in all the kingdoms which he visited he describes the fruit as small farinaceous berries, of a very common in Barbary, it was sold in the markets, cattle fed with it, and a liquor drawn from it. Mr. Park found it yellow color and delicious taste The natives, he says, convert them into a sort of bread, by exposing them some days to the sun, and afterwards pounding them gently in a wooden mortar, until the farinaceous part is separated from the stone This meal is then mixed with a little water, and formed into cakes, which, when dried in the sun, resemble in color and flavor the sweetest gingerbread. A gruel is next made from the meal which still adheres to the stones The Greeks supposed the people who ate the lotus to be confined to an extent of sea-coast on the north of Africa, including the gulphs of Syrtes. The plant grows readily in our greenhouses, and might be fruited if thought desirable It is propagated by ripened cuttings planted in sand under a hand-glass.

2896 Prickles stipulary twin, one straight one recurved, Leaves ovate crenulate smooth stalked

2897 Prickles twin, one recurved, Leaves ovate oblong obsoletely crenate
2898 Prickles in pairs recurved, Peduncorym Fls half digynous, Leaves ov. oblique smooth on both sides
2899 Prickles solitary recurved, Leaves rounded ovate obtuse downy beneath, Peduncles aggregate
2900 Prickles in pairs, one recurved, Leaves ovate retuse toothed smooth

2901 Leaves oval acute shining margined smooth, Flowers axillary
2902 Leaves ovate acute, Panicles terminal
2903 Leaves oblong acuminate serrated, Racemes terminal, Stem twining
2904 Leaves ovate acute at each end serrated evergreen, Flowers axillary
2905 Leaves ovate serrated, Branches square
2906 Spines axillary, the larger leafy, Leaves lanceolate obovate serrated obtuse, the younger acute
2907 Spines naked, Branches rounded acute
2908 Spines naked, Branches angular, Leaves obovate serrate toothed, Cymes axillary



2909 Leaves lanceolate stalked wavy at edge, Cymes umbelled terminal, Caps. 2-celled 2-seeded
2910 Leaves elliptical angular nerveless evergreen, Caps 1-seeded

2911 Flowers 4-cleft, Leaves rounded ovate toothed
2912 Flower-stalks compressed 3-flowered, Flower usually tetrandrous, Leaves oblong-lanceolate smooth

2913 Flower-stalks filiform rounded, Leaves ovate acuminate smooth, Branches warted
2914 Flower-stalks filiform rounded many-fl Lvs ovate oblong acuminate, Branches smooth, Petals roundish
2915 Flower-stalks compressed many-flowered, Stigmas square truncated, Lvs obl acuminate pubes beneath
2916 Flower-stalks rounded 3-flowered, Fl pentan Lvs obl lanc smooth subsess acute serr Branches square
2917 Branches square, Leaves subsessile long linear elliptical subfalcate entire, Fruit warted

2918 Leaves ovate oblong acute subcordate serrate 3-nerved beneath soft with hairs, Corymbs contracted
2919 Leaves oblong acuminate mucronate serrulate 3-nerved, Corymbs loose
2920 Leaves obovate serrated pubescent beneath, Panicles on very short stalks, Branches deep red
2921 Decumbent smooth, Leaves very small in bundles oblong entire, Corymbs of the branches terminal
2922 Leaves ovate acuminate veiny, Cymes axillary
2923 Leaves lanceolate obtuse netted with veins, Panicle terminal
2924 Leaves obovate tomentose beneath, Heads of flowers in panicles
2925 Leaves oblong somewhat cordate serrate tomentose beneath, Racemes compound stalked

2926 Leaves lanceolate 3-cornered spreading, Ray of calyx shorter than the head
2927 Leaves linear lanceolate 3-cornered spreading, Ray of calyx longer than the head

and Miscellaneous Particulars

Z jujuba is a middle-sized tree, with ovate leaves, pale yellowish flowers, and red oval fruit, about the size of olives, inclosing a stone of the same shape They are sweet, and eaten in the East Indies and China.

Z vulgaris is a middle-sized branching tree, bearing a saffron-colored drupe shaped like an olive, but smaller. The plant grows wild in Calabria, and is cultivated in other parts of Italy, and in Spain. The fruit is eaten green or dried as a sweatmeat It is common in China, Japan, Syria, &c. and is said to have been first introduced into Italy from the latter country in the time of Augustus. All the species are readily increased by ripened cuttings planted under a hand-glass

507 *Celastrus* From κηλας, the latter season The ancients considered the holly, the Genista, and the Celastros, the trees which ripened their fruit latest. The Celastros of the ancients is thought to have been a kind of Euonymus, to which this genus is nearly allied It consists of shrubs or small trees, with alternate leaves, and numerous small flowers The plants are of easy culture, but of no great beauty

508. *Scnacia* A genus divided by M de Lamarck from *Celastrus*, and founded upon the Celastrus undulatus of L'Heritier

509. *Euonymus* From ευ, well, and ονομα, a name, well named The application of the name is, however, obscure to us Euonymus was also a Heathen divinity, according to Epimenides she was the mother of the Furies by Saturn *Fusain*, or *Bonnet de Prêtre*, Fr, *Spindelbaum*, Ger., and *Fusaggine*, Ital. The species form neat little trees of no great beauty or use E europea is called prick-wood, from the use of the wood formerly as skewers. E. americana best merits culture, and next, E. latifolia They are easily increased by seed or ripened cuttings.

510. *Ceanothus*. Κεανοθος is a name used by Theophrastus to designate a prickly plant, from κεω, to prick. This is a genus of North American plants, one species of which, C. americana, is very common in gardens. The leaves are dried in Carolina and used as tea, and the root to dye wool a Nankeen cinnamon color The species are of the easiest culture, but of very little beauty.

511 *Staavia* Named after Martin Staaf, a correspondent of Linnæus. Little Cape shrubs, with heads of flowers resembling those of some compound plant. Young cuttings in sand, and covered with a bell, soon strike root.

History, Use, Propagation, Culture,

512. *Pomaderris* From πῶμα, a lid, and δέρρις, a skin, on account of the membranous lid with which the cells of the capsule are covered New Holland shrubs, with the habit of Ceanothus, from which they are distinguishable only by their fruit. Cuttings root freely in sand under a hand-glass.

513. *Mangifera* From *Manga* or *Manghos*, the vernacular name of the fruit, and *fero*, to bear. This is a large spreading tree, bearing a fruit in great estimation in the East. The wood is brittle, brown, and used only for indifferent works The leaves are seven or eight inches long, and two or more broad, lanceolate, entire, of a shining green, and sweet resinous smell. The flowers are produced in loose bunches at the ends of the branches The fruit is a berried drupe, large, flattened like a lens, kidney-shaped, the flesh soft and pulpy, like a damascene plum, the shell almost kidney-shaped, of a leathery crustaceous substance, and one-celled. This fruit, when fully ripe, is yellow and reddish, replete with a fine agreeable juice, some are full of fibres, and the juice runs out of these on cutting, or with a little handling, but those which have few or no fibres are much the finest, they cut like an apple, but are more juicy, and some are as big as a large man's fist. It is esteemed a very wholesome fruit, and, except very fine pine-apples, is preferable to any fruit in India, gentlemen there eat little other fruit in the hot months, but if no wine be drank with it, the Mango is apt to throw out troublesome boils, at least with new comers, which are, however, conducive to health. In Europe we have only the unripe fruit brought over in pickle.

Loureiro remarks, that there are many varieties, differing chiefly in the figure, size, color, and taste of the fruit, as apples and pears do in Europe Retzius, on the contrary, affirms, that there are certainly several distinct species; the number of stamens in some being double, the racemes in others compound, the fruit kidney-shaped, globular, fleshy, almost juiceless, &c

According to Sweet, "the Mango ripens fruit in this country, when the plants are of a good size. Sandy loam, or a mixture of loam and peat, is most suitable to it, and the pots should be well drained, as the plants are apt to get sodden with too much water Fresh seeds from the West Indies vegetate freely. The plant may also be increased from cuttings, which root best in sand under a hand-glass" (*Bot Cult.* 77.)

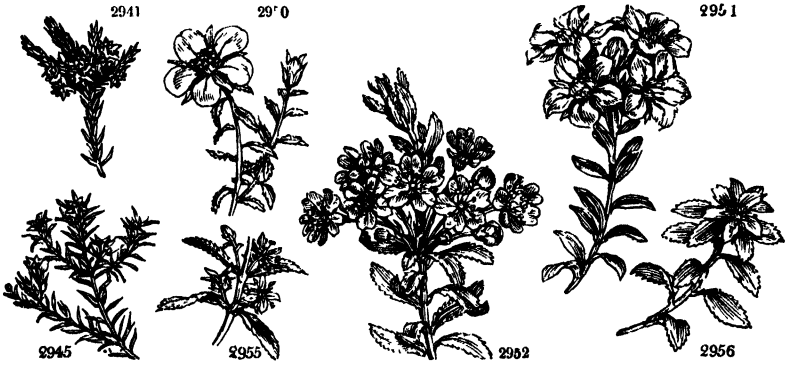
Knight, Hallet, and some other horticulturists are at present cultivating this tree with a view to its fruit. Knight recommends for such trees, training the shoots downwards, and at no great distance from the glass. There are trees in the garden of Earl Powis which must bear very soon.

514. *Schrebera.* Named after John Chr. Daniel Schreber, a German botanist, chiefly known by an edition of

2928 Leaves ovate-oblong doubly-serrated tomentose beneath, Flowers apetalous in racemes
2929 Leaves oval tomentose beneath, Heads of flowers in umbels panicled
2930 Cymes panicled terminal, Leaves ovate lanceolate entire coriaceous rusty beneath
2931 Leaves linear, Flowers in axillary clusters as long as leaves

2932 Leaves lanceolate wavy, Panicles terminal many-flowered, Stamen 1

2933 The only species



2934 Peduncles solitary 1-flowered, Leaves somewhat hairy
2935 Leaves lanceolate linear, Peduncles solitary 1-flowered smooth, Fruit smooth
2936 Leaves smooth, Cor. cylindrical, Peduncles solitary 1-fl. Petals very long rolled inwards at edge
2937 Panicles few-flowered, Leaves somewhat hairy, Anthers connivent

2938 Branches spiny, Leaves ovate obtuse
2939 Leaves lanceolate acute with red veins
2940 Leaves elliptical coriaceous toothletted, Petals and stamens four

2941 Leaves 3-cornered obtuse ciliated, Flowers terminal
2942 Leaves linear obtuse smooth spreading, Flowers terminal solitary
2943 Leaves linear carinate mucronate villous, Peduncles 1-flowered terminal corymbose
2944 Leaves 3-cornered acute dotted ciliated
2945 Leaves 3-cornered obtuse smooth, Flowers terminal solitary
2946 Leaves oblong lanceolate carinate appressed rough at edge, Flower terminal nearly solitary
2947 Leaves linear carinate mucronate ciliated upright, Peduncles 1-2 flowered corymbose terminal
2948 Leaves linear carinate acute thickish fringed upright, Flowers terminal subsessile solitary or 4 together
2949 Leaves 3-cornered villous-hispid imbricated, Flowers in spiked heads

2950 Leaves lanceolate smooth, Flowers terminal solitary, Calyxes fringed
2951 Leaves oblong smooth ciliated, Flowers terminal in umbels, Calyxes smooth
2952 Leaves ovate oblong glandular scattered, Peduncle glutinous aggregate terminal twice as long as leaves
2953 Leaves linear carinate mucronate at the edge cartilaginous and rough, Flowers axillary and solitary
2954 Leaves cordate, Lower ovate, Upper lanceolate, Umbels terminal

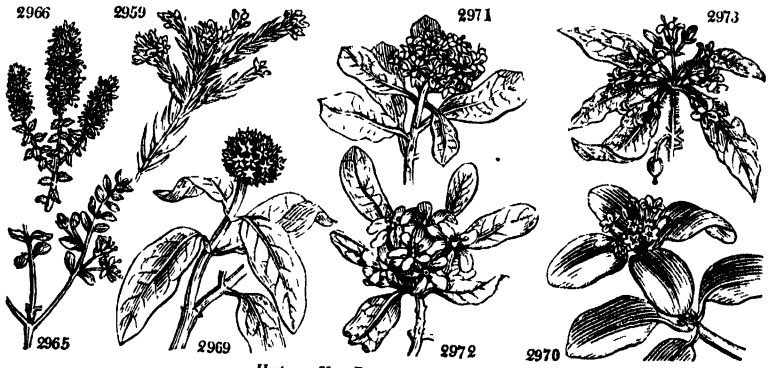
2955 Leaves linear lanceolate serrulate
2956 Leaves ovate crenate pubescent, Peduncles lateral 1-flowered, Branches downy

and Miscellaneous Particulars.

Linnæus's Genera Plantarum, which he published in 1789, in which he unadvisedly altered all the names of Aublet, without ever having seen the plants.

515 *Billardiera* Named in honor of Jacques Julien Labillardière, a French botanist, who visited Syria, and afterwards New Holland, in D'Entrecasteaux's expedition His reputation as a botanist was almost annihilated by the Prodromus Novæ Hollandiæ of Brown The species of this genus are desirable as climbers for a conservatory, especially B longiflora, which is a fast grower and an abundant flowerer, and when in fruit, its fine blue berries make a handsome appearance They thrive well in an equal portion of loam and peat, and cuttings root readily in sand under a bell-glass they may also be raised from seeds, which are produced in abundance (*Bot Cult* 149)

516 *Elæodendrum* From ελαια, an olive, and δενδρον, a tree, a tree resembling an olive E argam furnishes an oil by expression from the fruit as in the common olive: it is used at table by the Moors, and in various works by Europeans. The tree is rather tender, and requires protection during winter



E. australe, and the stove species, "grow freely in a mixture of loam and peat, and ripened cuttings will soon root in sand under a hand-glass" (*Sweet*)

517 *Diosma.* From διος, divine, and οσμη, smell; that is to say, a smell divine among the Hottentots, who rub their greasy bodies with the powdered leaves of all the species, which they call *Bucku.* To Europeans the smell is unpleasant. This is a genus of handsome shrubs, bearing a general resemblance to heaths, but with larger leaves. The flowers are in corymbs at the ends of the branches D. ericoides, and other species, are the kinds chiefly used by the Hottentots to scent the ointments with which they anoint their skin. Young cuttings root freely in sand under a bell-glass

518. *Adenandra* From αδην, a gland, and ανηρ ανδρος, a male; or, in composition of botanical names, a stamen, on account of the appendage of the stamens This is a very natural genus, easily recognized by its glandular anthers. Sweet "found it succeed best in sandy peat, but some prefer mixing a little sandy loam with it. The young tender tops strike best, made into cuttings, and planted in a pot of sand under a bell-glass: it does not require to be plunged in heat." (*Bot. Cult.* 127.)

519 *Baryosma.* From βαρυς, strong, and οσμη, smell, in allusion to its fetid leaves. Plants with the habit of Diosma. Cuttings root readily, taken off in ripened wood, and planted in sand under a bell-glass.

History, Use, Propagation, Culture,

520. *Agathosma.* From αγαθος, good, and οσμη, smell, to be understood as Diosma. This genus resembles that, and requires the same culture. The Hottentots use the leaves of A pulchella dried and powdered, under the name of *Bucku*, to mix with the grease with which they anoint themselves It gives them so rank an odor, that Thunberg says, he sometimes could not bear the smell of the men who drove his waggon

521. *Nauclea.* A noble genus of Rubiaceous plants, bearing their flowers in round heads The meaning of the name is nowhere explained. One species, N Gambir, is said to yield the gamboge gum of the shops

522. *Pittosporum* From πιττα, resin, and σπορος, a seed. The capsule is resinous These are handsome shrubs, with good foliage and pretty flowers P tobira, a native of Japan, is nearly hardy. Ripened cuttings root freely in sand under a hand-glass, or one species may be grafted on another

523 *Lasiopetalum* From λασιος, woolly, and πεταλον, a petal; in allusion to the flowers. Ripened cuttings planted in sand under a hand-glass will root freely

524. *Thomasia.* Named by M. Gay, after M Thomas, an industrious collector of Swiss plants. Divided lately from Lasiopetalum.

525. *Seringia.* Also named by M Gay, in honor of M. Seringe, an ingenious Swiss botanist, author of Melanges de Botanique, and other useful works Divided from Lasiopetalum, with which it agrees in habit and appearance.

526. *Büttneria.* David Sigismond Augustus Büttner, was a professor of botany at Gottingen, who published,

2957 Leaves 3-cornered blunt villous hispid spreading, Umbels terminal
2958 Leaves lanceolate carinated ciliated, Umbels terminal
2959 Lvs. aggregate linear lanceolate channelled glandular villous imbricated, Heads of branches terminal
2960 Leaves aggregate ovate acuminate imbricated dotted fringed, Heads of branches terminal umbelled
2961 Leaves alternate aggregate subcordate acuminate pubesc. dotted, Flowers in terminal umbelled branches
2962 Leaves imbricate spreading lanceolate ciliated, Heads terminal, Five stamens sterile
2963 Leaves aggregate oval obtuse glandular ciliated spreading, Heads of branches terminal
2964 Leaves ovate crenate dotted beneath, Flowers axillary solitary
2965 Leaves opposite smooth ovate entire revolute at edge beneath rusty with dots
2966 Leaves ovate glandular-crenate smooth, Flowers axillary in pairs
2967 Leaves 3-cornered mucronate smooth below dotted in two rows, Segments of calyx smooth
2968 Leaves ovate carinate ciliated imbricated 4 ways, Flowers terminal solitary

2969 Leaves oblong acute, Peduncles equal, Stamens the length of corolla

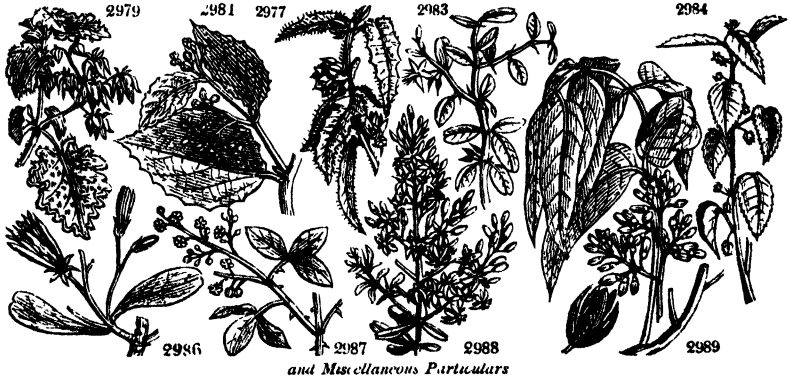
2970 Leaves obovate obtuse smooth coriaceous, Capsules 2-valved
2971 Leaves obovate blunt shining netted beneath, Panicle globose terminal
2972 Leaves obovate obtuse smooth coriaceous, Capsules 3-valved
2973 Leaves oval lanceolate narrowed at each end and stalks smooth, Peduncles of the branches terminal
2974 Leaves elliptical obtuse pubescent beneath revolute at the edge
2975 Leaves elliptical acuminate smooth, Leafstalks rusty with down

2976 Sepals smooth inside
2977 Sepals hoary on both sides

2978 Leaves linear elliptical entire, Stipules leafy, Petals 5, Stamens
2979 Petals 5, Stamens 10
2980 Leaves 3-lobed beneath hispid downy, Petals 0

2981 Leaves ovate lanceolate coarsely toothed

2982 Leaves lanceolate toothed hastate at base, Rachis stem and leafstalks angular prickly
2983 Leaves elliptical entire emarginate, Prickles stipulary, Branches wavy smooth



2984 Leaves cordate smooth
2985 Leaves ovate entire smooth, Ovary stalked, Nectary 10 cleft rayed

2986 Leaves ovate obtuse entire with parallel veins, Flowers terminal panicled

2987 Stem branches and leaves prickly, Leaflets ovate lanceolate subserrated

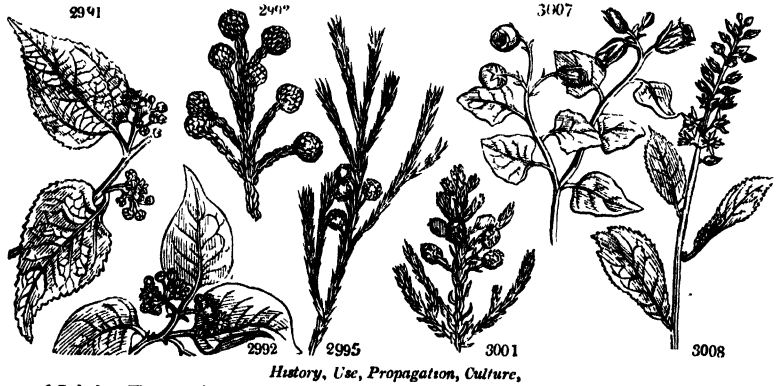
2988 Stem spiny, Leaves emarginate, Flowers racemose

2989 Cal. and cor naked
2990 Cal and cor fringed

and Miscellaneous Particulars

in 1750, a catalogue of the plants in the garden of an amateur named Cunon. Ripened cuttings planted in sand under a hand-glass will root freely.

527 *Ayensa.* In honor of the Duke D'Ayen, of the house of Noailles. He was a great patron of botany. Cuttings root freely in sand in a moist heat.



528 *Calodendrum.* From καλος, fine, and δενδρον, a tree. Fine indeed, with its beautiful foliage and splendid flowers. This is a Cape genus, and is generally supposed to be one of the finest trees known there, its fruit bears great resemblance to a chestnut, but seldom arrives here perfect. It grows freely in an equal mixture of loam and peat; and ripened cuttings root readily in pots of sand under a hand-glass. (*Bot Cult* 159.)

529. *Toddalia.* Kaka Toddali is the Malabar name of the shrub. Cuttings root readily in sand under a bell-glass

530 *Bursaria* From *bursa*, a pouch; the capsules resemble those of Thlaspi Bursa Pastoris so much, that Labillardiere fancied he had found a cruciferous tree when he discovered the plant in New Holland. "This is a pretty plant. It is very desirable for a greenhouse or conservatory, being an abundant flowerer, and very showy when covered all over with its elegant little white flowers, an equal mixture of sandy loam and peat is the best soil for it; and young cuttings are not difficult to root in sand under a bell-glass." (*Bot. Cult* 155.)

531 *Cedrela.* From *cedrus*, the cedar-tree The wood of plants of this genus is one of the kinds of cedar of commerce. All that comes from New Holland in the form of packing cases, is supposed to be the wood of a spe-

History, Use, Propagation, Culture,

cies of Cedrela This tree shoots out many side branches towards the top, which are furnished with winged leaves, composed of 16 or 18 pair of leaflets, so that they are sometimes near three feet long The flowers are on a branching raceme, and the fruit a woody capsule about the size of a pigeon's egg The bark, leaves, and fruit have, when fresh, a smell like assafœtida, but the timber has a pleasant smell In the British West India islands the tree has the common name of cedar The trunk is so large as to be hollowed out into canoes and periaguas, for which purpose it is extremely well adapted, the wood being soft, it may be cut out with great facility, and being light, it will carry a great weight on the water There are canoes in the West Indies which have been formed out of these trunks forty feet long and six broad the wood is of a brown color, and has a fragrant odor, whence the title of cedar has been given to it. It is frequently cut into shingles for covering houses, and is found very durable, but as the worms are apt to eat this wood, it is not proper for building ships, though it is often used for that purpose, as also for sheathing of ships It is often used for wainscoting of rooms, and to make chests, because vermin do not so frequently breed in it, as in many other sorts of wood, this having a very bitter taste, which is communicated to whatever is put into the chests, especially when the wood is fresh, for which reason it is never made into casks, because spirituous liquors will dissolve part of the resin, and thereby acquire a very bitter taste Cuttings of Cedrela strike root under a hand-glass in sand.

532. *Hovenia* Named after David Hoven, a Dutch commissary in Japan, who gave facilities and encouragement to Thunberg while in that country A small tree, nearly hardy Its fruit is eaten in China and Japan, and is said to resemble a Bergamot pear in taste

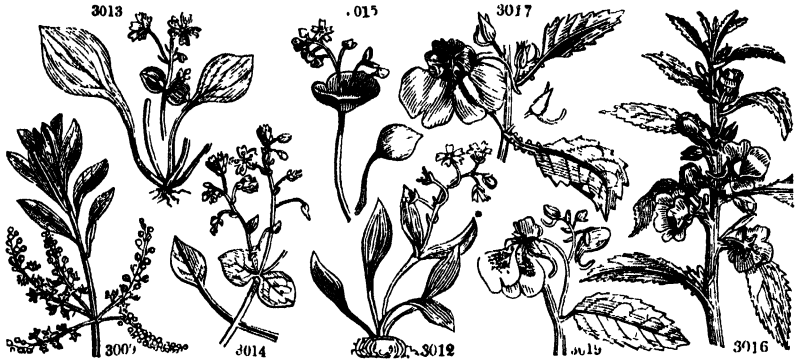
533. *Brunia* So named after Cornelius Brun, a traveller into the Levant and Russia at the end of the last and beginning of the present century This, Sweet observes, "is a pretty Cape genus, its species are pretty bushy shrubs, with heath-like leaves, and are handsomest while young The flowers are not so showy as in many other genera, but some of them are very elegant A sandy peat soil suits them best, with a moderate supply of water, and young cuttings planted in sand under a bell-glass will strike root freely" (*Bot Cult* 153)

534. *Brossæa.* Gui de la Brosse was physician to Louis XIII, and in 1626 procured the establishment at Paris of the Jardin des Plantes, of which he was the first director A very doubtful plant It is said to be a shrub like a Cistus, with scarlet flowers half an inch long

535. *Itea.* From *Itea*, the Greek name of the willow The name Salix having been given to the modern willow, that of Itea has been applied to a plant resembling the willow in leaves and place of growth. This is a handsome plant which thrives well either in peat-soil or sandy loam, and is increased by layers

2991 Fruit sweet fleshy, Leaves glabrous a little shining
2992 Fruit austere, Leaves downy quite opaque

2993 Leaves 3-cornered incurved acute, Flowers terminal on the lateral branches
2994 Leaves 3-cornered brown at end, Chaff of the heads exserted colored
2995 Leaves half round erect-spreading withered at end at the base and branches hairy, Heads round lateral
2996 Leaves 3-cornered obtuse smooth, Heads terminal, Branches whorled clustered
2997 Leaves 3-cornered black at the end smooth, Heads terminal
2998 Leaves ovate 3-cornered fleshy smooth, Heads terminal, Branches divaricating
2999 Leaves 3-cornered and spiked, Flowers smooth
3000 Leaves 3-cornered acute smooth, Heads lateral globose smooth
3001 Leaves linear-lanceolate reflexed spreading their edge fringed at base, Heads terminal corymbose
3002 Leaves half rounded spreading incurved hairy at the end with a withered beard
3003 Leaves 3-cornered appressed ciliated at edge
3004 Leaves ovate acuminate ciliated A very doubtful species
3005 Leaves short acute 3-cornered at the end spreading fuscous and callous, Heads round at end of branches
3006 Leaves ovate convex imbricated, Heads terminal hairy



3007 A little shrub like a Cistus, with ovate stalked alternate pale-green leaves

3008 Leaves ovate acute serrated, Spikes pubescent

3009 Leaves wedge-lanceolate acute membranous nerved, Spikes slender

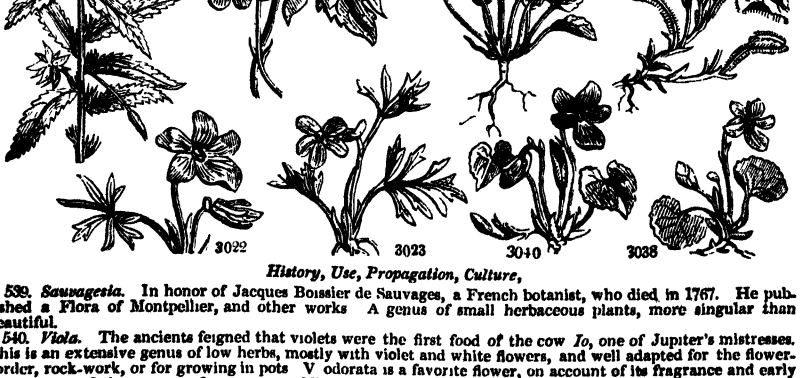
3010 Leaves very long linear, Petals entire
3011 Leaves short oval abruptly narrowed into the stalk
3012 Leaves lanceolate, Raceme solitary elongated, Root tuberous
3013 Leaves nerved . radical and cauline ovate, Raceme 1-sided, Petals bifid
3014 Radical leaves spatulate ovate · cauline ovate distinct, Root fibrous
3015 Radical leaves spatulate rhomb-shaped . cauline perfoliate

3016 Flower-stalks clustered, Leaves lanceolate : the upper alternate, Spur shorter than flower
3017 Leaves alternate oblong oval serrated, Leafstalks with many glands, Spur incurved as long as flower
3018 Flower-stalks generally 2-flowered, Leaves ovate serrated, Flowers orange-brown spotted inside
3019 Flower-stalks clustered, Leaves ovate, Points of stem tumid

and Miscellaneous Particulars.

536 *Cyrilla.* In honor of Dominico Cyrilli, professor of medicine at Naples, and a fellow of the Royal Society of London He published, in 1788, a work upon the rare plants of Naples, which is now one of the scarcest of botanical works. This is a pretty shrub Young cuttings will root under a bell-glass in sand, but not very freely

537 *Claytonia* In memory of Mr John Clayton, who collected plants chiefly in Virginia, and sent them to Gronovius, who published them in his Flora Virginica. C perfoliata is very hardy, and is not easily eradicated where once introduced. It grows on the poorest soil, vegetates early, and the whole of the herbage gathered and boiled makes a very tender spinage.



538 *Impatiens* A metaphorical name given to these plants on account of the elastic force with which their capsules burst, and scatter their seeds upon the slightest touch I. Balsamina is one of the most beautiful of popular annuals, forming a shewy cone of finely variegated carnation-like flowers. The prevailing colors of the petals are red and white, the former extending to every shade of orange, purple, scarlet, lilac, pink, and especially carnation or flesh color Those are esteemed the most beautiful varieties which have the flowers double, and striped in the manner of a flake or bizarre carnation but none of the varieties are permanent or can be continued by seeds, and the plant does not root readily by cuttings. The way to procure very large plants is to sow early in the season, as in March, to commence transplanting into 3-inch pots as soon as the plants have two proper leaves, and to shift every week or ten days into pots a size larger every time, till at last they are in pots of the largest or of a very large size, and in the richest light mould The plants should be kept all the time in a hot-bed or pit, plunged, and with abundance of room and air, and the heat of the melon or pine. Fairweather, by transplanting only three or four times from No 48 pots to those of eight inches diameter raised, produced balsams "four feet high, and fifteen feet in circumference, with strong thick stems, furnished with side branches from bottom to top, and these covered with large double flowers" (*Hort Trans* iii 406.)

The juice of the balsam, prepared with alum, is used by the Japanese to dye their nails red (*Thunberg*)

I Nolitangere, *Ne me touchez pas*, Fr , *Springsame*, Ger , and *Erba Impatienta*, Ital , is the only species found wild in Europe When the seeds are ripe, upon touching the capsules, they are thrown out with considerable force hence the names Impatiens and Nolitangere. In the day-time the leaves are expanded, but at night they hang pendent, contrary to what is observed in plants, which from a deficiency of moisture, or a too great perspiration from heat, commonly droop their leaves during the day. Only the goat is said to eat this plant.

I. biflora, the American Noli-me-tangere, resembles this plant, but is handsomer

History, Use, Propagation, Culture,

539. *Sauvagesia.* In honor of Jacques Boissier de Sauvages, a French botanist, who died in 1767. He published a Flora of Montpellier, and other works A genus of small herbaceous plants, more singular than beautiful.

540. *Viola.* The ancients feigned that violets were the first food of the cow *Io*, one of Jupiter's mistresses. This is an extensive genus of low herbs, mostly with violet and white flowers, and well adapted for the flower-border, rock-work, or for growing in pots V odorata is a favorite flower, on account of its fragrance and early appearance. It is a native of every part of Europe, in woods, amongst bushes, in hedges, and on warm banks.

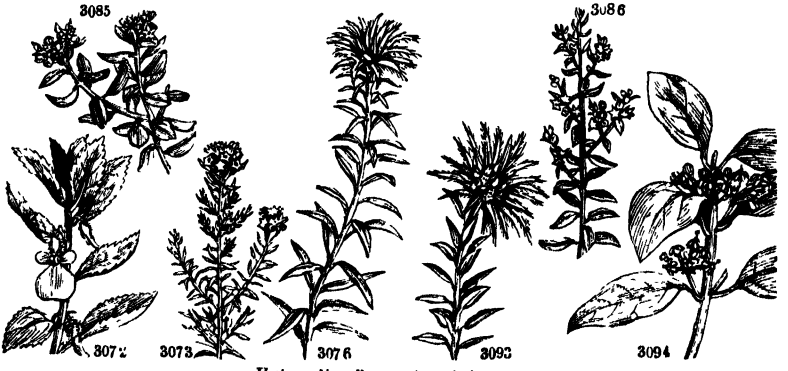
3020 Stem simple, Leaves narrow lanceolate, Stipules very long

§ 1 *Stemless, Stipules membranous*
3021 Pubescent, Leaves palmated 5-lobed toothed and undivided
3022 Leaves pedate 7-parted
3023 Leaves many-cleft, Segments lobed
3024 Leaves obl acute cord. sagittate serr cut at base, Flowers inverted, Three lower petals bearded at base
3025 Smooth, Leaves shining lanceolate obsoletely toothed or crenulate, Flowers whitish [middle
3026 Smth Lvs cord ac cren serr flattish, Fls erect, Pet obliquely turned lateral longer bearded below the
3027 Smooth, Leaves cordate serrate smooth hooded at base, Petals obliquely turned lateral bearded
3028 Leaves cordate crenated pubesc beneath, Lower petal bearded at base, Flower-stalks shorter than leaves
3029 Lvs triang cord. ac cren somewhat hood Pet obov · 3 low beard below mid connv · 2 upper reflexed
3030 Leaves oblong cordate obtuse crenate naked at the base with unequal inflexed hooded lobes
3031 Stemless, Leaves cordate smooth, Peduncles bracted above the middle
3032 Smoothish, Lvs roundish obt. at base cord cren serrate, Runners flowering, Pet lin not longer than cal.
3033 Leaves cordate obtuse acutish flat smooth, Petals not bearded, Flower-stalks as long as leaves
3034 Leaves oblong subcordate, Stalks membranous
3035 Leaves cordate and stalks hispid with hairs, Cal obtuse
3036 Subhirsute, Runners none, Leaves cordate, Calyxes obtuse, Flowers sweet-scented
3037 Leaves cordate vertilinear at base pubescent, Runners none
3038 Leaves reniform smooth, Root creeping, Calyx obtuse
3039 Leaves cordate acuminate subcrenate smooth, Bractes close under the flower, Lower petal truncate
3040 Creeping runners and stalks smoothish, Cal obtuse

3041 Nearly stemless, Leaves roundish elliptical crenate stalked, Stipules lin. serrated, Spur as long as calyx

§ 2 *Caulescent, Stipules membranous*
3042 Old stem ascending, Leaves oblong cordate obt dotted, Stipules setaceous toothed, Cal lanceolate acute
3043 Stem square erect, Radical leaves cordate reniform, Flower-stalks longer than the leaves
3044 Stem erect angular, Lvs cord toothed crenat smooth, Stip tooth on one side, Bract above midd of stalk
3045 Stem spread compressed, Lower lvs cord ovate upper ovate-lanceol. crenul Stip toothed on each side
3046 Stem ascending rounded, Leaves ovate lanceolate, Stipules cut serrated
3047 Stem erect, Leaves cordate oblong, Stipules toothed on one side, Anthers free
3048 Pubescent, Stem simple erect, Leaves ovate obl acute, Petals lanc entire, Flower-stalks length of leaves
3049 Caulescent weak, Stipules membranous lanceolate slightly torn, Leaves shortly cordate toothed
3050 Stems erect and procumbent, Leaves oblong entire sinuated ciliated hispid, Stipules undiv Calyxes acute
3051 Stems filiform undiv. procumb. Leaves ovate stalked their edge at the base ciliated, Stipules undivided
3052 Smoothish, Leaves subcordate acuminate serrated, Flower-stalks length of leaves, Stipules short entire
3053 Leaves cordate acuminate serrated flattish, Stipules lanceolate serrated ciliated
3054 Villous pubescent, Stem erect leafy at top, Leaves broad cordate, Stipules oblong serrated at end
3055 Erect, Leaves broad lanceolate, Stipules linear lanc entire, Flower-stalks axillary in pairs very short
3056 Stem erect and leaf-stks 3-corner Rad fl with cor but sterile caul apet fertile, Lvs reniform cord. cren.
3057 Stem weak about 2-flowered, Leaves reniform serrate, Calyxes acute, Stipules entire
3058 Stem 1-flowered, Leaves cordate toothed
3059 Leaves linear lanc toothed, Stipules linear entire, Spur very obtuse much shorter than calyx

§ 3 *Stipules pinnatifid, Stigma cup-shaped.*
3060 Stem ang diffuse, Leaves oblong toothed crenate, Stipules lyrate pinnat Cor twice as long as smooth cal.
3061 Stem ang dec diffuse, Lower lvs cord upper ovate obl toothed cren Cor scarcely longer than smooth cal.
3062 Stem angular decumb diffuse, Leaves ovate oblong toothed crenate, Cor scarcely longer than hairy cal.
3063 Caulesc smooth, Leaves thickish ovate and oval cren Flowers inverted wavy, Petals rounded broad renif
3064 Stem angular diffuse and leaves oblong serrated hairy, Stipules lyrate pinnatifid, Cor twice as long as cal.
3065 Stem 3-cornered simple, Lvs obl toothed, Stipules palm many-cleft, Petals crenate, Spur as long as cal.
3066 Stem 3-cornered simple, Leaves ovate oblong crenated ciliated, Stipules palmate cut
3067 Stem 3-cornered simple, Leaves oblong, Stipules pinnatifid
3068 Stem very short erect, Leaves roundish crenate, Stipules entire, Flower-stalks 3-cornered



and Miscellaneous Particulars.

Desfontaines says it is frequent about Cassa and Tozzer, in Barbary, in the palm groves; the blue and white growing promiscuously and flowering in winter Hasselquist found it in Palestine, Thunberg in Japan, and Loureiro in China, near Canton. The double purple and the Neapolitan are the most esteemed varieties. the latter forces well, and where there is a stove or warm pit, may be had from Christmas to April, when others are in flower in the open air

In medicine, the flowers of violets act as a laxative, and the syrup is used by chemists to detect an acid or an alkali: for this purpose the V. odorata is cultivated to some extent at Stratford upon Avon. (*Withering*)

History, Use, Propagation, Culture.

V hirta and canina bear a considerable resemblance to V odorata, but the first may be distinguished by its hairy petioles, and the last by its flowers being inodorous

V arborescens is readily propagated by young cuttings planted under a hand-glass.

541. Ionidium. From *ἰον*, a violet, and *εἶδος*, similar, on account of its resemblance to a violet, from which it is by some thought not to be generically distinct

542 Phylica, in Greek *φιλυκη*, and should therefore be written *Philyca* The plant of the ancients is not known. Some think it was the Holly P ericoides occupies large tracts of ground about Lisbon, in the same manner as heath occupies many lands in England Young cuttings of all the species root readily in sand under a bell-glass.

543. Plectronia From *πλεκτρον*, a spur The tree is furnished with stiff spines like the spurs of a cock.

544. Conocarpus From *κωνος*, a cone, and *καρπος*, a fruit its fruit resembles the cone of an alder. Tropical trees, with alternate entire leaves and small heads of yellowish flowers.

545. Cyphia. From *κυφος*, curved, on account of its curved stigma. Small Cape plants resembling Lobelia.

3069 Stem short, Spur subulate longer than petals, Leaves somewhat ovate, Stipules toothed
3070 Stem ascending 3-cornered, Leaves cordate crenate, Spur subulate longer than calyx, Upper petal acum.

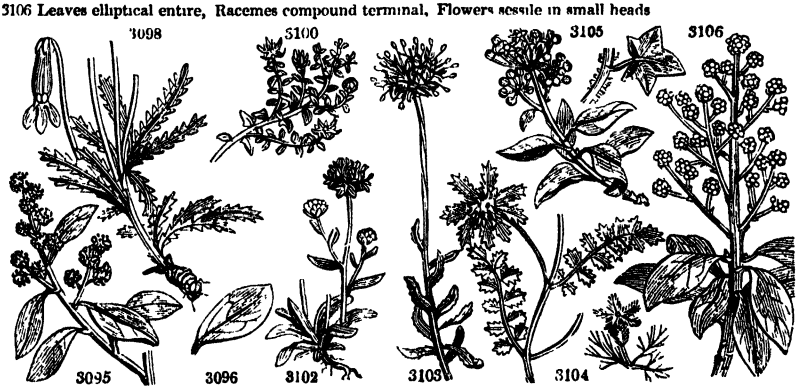
3071 Stem ascending, Leaves opposite sessile and stipules lanceolate, Flowers nodding longer than leaves
3072 Leaves ovate obl. Pedunc. axillary solitary drooping, Lower lip very large emarginate

3073 Leaves linear lanceolate obtuse revolute at edge smooth, Branches umbelled, Heads round downy
3074 Leaves subulate acute rough somewhat hairy, Branches panicled many-flowered
3075 Leaves scattered linear lanceolate hoary beneath, Heads terminal hairy
3076 Leaves linear lanceolate villous, Bractes woolly, Heads terminal
3077 Leaves linear lanceolate acute spreading villous hoary beneath, Bractes colored villous very long
3078 Leaves linear hairy tomentose beneath revolute at edge, Heads terminal, Flowers downy
3079 Leaves linear flattish hoary beneath erect, Heads ovate downy
3080 Leaves linear lanceolate revolute at edge hoary beneath, Flowers axillary solitary racemose
3081 Leaves linear subulate very villous, Flowers terminal axillary, Cor. spreading
3082 Leaves linear upper villous, Flowers racemose
3083 Leaves linear revolute at edge rough hoary beneath, Stipules filiform colored, Bractes bifid naked
3084 Leaves cordate ovate spreading, Stem proliferous
3085 Leaves ovate scattered opposite and three together beneath netted veiny tomentose
3086 Leaves oblong cordate acuminate beneath hoary, Spikes cylindrical, Flowers length of bractes
3087 Leaves ovate mucronate smooth above and shining beneath hoary, Racemes leafy panicled
3088 Leaves oblong cordate acuminate hairy beneath white, Flowers in heads
3089 Leaves cordate ovate smooth, Flowers racemose
3090 Leaves linear lanc revolute at edge villous hairy beneath, Flowers cylind. Bractes as long as flowers
3091 Leaves ovate smooth, Flowers simple panicled racemose
3092 Leaves acerose flat on each side very smooth, Flowers panicled racemose
3093 Leaves linear ciliated arcuate spreading, Head terminal

3094 Branches square, Leaves opposite stalked lanceolate ovate entire smooth

3095 Erect, Leaves lanceolate
3096 Procumbent, Leaves obovate

3097 Leaves entire and toothed linear, Stem twining
3098 Leaves digitate, Leaflets pinnatifid, Stem erect
3099 Leaves oblong crenated ciliated, Scape erect



3100 Leaves and petals lanceolate
3101 Leaves subulate, Petals linear

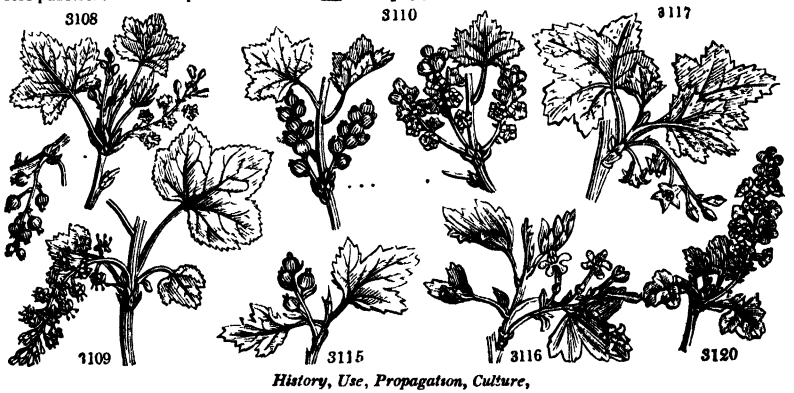
3102 Leaves linear lanceolate narrow at the base hispid wavy curled
3103 Leaves linear smoothish flat obtuse

3104 The only species

3105 Leaves ovate 3-5-angular and 3-5-lobed floral ovate acuminate veiny, Umbels erect

3106 Leaves elliptical entire, Racemes compound terminal, Flowers sessile in small heads

and Miscellaneous Particulars.



546 *Lightfootia* Named after the Rev John Lightfoot, an English clergyman, and author of the first Flora Scotica. The genus is very nearly related to Campanula, from which it is by some thought not different.

547 *Jasione* A name applied by Pliny to an eatable plant J. montana so resembles Scabiosa, as to be often mistaken for a plant of that genus. Linnæus gives a curious account of the process of fecundation in this plant, from which may be observed its affinity to Syngenesia, where it was first placed.

548 *Lagœcia.* From λαγως, a hare, and οικος, a residence The little seeds enveloped in the downy involucrum have been likened to young leverets in a hare's form. The seeds should be sown in autumn soon after they are ripe, otherwise, if this is deferred till spring, they commonly remain a year, and sometimes two or three years, before they grow.

549. *Hedera* A name for which many etymologies have been offered The best explanation is, that it has been derived from *hedra*, cord, in Celtic. *Lierre*, Fr. H. helix is a valuable ornamental evergreen for covering naked buildings or trees, for training into fanciful shapes, as of human figures, &c on skeletons of wire-work, or trained up a stake so as to form a standard. Flowering so late in the season, it is much resorted to by

History, Use, Propagation, Culture,

bees and flies, when little other food is to be had The berries increase during the winter, are full formed in February, and ripen in April, furnishing food for wild pigeons, blackbirds, thrushes, &c. in the spring Blackbirds, and several other birds, build their nests in the stumps of ivy tufts Sheep are fond of the leaves, especially during severe weather The ancients held ivy in great esteem, and Bacchus is represented crowned with it to prevent intoxication

H Helix vegeta, the giant or Irish ivy, perhaps a distinct species, is a native of the island of Madeira.

550 *Ribes* The name of an acid plant mentioned by the Arab physicians, and supposed to be the plant now called Rheum Ribes R grossularia is so called because its berries resemble little half-ripe figs,—*grossi*. This is a genus of well known shrubs, some of them much cultivated for their fruit R rubrum, the common red currant, is the *Groseilles en grappes*, or *Groseilles d'outre mer*, Fr., *Gemeine Johannisbeere*, Ger, and *Uvetta*, Ital The English name currant is evidently from the similitude of the fruit to that of the grape of Zante, which dried forms the corinths or currants of the shops The fruit has an agreeable sub-acid taste, and is generally relished both at the dessert and in pies and tarts Equal weights of fruit and pure sugar, put over the fire, yield a liquor which forms a most agreeable jelly, used as a sweetmeat to eat with hare, venison, and Welch mutton, to flavor punch, and as a medicine It is also much used for making wine, and is grown to a considerable extent for that purpose in Essex, Kent, and about Pershore in Worcestershire The principal varieties are the white, and pale or Champagne, but any number of varieties may be procured from sowing the seeds, from which, however, none superior to those in general use have been hitherto originated.

The culture of the red currant is known to every countryman It grows freely by cuttings of last year's wood, which should be of sufficient length to form a handsome plant, with a clean stem, ten inches high. It grows in any soil, but prospers best in one loamy and rich The best flavored fruit is produced from plants in an open free situation, but they will grow under the shade of walls or trees, and either as low bushes or trained against walls or espaliers. They bear chiefly from spurs, and therefore, in pruning, most of the young wood is cut to within two or three buds of that where it originated

R. nigrum, the black currant, is common in moist woods in Russia and Siberia, where a wine is made of the berries alone, or fermented with honey, and with or without spirits In Siberia they make a drink of the leaves: these tincture common spirits so as to resemble brandy, and a few of them dried and mixed with black tea, answer all the purposes of the green material Many persons dislike the very peculiar flavor of the berries

1. *Unarmed* CURRANTS.

3107 Leaves smooth pendulous, Flowers flattish, Petals obcordate, Leaves obtuse 5-lobed, Stem erect
β Berries yellow
γ Lobes of leaves shortish, Leaf-stalks, Flower-stalks, and Flowers pubescent [Stem erect
3108 Rac. rather hairy when in flow erect afterw pendul Brac. shorter than flow. Lvs acum. lob cut toothed,
3109 Racemes spiked pendulous, Petals oblong, Bractes shorter than flowers
3110 Spikes erect, Petals oblong, Bractes shorter than flower
3111 Leaves moderately lobed smoothish above pub beneath, Flowers small, Sepals trifid, Berries red hairy
3112 Racemes erect, Flowers flat, Leaves obtusely lobed, Stem procumb [fruit stiffly upr. Ber rough red
3113 Branc. upr Leaves smooth above beneath pub. nett Lob and teeth acute, Rac loosely many-fl always in
3114 Stems prost. Lvs. lobed smoothish younger pub Rac nearly erect, Petals deltoid, Bract min Berr hispid
3115 Racemes erect, Bractes as long as flowers or longer, Peduncles hairy with glands, Lvs shining beneath
3116 Very smooth, Lvs 3-lobed, Lobes spreading with a few teeth, Bract lin as long as fl -stalks, Berries smooth
3117 Lvs. dotted beneath, Racemes hairy loose, Flow campan Brac shorter than fl -stalks, Ped simple at base
3118 Leaves dotted on each side, Racemes pendulous, Flowers cylindrical, Bractes longer than germen
3119 Leaves cordate 5-lobed cut-toothed smooth, Stalks slender, Racemes loose erect the length of leaves
3120 Glandular hairy, Rac. erect, Lvs 5-lobed obtuse cren roundish, Bractes lingulate longer than fl -stalk

2 *Prickly* GOOSEBERRIES

3121 Spine one under the axillæ, Branches hispid, Lvs small ½-trifid lobes toothed, Berr solitary smooth red
3122 Spine under axillary very short, Lvs on slend stalks pub on both sides lobes acute cut and toothed, Ped.
3123 Prickles solitary, Peduncles 2 or 3-flowered, Berries polished [capillary
3124 Somewhat prickly, Leaves round cut-lobed hairy, Racemes short, Berries rough with hairs
3125 Prickles twin or solitary, Leaves wedge-shaped 3-parted and obsoletely 3-lobed toothed, Fl racemose erect
3126 Branches somewhat prickly reclinate, Bract. of the peduncle 3-leaved
3127 Leaf-stalks hairy, Peduncles 1-flowered, Bractes 2, Fruit hairy
3128 Peduncles 1-flowered, Bractes connate-tubular, Fruit smooth
3129 Branches prickly all over
3130 Spine sub-axillary compound, Stem hispid all over, Leaves lobed beyond middle, Berries racemose hispid
3131 Prickles sub-axillary, Berries prickly racemose dull brown

3132 Leaves like those of the vine stinging cirrhose

3133 Leaves roundish ovate acuminate, Calyxes reflexed pressed close to the spike
3134 Leaves obovate acute narrowed at base, Calyxes reflexed pressed close to the spike
3135 Leaves ovate lanceolate opposite, Spikes elliptical corymbose on long stalks, Stem shrubby
3136 Leaves whorled ovate downy, Corymbs compact dichotomous, Flowers with corollas
3137 Stem erect, Ovate leaves and calyxes smooth
3138 Stem erect rounded and elliptical oblong leaves pubescent, Spikes axillary and terminal stalked

and Miscellaneous Particulars

of the black currant, which are therefore not much used in the kitchen or dessert, and seldom in wine making. They make a jelly or jam in estimation as a gargle for inflammatory sore throats

The culture of the black currant is similar to that of the red, but as it is less apt to bear on spurs than on young wood, the shoots are not so much shortened in this as in the other It is singular that no varieties have been raised of this species, nor will it produce hybrids, as far at least as has been tried with the other cultivated sorts of Ribes

R Grossularia and R. uva crispa are the rough and smooth gooseberries, *Groseille*, Fr, *Johannisbeere*, Ger, and *Uvaspina*, Ital., in universal culture and estimation in Britain, but not much known or esteemed in any other country. The climate of France, Italy, and Spain is too warm, and the summers of many parts of the north of Europe too rapid for their attaining a good size. They are, however, more in vogue now in the latter countries than they have ever been before, but as the quality of the fruit soon degenerates when the plants are not kept in high cultivation, it can never become very popular in countries where the pear, vine, fig, and olive grow freely, and which being planted and once established in the soil, grow and bear for ages with very little care.

The varieties of the gooseberry are very numerous, and yearly increasing in Lancashire and other counties where the fruit is grown for prizes, by raising from the seed These new varieties, however, are valued more according to the size of the berry, than its flavor, or the prolificacy of the plant, so that few so originated are fit to be added to the list of table or kitchen fruit Twenty-five pennyweights is considered a great weight for a gooseberry, but some have been raised a few dwts heavier (See the *Manchester Gooseberry Book*, pub annually)

The gooseberry is generally propagated by cuttings, and trained as a dwarf bush, or sometimes on espalier rails. one variety, the green-gage, makes very neat half-standards, and bears better in that state than as a bush. They require a loamy soil, an open airy situation, and yearly attention to pruning, and refreshing their roots with manure and stirring the surface.

551. *Gronovia*. In honor of John Frederick Gronovius, a learned botanist at Leyden This is a trailing plant like the cucumber, with broad hairy leaves, which sting like the nettle Treated like the melon, it will produce ripe seeds, but is a plant of neither beauty nor use.

552 *Achyranthes* From ἄχυρον, chaff, and ἄνθος, a flower, in allusion to the chaffy nature of the floral envelopes This genus is of easy culture, but little beauty. All root freely by cuttings A porrigens is the only handsome species.

History, Use, Propagation, Culture,

553 Philoxerus From φιλος, a lover, and ξηρος, arid, a plant delighting in sandy soil. The species resemble Gomphrena or Achyranthes

554 Desmochæta From δεσμος, a bond, and χαιτα, a sheath, in allusion to the coherence of the flowers in their heads It was called Pupalia by Jussieu, from its Malabar appellation. Plants nearly related to Achyranthes, in which they were included by Linnæus

555 Illecebrum A name of Pliny, designating a kind of wild purslane. It is now applied to singular little weed-like plants, with white scarious stipules to their leaves

556. Alternanthera, that is to say, alternate anthers, those organs being by turns fertile and barren.

557. Paronychia. Something which cures whitlows, or maladies of the finger nails, called by the Greeks παρωνυχια. These are dwarf plants which grow in light soil, and are well adapted for pots or rock-work.

558 Chenolea From χην, a goose, and *olea*, an olive. The leaves are silvery, like those of the olive; the plant humble like the Goosefoot This plant is noticed for its silvery leaves: it is propagated by young cuttings planted under a hand-glass.

559. Anychia. A word with the same meaning as Paronychia (in No 557.), and a genus with similar habits.

3139 Stems creeping, Leaves rounded fleshy, Heads solitary terminal oblong
3140 Stem erect shrubby, Leaves ovate oblong acuminate, Heads round stalked leafless

3141 Stem ½-shrubby spreading smooth, Leaves opp ovate acum. roughish, Flowers with long purple bristles
3142 Stems shrubby prostrate, Leaves opposite ovate, Fascicles of flowers remote spreading at length reflexed
3143 Stem shrubby spreading, Leaves alternate ovate naked, Fasc. of flowers remote ovate, Bristles callous
3144 Stem erect, Leaves alternate ovate smooth, Racemes many, Fascicles ovate remote, Bristles callous
3145 Stem shrubby spreading pubescent, Flowers in round prickly spikes

3146 Stems filiform smooth, Leaves roundish, Calyxes 5-cornered bearded
3147 Stem branched erect, Leaves rounded smooth bearded, Flowers cymose, Bractes very short
3148 Stem branched prostrate, Flowers clustered axillary naked, Calyxes ventricose beneath hairy

3149 Heads sessile, Flowers smooth three times as long as utricle, Leaves ovate mucronate unequal
3150 Stems creeping hairy, Leaves broad lanceolate stalked, Heads round naked
3151 Heads subsessile, Calyx ovate acuminate nearly as short again as utricle, Leaves ovate lanceolate
3152 Stems creeping smooth, Leaves broad lanceolate stalked, Heads round pubescent
3153 Leaves ovate lanceolate deflexed, Flowers axillary clustered, Cal. spiny, Stem tomentose dichotomous

3154 Stems rising, Leaves carinate oblong ciliated at base, Flowers terminal mixed among the bractes
3155 Stems sub-erect much branched, Leaves spreading villous, Bractes very large concealing the flowers
3156 Stems diffuse, Leaves ovate, Flowers heaped, Bractes shining
3157 Flowers surrounded by shining bracteæ, Stems procumbent, Leaves smooth

3158 The only species

3159 Stem dichotomous, Leaves lanceolate of the stem opposite, of the branches altern Flowers sol axillary

3160 Stem herbaceous erect, Flowers lateral woolly, Leaves alternate ovate
3161 Leaves lanceolate downy, Spikes cylindrical numerous terminal

3162 Leaves ovate oblong, Stem rising panicled, Spikes alternate terminal remote
3163 Leaves ovate acuminate flat, Raceme loose, Bractes scarious, Pistil trifid
3164 Shrubby smooth, Cauline leaves spatulate, Stem leaves lanceolate, Flowers heaped spiked

3165 Half shrubby erect, Branches diffuse, Leaves nearly opp hastate entire smooth
3166 Shrubby erect, Branches unarmed, Leaves entire linear oblong and lanceolate flat beneath powdery

3167 Leaves cordate acuminate, Raceme spiked loose, Flowers trigynous

3168 Stems depressed jointed smooth, Leaves oval obtuse entire red at edge

3169 Leaves linear lanceolate, Stipules falcate, Peduncles angular, Spikes scarious ovate cylindrical
3170 Leaves ovate acuminate, Stipules falcate, Common peduncle striated, Spike oblong compressed
3171 Spikes cylindrical comose, Leaves lanceolate
3172 Leaves ovate upright without auricles, Stem furrowed, Spikes multiple crested
3173 Flowers panicled nodding, Leaves lanceolate, Stem ribbed
3174 Leaves lanceolate ovate lined very much acuminate, Spikes crested, Stipules falcate
3175 Leaves subulate whorled, Stem branched straggling, Spikes compact cylindrical
3176 Leaves wedge-shaped acutish, Spikes globose lateral

and Miscellaneous Particulars

560. *Ærua.* From its Arabic name *êroûâ.* Little weeds like Illecebrum

561 *Lestiboudesia.* Named by M du Petit Thouars, after Fr Jos. Lestiboudois, a Flemish botanist, author of a work called Botanographie Belgique, published in 1781. The species are readily increased either by seeds or cuttings.

562. *Rhagodia.* From ῥαγώδης, bearing berries. The fruit is a small berry, by which character the genus is chiefly distinguished from Chenopodium.

563. *Deeringia.* Named by Mr Brown, in memory of Dr Charles Deering, author of a Flora of Nottingham, and a skilful botanist of his day Weak shrubs, with terminal spikes of flowers, and a berried inflated pericarp.

564 *Trianthema.* From τρεις, three, and ανθος, flowers. The flowers are frequently placed in threes in the axillæ of the leaves Little tropical weeds

565. *Celosia.* From κηλιος, burnt, because the flowers of some species appear as it were singed. C cristata is a well known tender annual, of which there are many varieties, as in the balsam, and which, like that plant, will attain a large size and singular beauty by repeated shiftings Thunberg states that the flowers or crests are frequently a foot in length and breadth in Japan T A. Knight sent a flower to the Horticultural Society

History, Use, Propagation, Culture,

which measured eighteen inches in width, and seven inches in height from the top of the stalk, thick, full, and of the most intense purplish red. (*Hort Trans* iv 322) To produce this, the great object was to retard the protrusion of the flower-stalk Hence, a rich compost was employed, the plants put first into pots of four inches diameter, and then transplanted to others a foot in diameter, the object being not to compress the roots, as that has a tendency to accelerate the flowering of all vegetables The plants were placed close to the glass in a heat of from 70 to 100 degrees, all side branches removed, and pigeon-dung water used in watering Had the shiftings from pot to pot been more frequent, it appears probable the size might have been still greater

566 Gomphrena Gromphrena is a name applied by the ancients to a plant bearing red and green leaves on the same stem, probably our Amaranthus tricolor G globosa is a popular tender annual, valued for its heads of flowers, which, if gathered before they are too far advanced, will retain their beauty several years The other species propagate readily by cuttings under a glass

567. Mollia So called from its softness The species are small weeds.

568. Glaux From γλαυκιον, a name under which Dioscorides describes a maritime plant with glaucous leaves. This plant is maritime, and has glaucous leaves A pretty little plant, and well adapted for pots and rock work. It will grow at a considerable distance from the sea in sand kept moist

569 Thesium Athenæus says, on the authority of Timachides that this plant was called Θησιον, because it formed part of the garland presented by Theseus to Ariadne If this be so, the accent should be placed on the penultimate and not on the antepenultimate syllable It is, however, very certain that the Thesion of the ancients had no resemblance to that of the moderns, which is a genus of little obscure plants or weeds.

570. Heliconia A name given to this plant in an ingenious sense, as indicating its affinity with Musa. H Bihai is a large herbaceous plant, bearing considerable resemblance to Strelitzia It grows in rich well

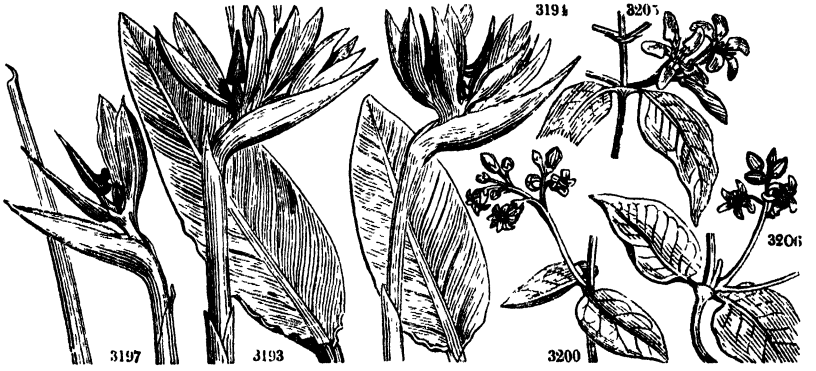
3177 Stem erect hairy, Leaves oblong pubescent, Heads globose solitary 2-leaved, Keels of bracteæ winged
3178 Leaves lanceolate, Heads 2-leaved, Florets distinguished by a peculiar perianthium
3179 Hairy twining
3180 Stem ascending, Leaves oblong silky beneath, Spikes clustered panicled terminal interrupted

3181 Stem branched diffuse, Leaves spatulate whorled about 7, Calyxes with a membranous margin
3182 Stem branched diffuse, Leaves lanceolate silky bearded

3183 The only species

3184 Spike branched, Bractes 3, Leaves linear lanceolate with a very short tube to the calyx
3185 Stems prostrate simple, Raceme terminal leafy 1-sided, Flowers sessile surrounded by bracteæ
3186 Stem erect simple, Raceme leafy, Flowers stalked without smaller bracteæ
3187 Leaves obovate mucronate, Flowers racemose
3188 Leaves cordate stem-clasping, Racemes terminal

3189 Leaves at the base and end acute, Spadix erect radical, Spathes 2-ranked many-flowered
3190 Leaves narrowed at base at end acumin Spadix erect flexuose radical, Spathes 2-ranked many-flowered
3191 Leaves very smooth nerved rounded at base, Inflorescence very smooth, Spadix erect without bracteæ



3192 Scape half as short as leaf-stalks which are hardly twice as long as the 6 feet leaf
3193 Scape scarcely longer than the leaf-stalks which are three times as long as the oval leaf
3194 Scape longer than leaf-stalk and leaves, Leaf-stalk twice as long as the ovate oblong leaf
3195 Scape a little longer than the leaf-stalks which are half as long again as the obl leaf unequal at the base
3196 Scape as long as leaf-stalk which is 7 times longer than the lanceolate leaf
3197 Scape the length of the leaf-stalk which is 20 times longer than the linear lanceolate leaf
3198 Scape as long as leaf-stalk which is twice as long as the ovate concave leaf
3199 Leaf-stalk very long with no leaf

DIGYNIA

3200 Stem upright herbaceous, Leaves ovate smooth on each side, Cymes terminal smooth
3201 Stem upright herbaceous, Leaves oblong tomentose beneath, Cymes lateral longer than the leaves
3202 Stem erect herbaceous, Leaves oblong cordate smooth, Cymes shorter than the leaves
3203 Stem erect herbaceous, Leaves elliptical lanceolate mucronate at the edge rough with little teeth

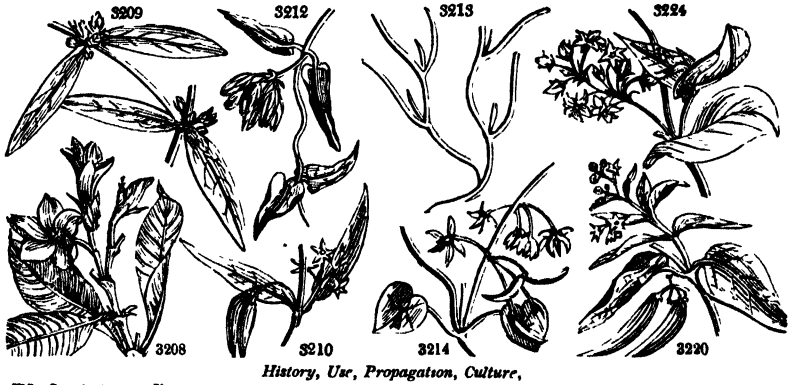
3204 Leaves oblong ovate thick at edge, Panicle downy
3205 Leaves oval lanceolate acuminate, Panicle smooth

3206 Flowers terminal hairy inside
3207 Flowers smooth, Segments obtuse, Cymes trichotomous, Leaves oblong lanceolate veiny smooth

and Miscellaneous Particulars

shaded gullies in moist woods The berries are small and succulent, and each contain three hard rugged seeds

H Pattacorum bears a great resemblance to Canna · it grows in the wet parts of woods, and on the highest mountains All the species require a strong heat to make them flower freely



571 *Strelitzia* So named by Sir Joseph Banks, in honor of Charlotte, queen of George III, of the family of Mecklenburgh Strelitz, and said to have patronized botany This is a splendid genus, generally kept in the stove; but which, Sweet observes, "will thrive, and flower as well in the greenhouse or conservatory A light sandy loam is the best soil for the species, and they may be increased, but slowly, by suckers. By rubbing the pollen on the stigma, when the plants are in bloom, perfect seeds are readily obtained." (*Bot Cult* 111)

572 *Apocynum* From *απο*, away, and *κυων*, a dog, that is to say, a plant from which dogs must be driven Pliny says his Apocynum is mortal to them This is a genus of plants of little beauty, but of easy culture in any soil The first species is acrid and blisters the skin From the stalks of A. cannabinum the Indians of North America prepare a substitute for hemp, of which they make twine, bags, fishing-nets and lines, and linen for their own wear

573 *Melodinus.* So named by Forster, from *μηλον*, an apple, and *δινεω*, to turn round, this plant bearing a round fruit like an apple, and having a twining stem by which it climbs trees It is a very smooth shrub, with oblong-ovate leaves, and nearly allied to Rauwolfia Cuttings root readily in sand under a hand-glass This, and the succeeding genera, as far as No 592, are all Asclepiadeous plants, and require nearly similar management

574 *Periploca.* From *περιπλοκη*, intertwining, in allusion to the habit of the plants. P græca is a handsome climber, and grows freely in common garden soil, and is propagated by cuttings under a glass, or by layers.

History, Use, Propagation, Culture,

575 *Cryptostegia* From κρυπτος, concealed, and στεγη, a covering The name was suggested to Mr Brown by the circumstance of the enclosure of the corona within the tube of the corolla, and its not being exposed to view, as in the other neighbouring genera

576. *Hemidesmus* From ἡμισυς, half, and δεσμος, a bandage, in allusion to the incomplete coherence of the anthers with the stigma, by which the genus is principally distinguished from Periploca. Cuttings root readily in sand in heat.

577. *Secamone* The meaning of this word is very obscure None of the explanations which have been offered of it are even tolerable Culture as in Periploca.

578 *Microloma.* From μικρος, small, and λωμα, a fringe; but the application is unexplained by the author of the name. Small climbing shrubs, with opposite leaves and interpetiolar umbels

579. *Sarcostemma.* From σαρξ, flesh, and στεμμα, a crown, on account of the thick succulent nature of the coronal processes

580. *Dæmia.* Dæmia appears to be an Arabic name It has been applied by Forskâhl to a species of Asclepias referred hither A genus of twining plants

581 *Cynanchum.* From κυων, a dog, and αγχειν, to strangle A word having the same meaning and application as Apocynum. This is a genus of low shrubs and herbaceous plants, for the most part twining, and all of easy culture and propagation.

582. *Oxystelma.* From οξυς, sharp, and στελμα, a crown; the corona being very much pointed.

583. *Gymnema.* From γυμνος, naked, and νημα, a thread, or, in botanical language, stamen; in allusion to

3208 The only known species

3209 Spikes axillary imbricated, Leaves elliptical obtuse mucronate, Stem smooth

3210 Flowers hairy inside panicled, Leaves lanceolate elliptical
3211 Flowers smooth, Corymbs few-flowered axillary, Leaves linear lanceolate without veins

3212 Leaves sagittate pubescent, Limb of the corolla acute

3213 Stem twining perennial leafless

3214 Stem twining shrubby, Leaves cordate acute, Flowers hairy at edge

3215 Leaves oblong ovate cordate acute, Segments of cor oblong obtuse
3216 Leaves reniform contracted at end ½ lanceolate, Segm of cor lanceolate obtuse
3217 Leaves cordate ovate obtuse fleshy with a little point smooth, Crown 10-cleft as long as corolla
3218 Leaves ovate acute and calyxes hairy, Crown 10-cleft as long as corolla
3219 Stem erect, Flowers beardless, Partial stalks of umbel twice as long as common stalks, Crown 5-lobed

3220 Stem climbing upwards, Fl bearded, Partial stalks of simple umbel scarcely longer than common stalk
3221 Leaves lanceolate linear opposite and three together, Stem decumbent
3222 Stem twining upwards, Corollas beardless, Stalks of umbel divided, Corona 5-lobed
3223 Leaves oblong cordate acuminate wavy, Umbels axillary proliferous
3224 Stem hairy, Leaves heart-shaped mucronate, Umbels axillary proliferous
3225 Leaves cordate ovate acuminate, Umbels simple solitary, Partial flower-stalks longer than common one

3226 Cor. smooth rotate, Racemes axillary, Leaves linear lanceolate veiny

3227 Leaves rounded ovate netted pubescent beneath, Flowers in umbels

3228 Segments of cor spreading
3229 Segments of cor reflexed involute

3230 Leaves thick fleshy ovate

3231 Leaves sessile oblong lanceolate wavy smooth, Umbels lateral, Petals ciliated

3232 Leaves ovate oblong smooth obtuse with a point
3233 Leaves cordate lanceolate wavy hispid
3234 Leaves linear lanceolate smooth

3235 Leaves oval downy beneath, Stem simple, Umbels nodding
3236 Stem erect simple, Leaves broad ovate oblong acute smooth paler beneath, Umbels nodding
3237 Stem simple downy in two rows, Leaves subsessile oblong oval downy beneath

and Miscellaneous Particulars.

the peculiar structure of the stamens The milk of Gymnema lactiferum is used instead of the Vaccine ichor, and the leaves are employed in sauces in the room of cream

584 *Calotropis* From καλος, beautiful, and τρεπω, to turn, in allusion to the beauty of the flowers, which continually turn towards the sun This is a handsome free-flowering genus Young cuttings root freely in sand under a hand-glass, but not crowded, as, if the leaves are injured, they are very apt to damp and get mouldy

585. *Dischidia.* From δις, twice, and σχιζω, to split; but the application is unexplained. Little trailing plants with small opposite fleshy leaves.

586 *Xysmalobium* From ξυσμα, a fragment of a thing, and λοβος, a division, on account of the minute alternate divisions of the corona. The flowers of this genus are very large, those of X. grandiflorum are of the size and color of Fritillaria meleagris.

587. *Gomphocarpus.* From γομφος, a club, and καρπος, fruit. A genus resembling Asclepias in habit, but well distinguished by the inflated club-like fruit

588 *Asclepias.* The name of many ancient physicians It is the Greek name of the Æsculapius of the Latins. This is a genus of tall-growing herbaceous plants, which thrive best in peat or any very light soil They require a good deal of room to show their characters, and are readily propagated by seeds or dividing the roots. A. syriaca is very odoriferous, and in Canada, when in flower, charms the traveller, especially when passing through woods in the evening The French there eat the tender shoots in spring as we do asparagus. The natives make a sugar of the flowers, gathering them in the morning when they are covered with dew, and collect the cotton from the pods to fill their beds On account of the silkiness of this cotton, Parkinson calls the plant Virginian silk.

A. nivea has jointed fleshy roots, the juice of which is very effective in bringing away worms. The root

History, Use, Propagation, Culture,

dried and reduced to powder, is frequently used by the negroes as a vomit, and hence its name of wild or bastard Ipecacuanha.

A. **vincetoxicum** (tame-poison) is so named because it was formerly esteemed an alexipharmick, and it is called swallow-wort from the fancied resemblance of the follicles or seeds to a swallow flying

589. *Gonolobus* The derivation and meaning of this word have not been explained. The genus consists chiefly of climbers of little beauty but easy culture

590. *Pergularia* From *Pergula*, trellis-work, which the plants are very proper for covering This is a climbing genus, much valued for the fragrance of its flowers it grows well in loam and peat, and cuttings root freely in sand under a hand-glass

591 *Marsdenia* So named by Mr R Brown, after William Marsden, Esq. the author of the excellent

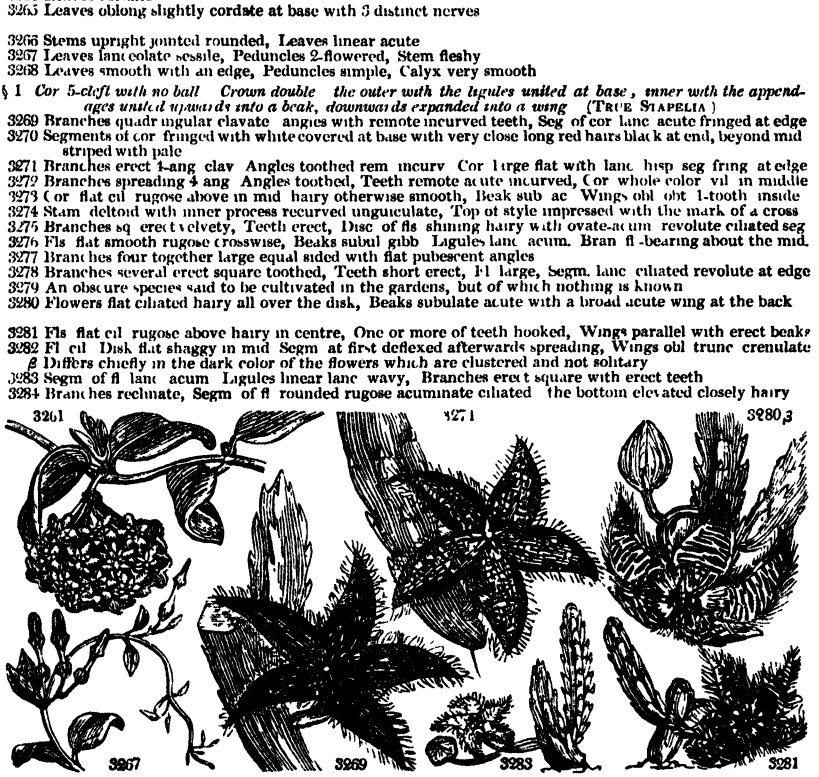
3238 Stem simple, Leaves ovate villous beneath, Umbels erect, Nect. resupinate
3239 Leaves ovate rugose naked, Stem simple, Umbels subsessile, Flower-stalks downy
3240 Leaves stalked lanceolate smooth shining, Stem simple, Umbels erect solitary lateral

3241 Leaves ovate-lanceolate smooth, Stem simple, Umbels erect lateral solitary
3242 Leaves lanceolate acuminate smooth narrowed at base, Stem half shrubby erect, Umbels lateral solitary
3243 Leaves lanceolate smooth, Stem divided upwards, Umbels erect in pairs
3244 Leaves lanceolate pubescent beneath, Stem divided upwards, Umbels erect in pairs
3245 Leaves villous, Stem decumbent
3246 Stem erect simple downy in lines, Leaves very narrow linear mostly whorled
3247 Stem decumbent and leaves very long linear pubescent, Appendages of crown without horns
3248 Stem erect hairy with spreading branches at end, Leaves scattered lanceolate hairy
3249 Leaves linear subulate channelled, Umbels stalked nodding. lateral many-flowered

3250 Runners and leafstalks very hairy, Lvs acum by degrees perceptibly hairy on both sides, Foll muricated
3251 Runners smoothish, Leaves conical cordate acute by degrees, Flowers and follicles smooth
3252 *Leaves cordate acuminate with the sinus open*
3253 Leaves cordate, Corymbs axillary, Common flower-stalk longer than the leafstalks Cor discolored
3254 Leaves oblong cordate with the sinus closed, Petals crisp at end
3255 Villous, Leaves oblong elliptical lanceolate cordate, Crown at bottom of tube

3256 Leaves cordate acuminate, Cal shorter than tube of cor.
3257 Leaves cordate obtuse with a point, Cal as long as tube of cor
3258 Leaves ovate lanc very smooth, Cymes shorter than leaves, Sap blood-colored

3259 Stem erect, Leaves cordate ovate acute, Cymes umbellate, Flowers not bearded
3260 Stem somewhat erect, Leaves oval-lanceolate smooth veinless, Tube inflated, Orifice bearded



3261 Leaves ovate, Flowers bearded
3262 Leaves ovate-lanceolate acute small
3263 Leaves obovate obtuse very thick
3264 Leaves cordate
3265 Leaves oblong slightly cordate at base with 3 distinct nerves

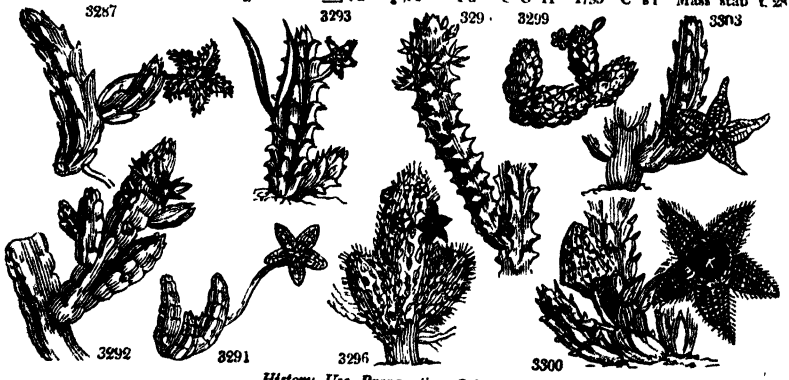
3266 Stems upright jointed rounded, Leaves linear acute
3267 Leaves lanceolate sessile, Peduncles 2-flowered, Stem fleshy
3268 Leaves smooth with an edge, Peduncles simple, Calyx very smooth

§ 1 *Cor 5-cleft with no ball Crown double the outer with the ligules united at base, inner with the appendages united upwards into a beak, downwards expanded into a wing* (TRUE STAPELIA)

3269 Branches quadrangular elavate angles with remote incurved teeth, Seg of cor lanc acute fringed at edge
3270 Segments of cor fringed with white covered at base with very close long red hairs black at end, beyond mid striped with pale
3271 Branches erect 4-ang clav Angles toothed rem incurv Cor large flat with lanc hisp seg fring at edge
3272 Branches spreading 4 ang Angles toothed, Teeth remote acute incurved, Cor whole color vil in middle
3273 Cor flat cil rugose above in mid hairy otherwise smooth, Beak sub ac Wings obl obt 1-tooth inside
3274 Stam deltoid with inner process recurved unguiculate, Top of style impressed with the mark of a cross
3275 Branches sq erect velvety, Teeth erect, Disc of fls shining hairy with ovate-acum revolute ciliated seg
3276 Fls flat smooth rugose crosswise, Beaks subul gibb Lagules lanc acum. Bran fl-bearing about the mid.
3277 Branches four together large equal sided with flat pubescent angles
3278 Branches several erect square toothed, Teeth short erect, Fl large, Segm. lanc ciliated revolute at edge
3279 An obscure species said to be cultivated in the gardens, but of which nothing is known
3280 Flowers flat ciliated hairy all over the disk, Beaks subulate acute with a broad acute wing at the back

3281 Fls flat cil rugose above hairy in centre, One or more of teeth hooked, Wings parallel with erect beaks
3282 Fl cil Disk flat shaggy in mid Segm at first deflexed afterwards spreading, Wings obl trunc crenulate
β Differs chiefly in the dark color of the flowers which are clustered and not solitary
3283 Segm of fl lanc acum Ligules linear lanc wavy, Branches erect square with erect teeth
3284 Branches reclinate, Segm of fl rounded rugose acuminate ciliated the bottom elevated closely hairy

and Miscellaneous Particulars



History of Sumatra, in which one species, used as Indigo in the island is figured. Little neat shrubs, with axillary bunches of small white sweet-scented flowers

592. *Hoya* Named after Mr Thomas Hoy, for many years gardener to the Duke of Northumberland He died about 1821 H carnosa is of easy culture, flowers freely, and is propagated by cuttings in a moist heat. Its flowers are very mellifluous, and it has been said that one or two plants, placed when in flower in a vinery of ripe grapes, will entice the wasps from eating the fruit

593. *Ceropegia* From κηρος, wax, and πηγη, a fountain, literally, a fountain of wax, poetically, a candelabre, on account of the umbels of bright yellow flowers. Curious naked plants with tumid fleshy stems. Same culture as Hoya.

594 *Stapelia* So named by Linnæus, in memory of Bodæus à Stapel, a physician of Amsterdam, com-

History, Use, Propagation, Culture,

mentator on Theophrastus, 1644. This is a genus of singular plants, without leaves, diminutive, very succulent, and some of them with flowers large in proportion to the plant, curious, and often smelling very disagreeably. They are mostly natives of the deserts of Africa, and have been chiefly discovered by Masson,

3285 Flowers cuspidate rugose scabrous ciliated, Beaks half split
3286 Branches and branchlets upright square quite smooth, Angles toothed, Teeth erect, Flower flat hispid
3287 Branches many erect square, Angles toothed, Teeth erect acute, Cor. covered with clavate glands
3288 Cor very villous with white spatulate hairs, Ligules minute rhomboid-oblong entire
3289 Branches several suberect 4 cornered toothed, Flower flat smooth rugose, Segments caudate
3290 Pedunc. aggreg rad much longer than cor Segm acum hispid with clavate hairs, Beaks subul conniving
3291 Branches many divaricating square toothed, Flower flat with ovate obtuse rugose segments
3292 Branches many erect square toothed, Flowers clustered sessile, Segm. lanc acute folded back
3293 Branches many erect square with spreading acute teeth, Flowers solitary stalked, Segm. setaceous
3294 Branches erect square toothed, Teeth spreading acute, Flowers sessile, Segm. lanc flat
3295 Branches several square toothed recurved, Flower small, Segm narrow flat spreading fringed at edge
3296 Branches several rounded furrowed tubercled hairy, Flower solitary sessile
3297 Branches and branchlets rounded tubercled spiny, Flowers solitary large 10-cleft
3298 Cor smooth, Seg. lanc Fl stalks shorter than cor Branches flowering in mid. 6-sid with prickly tuber
3299 Joints of branches obl round nett. obscurely watted, Spines sm Cor wart above with triangular segm.
3300 Branches several erect sq with nearly upright acute teeth, Fl flat rough 5-cleft with ov lanc. ciliate seg.
3301 Cor. rugose dark with pink hairs, Branches thick short yellowish green

3302 Cor ciliated rough above dotted beneath, Ligules erect 3-parted · middle lanceol longer than sides
3303 Branches many erect square smooth, Cor flat smooth with lanceolate obtuse segments
3304 Teeth of branches rounded, Fls closed ventricose with 5-nerved ov. acum seg Beaks split open

3305 Ball spurious depressed 5 crenate in the circumference, Beaks and wings rounded obtuse, Tube of cor O.
3306 Cor 5-parted flat hairy warted across, Appendages obtuse obscurely toothed, Beaks subulate conniving

§ 2 *Cor. 5-cleft with no ball Ligules not connate at base spreading Appendages lengthened into incurved beaks, gibbous, but not winged at back* (GONOTHEMON *Haw.*)

3307 Branches several sq divaricat smooth tooth narr by deg Cor very smooth 5-cleft, Seg lanc spreading

§ 3. *Cor 5-cleft with a ball Ligules connate spreading Appendages lengthened into incurved beaks, not winged.* (PODANTHES *Haw*)

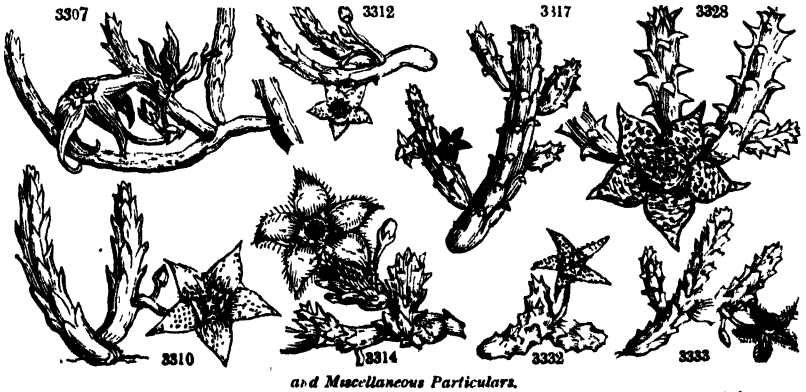
3308 Much branched weak, Flowers in pairs wrinkled minutely hairy at bottom
3309 Branches many suberect toothed, Teeth spreading acute crossing, Cor flat rugose, Segm lanc acute
3310 Branches many erect with acute crossing teeth, Cor flat wart elevated in the middle into a rough table
3311 Cor 5-cleft camp smooth dotted even at bottom, Segm of outer crown ob emarg Inner hooked 2-lobed
3312 Branches several reclinate with acute teeth, Fl clustered, Segm triangular acute with a round centre
3313 Rim obsolete, Beaks roun led obtuse, Wings conical subulate acute spreading, Ligules retuse
3314 Stem square with spreading teeth, Flower stalked, Segm ovate scaly ciliated

§ 4 *Cor 5-cleft reflexed with no ball Ligules connate at base Appendages lengthened into long beaks with short wings* (TROMOTRICHE *Haw*)

3315 Branches square erect with spreading teeth, Cor smooth, Segments ciliated acute revolute
3316 Segm of cor ovate acute fringed revolute, Beaks clavate, Branches square with rounded angles
3317 Branches square toothed, Teeth recurved, Segm of cor flat ovate hairy

§ 5 *Cor 5-cleft, with a large ball in the middle Ligules connate at base Appendages produced into long beaks, and subulate or filiform wings* (ORBEA *Haw*)

3318 Cor 5-cleft rugose smooth, Segm ovate-acumin bent obliquely, Marginal fringe clavate white and violet
3319 Ball solid, Beaks and wings rounded obtuse, Ligules trifid, Cor. flat beneath fringed at mouth
3320 Cor 5-cleft, Ligules oblong emarginate, Sepals broad ovate acuminate, Branches thick green not spotted
3321 Ball spurious, Beaks rounded obtuse, Wings subulate obtuse spreading, Ligules bifid acute
3322 Cor. sulphur colored with entire ligules

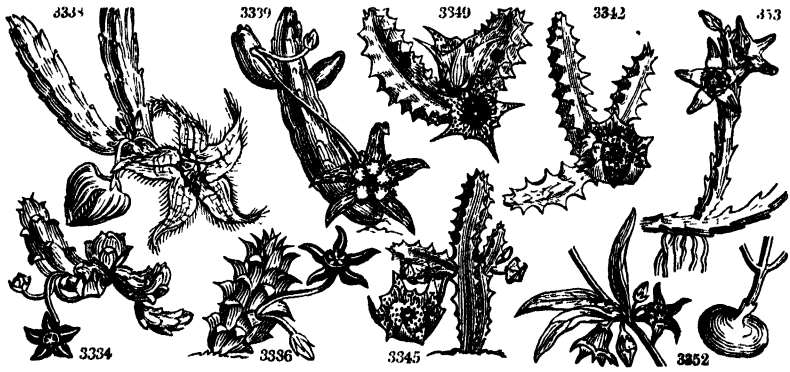


3323 Ball spurious, Beaks rounded obtuse, Wings subulate obtuse spreading, Ligules bifid, Cor flat beneath
3324 Ball 5 angular, Ligules 2-toothed obt Appendages diverging the inner clavate the outer subulate obtuse
3325 Cor fringed at edge with clavate hairs, Ball tumid, Appendages bifid diverging
3326 Cor rugose across flat dotted in a regular maner, Inner horns hooked obtuse, Ball round tumid
3327 Branches several erect spreading 4-cornered toothed, Ball closely dotted, Segm. rugose cordate striated
3328 Ball spurious, Beaks round. obt Wings filiform obt. spreading, Ligules bifid obt Cor flat with no tube
3329 Ball large, Ligules half divided, Speckles of flower wavy tortuous
3330 Branches simple 4-furrowed torulose, Seg ov acum. rugose, Ball elevated rugose depressed in middle

§ 6 *Cor 5-cleft flat with no ball. Ligules none Appendages produced into a short beak and a longer incumbent wing* (OBLSIA *Haw*)

3331 Cor 5-cleft strigose, Seg revolute at edge, Wings hooked incumbent on their beak, Shield 5-lobed fleshy
3332 Joints of stem obl rounded, Fls in pairs, Seg. of cor lanceolate acuminate rough above revolute at edge

§ 7 *Cor 5-cleft, with the segments folded back Ligules none Appendages or beaks simple, with no wings* (DUVALIA *Haw*)



3333 Branches several 4-cornered reclinate with acute spreading teeth, Segm of flower folded back fringed

and Miscellaneous Particulars.

a collector for Kew gardens about the end of the last century, and who published a monograph of the genus. They have been divided into several genera by Haworth, who has not been followed by other writers Some of the species, as S. pilifera and articulata, are eaten by the Hottentots and by the Dutch settled at the Cape

History, Use, Propagation, Culture,

pickled in vinegar, but in general they are without use According to Sweet, "the best soil for them is a sandy loam, mixed with old lime or brick rubbish, if planted in a richer soil, they will thrive better for a time, and produce larger flowers, but then they are very apt to rot off, particularly if they chance to get a little too much water a very little water serves them, except when in flower, when it may be given more freely They are readily increased by cuttings, which should be laid to dry in the stove, till they begin to shrivel, then planted in pots they will root immediately If planted as soon as taken off, when full of juice, they are likely to rot. (*Bot Cult* 169)

595. *Piaranthus* From πιαρος, fat, and ανθος, a flower, on account of the fleshy nature of the corolla. The species are only artificially distinguished from Stapelia

596. *Huernia.* Named after Justus Huernius, an obscure botanist. The species have the same appearance

3334 Branches several clustered oblong toothed, Segm of cor 3-angular hispid fringed at edge
3335 Branches clustered procumbent 4-cornered with spreading acute teeth, Seg of cor folded back fringed

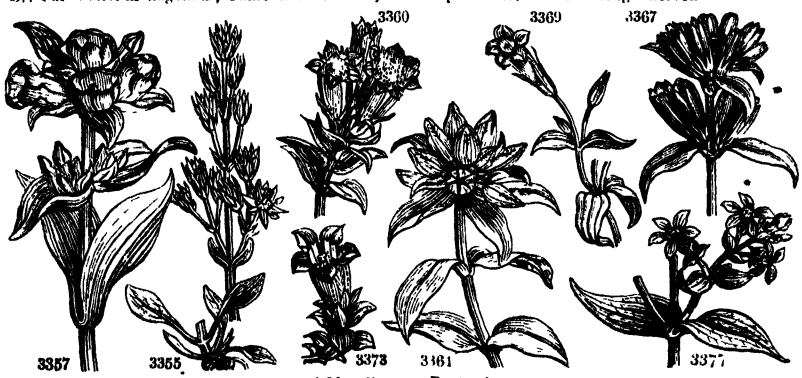
3336 Branches clustered short with conical acute teeth, Segm. of cor distant folded back naked
3337 Cor with seg refl at edge and fringed with simple hairs, Bottom rounded elevated, Lig falcate hooked
3338 Cor rugose ciliat pubes in midd Seg revolute at edge all bent down, Beaks subul. Wings scarcely any

§ 8 *Cor. 5-cleft with no ball Ligules not connate at base, spreading Appendages elongated into a bifid rostrum, with globose fungous tips* (CARUNCULARIA. *Haw*)

3339 Branches several divar 4-corn. toothed, Ped very long, Seg of cor lanc rev at edge with fringed angles
3340 Branches oblong jointed, Peduncles twin, Cor revolute at edge with wings and lobes serrated at end

3341 Six-cornered erect with spreading prickles, Flower sessile clustered, Segm of cor lanceolate silky above
3342 Joints 4-cornered toothed, Flowers fascicled, Segm of cor lanceolate papillose

3343 Branches 5-cornered toothletted, Cor with 10 angles, Tube bearded inside and elevated into a ball
3344 Cor campanulate closed at bottom by clavate horizontal hairs, Ligules spreading truncate dark
3345 Branches 4 and 5-cornered, Young branches very much spreading, Cor 10 cleft, Tube smooth
3346 Cor 10-toothed, Alternate segments obsolete, Branches 5-cornered spreading with hooked tubercles
3347 Cor concave at bottom, Stems simple above glaucous, The teeth of the branches horizontal
3348 Branches several 4-5 angular spreading, Cor rounded 10-cleft, Segm alternately longer, Flowers solitary
3349 Branches simple very thick 4-5-cornered with very large teeth
3350 Branches several 4-5-cor clust nearly erect, Teeth of branches acute spreading, Cor campanul 10-cleft



3351 Cor campanulate dotted inside, not dotted outside, Beaks gibbous, Shield low with 5 emarginate lobes

3352 The only species

3353 Branches distant 4-cornered long slender ascending, Flowers with segments tipped with purple
3354 Branches clustered 4-cornered short thick erect, Flowers in close terminal heads

3355 Cor 5-cleft, Peduncle 4-cornered, Stem undivided, Radical leaves oval

3356 Cor 5-cleft rotate whorled, Whorls cymose, Calyxes spathaceous, Leaves broad ovate
3357 Cor 5-cleft campanulate dotted in streaks whorled, Cal membr. nous spathaceous
3358 Cor. 6-cleft campanulate much dotted whorled, Cal coriaceous truncate
3359 Cor 6-cleft campanul much dotted whorled, Cal membr truncated, Lobes shorter than tube of cal uneq
3360 Cor hypocrateriform 5-7-cleft, Intermediate segments torn, Leaves cruciate 3-nerved
3361 Cor 5-cleft campanulate opp axillary subsessile, Leaves stem-clasping ovate-lanceolate
3362 Cor 4-5-cleft sessile whorled, Radical leaves as long as stem which is naked beneath
3363 Cor 4-cleft naked hypocrateriform whorled subsessile, Stem two edge narrowed at base
3364 Flowers terminal sessile, Cor 10-cleft ventricose acute, Alt segm shorter entire, Leaves lanceolate
3365 Flowers clustered terminal tub-shaped with an unequal lacerated mouth, Leaves oval
3366 Flowers in whorled heads sessile, Cor 10-cleft ventric closed, Alt segm fringed smaller, Lvs ovate lanc
3367 Flowers whorled ventricose 10-cleft, Segm alternately bifid and torn, Lvs remote oppos and ternate
3368 Cor 5-cleft campanulate acuminate terminal and axillary stalked, Leaves linear obtuse
3369 Cor 5-cleft hypocrat beard Seg ovate, Cal trunc with equ subul teeth, Lvs ov lanc as long as branches
3370 Cor campanulate 5-cleft toothed between the segments, Cal 3-toothed opening on one side, Lvs lanceolate
3371 Cor campanulate 5-cleft clustered sessile, Leaves linear floral alternate lengthened
3372 Cor campanulate 5-cleft terminal stalked 3 together, Segm acute, Leaves lanceolate 3-nerved
3373 Cor 5-cleft campanulate as long as the square stalk
3374 Cor 5-cleft funnel shaped, Leaves ovate acute radical spreading larger than the cauline
3375 Cor 5-cleft funnel-shaped, Leaves ovate obtuse radical clustered imbricated less than the cauline
3376 Cor 5 cleft funnel-shaped, Branches alternate 1-flowered, Cauline leaves lanceolate
3377 Cor 5-cleft monogynous, Panic trichotomous, Bractes perfoliate, Leaves oblong 3-nerved

and Miscellaneous Particulars

as Stapelia, require the same culture, and are natives of the barren blowing sands of the Cape of Good Hope

597 *Brachystelma.* From βραχυς, short, and στεμμα, a crown, in allusion to the shortness of the coronal processes in the flower of this plant

598. *Caralluma* The Indian name of this plant, which exactly resembles Stapelia in appearance

599 *Swertia* So named by Linnæus, in honor of Eman Sweert, a cultivator of bulbs and flowers in Holland, and author of Florilegium, 1612 *Pretty herbaceous plants, with blue flowers*

600 *Gentiana* From Gentius, King of Illyria, who, according to Pliny, first discovered the tonic virtues of plants of this genus "This is a very handsome genus of herbaceous plants: most of the species succeed well in a light rich soil, but a few require peat, and some must be grown in pots to be protected by frames in winter

History, Use, Propagation, Culture,

Some of them may be increased by dividing at the root, but most of them seed freely, the seeds should be sown as soon as ripe, they will then quickly vegetate, but if left till spring before they are sown, they will not come up till the second year (*Bot Cult* 371)

G lutea has a thick root of a yellowish brown color, and very bitter taste In Switzerland and Germany it occupies extensive tracts of ground untouched by any cattle It was formerly used as hops in brewing, and is at present the principal European bitter used in medicine The root of G purpurea is as thick as a man's arm and two feet long, it is extremely bitter, and used as a substitute for G lutea.

G acaulis and verna are two beautiful edging plants, and answer well in pots.

601 *Hydrolea* From ὕδωρ, water, and ἐλαία, oil. It is a water plant, and its leaves are viscous, as if they were smeared with old oil. A very pretty plant with bright blue flowers

602. *Falkia* Named after John Falk, a Swede, born in 1725, died in 1774 He was professor of botany in the apothecaries' garden at St Petersburg, and followed Pallas during a part of his journey in Siberia. Upon his return he committed suicide, perhaps the only instance upon record of suicide among naturalists

603 *Dichondra* From δίς, double, and χονδρος, grain, on account of the double nature of the capsule Little inconspicuous trailing plants, seldom seen or desired in collections.

604 *Velezia.* So named by Linnæus, in memory of Christoval Velezius, examiner, first physician, and demonstrator of botany in the college of apothecaries at Madrid. A small weed, native of the south of France, resembling a dried up Gentiana

605. *Bumalda.* Named after Ovide Montalban, better known under the name of Jean Antoine de Bumalda, born at Bologna, published in 1657 a Bibliotheca Botanica, and in 1668 a Dendrologia

606. *Heuchera.* In memory of Jean Henry de Heucher, archiater, and professor of medicine at Witteberg,

3378 Leaves obovate oblong 3-nerved, Flowers terminal clustered, Cor. ventricose not opening
3379 Cor. campanulate 5-cleft terminal and axillary clustered, Intermed segm torn, Leaves lanc 3-nerved
3380 Cor 5-cleft hypocrateriform bearded, Segm lanc acute, Leaves lanc Branches shorter than joints
3381 Cor. 4-cleft hypocrateriform obtuse, Orifice bearded, Two outer sepals very large
3382 Cor 4-cleft, Segm serrated finely cut in the middle, Leaves lanceolate and linear, Stem flexuose angular
3383 Cor 4-cleft, Segm finely cut, Leaves lanceolate acute, Stem erect rounded

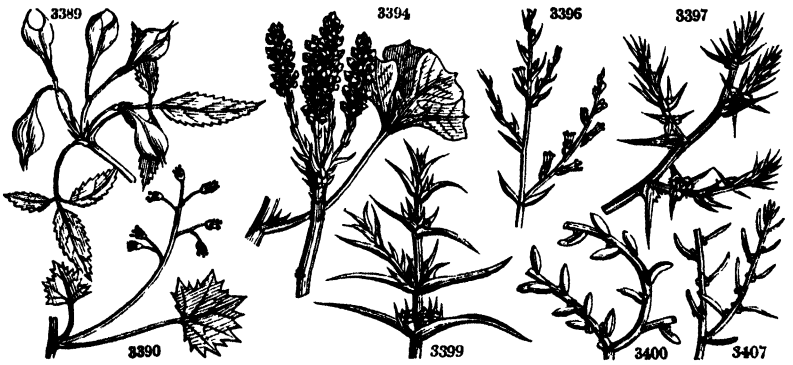
3384 Leaves lanceolate, Flowers terminal corymbose, Capsules a little hairy

3385 A creeping plant with cordate obtuse stalked leaves

3386 Pubescent, Leaves reniform retuse and emarginate
3387 Leaves reniform emarginate pubescent beneath

3388 The only species

3389 A slender branched purple shrub



3390 Viscid, Scape and leaves roughish, Leaves rounded lobed toothed, Pet lanc Stam much exserted
3391 Powdery, Scape and lvs below smooth, Lvs acutely lobed toothed, Pet spatulate, Stam scarcely exserted
3392 Very villous, Leaves acutely lobed, Pet shorter than calyx, Stamens exserted
3393 Shrubby at base, Lvs. smooth above acutely lobed toothed, Cal short villous, Pet linear, Stam exserted

3394 Leaves digittate, Leaflets sessile wedge-shaped truncate 3-toothed, Flowers racemose
3395 Leaves digittate, Leaflets 7-3-parted wedge-shaped acuminated serrated at end, Flowers spiked

3396 Leaves subulate, Pericarps not juicy

3397 Spreading hairy, Leaves subulate mucronate, Calyxes solitary, Appendages opened out colored
3398 Leaves subulate mucronate, Calyxes opened out
3399 Smooth, Branches ascending, Lvs half round acute, Cal in fruit keeled across the middle membranous
3400 Herbaceous, Leaves rounded smooth, Flowers clustered
3401 Erect spreading hairy, Leaves oblong half round obtuse, Flowers twin axillary
3402 Leaves rounded pubescent, Flowers axillary, Anthers colored
3403 Pubescent, Branches panicled, Leaves filiform with an axillary tuft, Floral very short, Cal solitary
3404 Tomentose, Cal with 5 angles and 5 awns, Leaves lanceolate flat

3405 Pubescent, Leaves linear flat, Cal clustered woolly with a hooked dorsal spine
3406 Leaves broad lanceolate toothed, Cal. surrounded by a toothed crown, Seed round emarginate on one side
3407 Erect, Leaves filiform obtuse fleshy, Flowers axillary sessile 3 together, Style trifid

and Miscellaneous Particulars

author of Hortus Wittebergensis, 1711-13. Very neat North American plants, requiring the culture of alpine plants.

607 *Cussonia* In memory of Cusson, a celebrated botanist, who after laboring to complete the order of umbellate plants, had all his labor annihilated by his wife, who in his absence used the paper upon which his plants had been glued for household purposes. It is a genus of easy culture, and readily increased by cuttings planted in sand and placed under a hand-glass.

608 *Anabasis* One of the names given by the Greeks to the Equisetum. A small plant, quite similar to some species of Chenopodium

609 *Salsola* From *salsus*, salt. From these plants, which are chiefly maritime, is obtained the *kelp* of our shores This is a genus of plants producing the alkaline salts called barilla, soda, potash, and kelp. Most of them are herbaceous and annual, but some have shrubby stems.

S. kali, (*Qaly* or *álqaly*, Arabic. *Bochart,*) is found on the sandy shores of most parts of the world, and is very generally burned for soda for the glass manufacture.

S soda is cultivated in Languedoc and also in Spain for making barilla, but is reckoned inferior to S sativa, which grows on the Spanish shores of the Mediterranean, and affords all the best soda consumed in Europe It is called by us Spanish or Alicant soda In September, the crop is cut and laid in small heaps to dry These heaps are then collected and burned, forty or fifty of them in a hole, in the ground

Soda is in common use in the manufacture of glass and soap, with sulphuric acid, it forms Glauber's salts, with marine acid, common salt; with the salt of Homberg, borax, and with cream of tartar, Rochelle salt.

610. *Kochia.* A genus divided from Salsola by Roth, and named by him after his friend Koch, a German botanist.

History, Use, Propagation, Culture,

611 *Chenopodium* From χην, a goose, and πους, foot, many species having large angular leaves extremely similar to the webbed feet of a water-fowl This is a genus of succulent herbs, with their leaves for the most part covered with powdery granules, the whole plant of no beauty, but generally edible as a pot-herb

C Bonus Henricus is cultivated in some gardens as a perennial spinage, it being hardy and of early growth The leaves are sometimes applied to wounds, and for cleansing old ulcers

C album is the most common of the species, and used to be boiled and eaten as greens, but *C. maritimum* is preferred to all the species for this purpose The foreign species are of the easiest culture, and increased either by seeds or cuttings

C maritimum, where it abounds, is burned with Salsola kali and other marine plants, to produce soda

612 *Beta* From *bett*, red, in Celtic B vulgaris, *Betterave*, or beet-radish, Fr , *Rothe Rübe*, Ger , and *Barba Bretiola*, Ital , is a well known culinary root, used in salads either raw or boiled; forming a beautiful garnish, very much used as a pickle, preserved as a confiture, made a substitute for coffee, and yielding a

3408 Hoary, Leaves linear flat, Calyxes about 3 downy with opened obovate appendages
3409 Leaves linear somewhat fleshy pubescent, Flowers axillary about 3 together, Cal with blunt appendages
3410 Herbaceous very hairy, Leaves linear fleshy, Dorsal spine of cal straight
3411 All woolly, Leaves linear fleshy spreading, Cal in fruit stellate with 5 prickles hooked at end
3412 Branches diffuse, Leaves lanceolate silky, Calyxes not prickly
3413 Pubescent, Leaves linear lanceolate ciliated, Cal in pairs, Appendages very short acute

§ 1 *Leaves flat angular*

3414 Leaves triangular hastate entire, Spikes compound clustered leafless axillary and terminal
3415 Leaves triangular toothed, Racemes clustered very upright close to the stem very long and leafless
3416 Leaves rhomboid-ovate and lanceolate the lower sinuate toothed, Pan axillary branched, Stem erect
3417 Leaves cordate triangular rather obtuse toothed, Racemes erect compound leafy shorter than the stem
3418 Leaves ovate unequally toothed acute, Racemes branched naked and simple stem erect
3419 Lvs ov uneq tooth acute shining, Race corym naked shorter than the leaf, Stem branched spreading
3420 Lvs. triangular ovate obsoletely toothed the younger powdery, Racemes clustered shorter than leafstalk

3421 Leaves triangular acute repand toothed, Racemes axillary erect nearly leafless, Bractes minute inflexed
3422 Leaves deltoid sinuate toothed rugose smooth uniform, Racemes terminal
3423 Leaves hastate sinuate eroded entire behind, Upper oblong entire, Seeds dotted
3424 Leaves rhomboid ovate eroded entire behind, Upper oblong entire, Seeds smooth
3425 Leaves ovate-acuminate subcordate angular toothed, Racemes panicled naked terminal and axillary
3426 Leaves oblong sinuated, Racemes naked multifid, Upper bractes entire lanceolate
3427 Leaves ovate acute entire, Stem erect, Racemes cymose elongated nearly leafless
3428 Leaves oblong sinuated, Racemes naked many-cleft, Upper bractes 3-lobed at end
3429 Leaves pinnatifid, Segm linear the lower toothed, Clusters of flowers axillary sessile
3430 Leaves lanceolate remotely toothed, Racemes leafy simple

3431 Leaves ovate lanceolate sparingly toothed, Spikes simple slender long leafless, Flowers trigynous
3432 Leaves oblong sinuate-toothed wedge-shaped at base, Clusters of flowers axillary
3433 Leaves oblong repand glaucous beneath, Spikes clustered simple naked axillary and terminal
3434 Leaves thick rhomboid-angular somewhat sinuated entire behind, Racemes erect compound leafy

§ 2 *Leaves flat entire*

3435 Leaves rhomb-ovate, Flowers clustered axillary
3436 Leaves ovate, Stem decumbent, Cymes dichotomous leafless axillary
3437 Leaves ovate obtuse entire, Panicle terminal naked elongated, Stem simple erect
3438 Cauline leaves lanceolate obtuse, Branch-leaves oblong, Peduncles lateral solitary 1-flowered
3439 Leaves ovate lanceolate acute entire, Racemes axillary compound naked, Stem divaricating
3440 Leaves lanceolate fleshy entire, Corymbs dichotomous aristate axillary
3441 Leaves ovate sinuate, Racemes leafy simple
3442 Leaves wavy half-round, Flowers axillary sessile

§ 3 *Leaves rounded*

3443 Stems diffuse, Leaves oblong & rounded, Flowers axillary clustered
3444 Erect shrubby, Leaves semicylindrical obtuse blunt

3445 Quite smooth, Branches panicled erect, Leaves filiform acutish, Flowers in threes stalked
3446 Herbaceous nearly erect, Leaves linear fleshy unarmed, Cal succulent transparent
3447 Leaves rounded thick smooth terminated by a straight long bristle

3448 Flowers clustered, Lower leaves ovate, Root fleshy
3449 Flowers clustered, All the leaves linear-lanceolate, Branches divaricating
3450 Leaves with very thick ribs, Flowers three together, Root scarcely any
3451 Racemes erect panicled leafless, Flowers trigynous twin and solitary, Lvs cordate acute unequal at base
3452 Flowers in pairs, Stem diffuse, The branches much interwoven, Root scarcely any

3453 Leaves alternate stalked ovate acute with the veins and nerves purple

and Miscellaneous Particulars

sugar equal to that of the cane There are several varieties, those most esteemed for salads are the small red and Castelnaudary, and for extracting sugar, the green-topped The seed is sown in March or April, on deep well comminuted soil When the plants show two or three proper leaves they are thinned out, so as that each plant may occupy or be allowed a square foot of surface By September or October the roots are fit for use, and may either be taken up as wanted, or taken up and buried in sand in the root-cellar

B Cicla, (Cicla is said by De Théis, to be a corruption of *sicula*, under which name it is spoken of by Catullus,) *Bette*, or *Poirée à cardes*, Fr ; *Mangold Kraut*, Ger , and *Buttola*, Ital , is employed in horticulture as a spinage plant, and for being used as chard or asparagus, and in foreign agriculture for the production of sugar. It is much grown in the south of Germany and Switzerland, where the lamina of the leaves is used as spinage or put in soups, and the midrib is boiled and eaten with melted butter or gravy as chard The culture is the same as for the red beet, but, as the leaves are larger, the space allowed each plant is proportionally increased.

B maritima is or may be used as a spinage plant or as greens.

613. *Bosea.* Ernest Gottlieb Bose, a German, published at Leipsig, in 1775, a work upon the secretions of

History, Use, Propagation, Culture

plants. Another Bose (Caspar) was a professor of botany at Leipsig, where he published, in 1728, a dissertation upon the motions of plants Ripened cuttings root freely in sand under a hand-glass, without heat.

614 *Herniaria* From *hernia*, a rupture, for which disorder it was formerly imagined to be a cure, but has long since been rejected even by the herbalists H fruticosa is well adapted for growing in pots or for rock-work, and is readily increased by seeds or cuttings, cuttings of the greenhouse species root freely under a hand-glass

615 *Ulmus.* From *Elm*, its name in Anglo-Saxon, Teutonic, Gothic, and nearly all the dialects of Celtic. This is a genus of hardy trees, most of them valued for their timber The species, like those of the genus Salix, are so nearly related as to be often confounded. Linnæus considered all the European elms as forming only one species The U campestris and glabra are those most generally cultivated in Europe U. campestris grows also in Palestine, and Dr Walker conjectures that it was originally brought from that country by the Crusaders. It is a tall elegant tree, but produces much less valuable timber than the U. glabra. U suberosa, often called the Dutch elm, is frequently grafted on the U glabra, as is also the U campestris in the Scotch nurseries.

616. *Planera.* In honor of John James Planer, a German botanist, who published in 1788 an Index Plantarum Agri Erfordiensis, in one volume 8vo A genus closely related to Ulmus, from which it is perhaps scarcely distinct.

617 *Phyllis.* From *φυλλον*, a leaf. the plant is remarkable for the beauty of its leaves. Phyllis, who was

3454 Smooth, Clusters many-flowered
3455 Hairy, Clusters few-flowered
3456 Leaves obovate acute hairy, Flowers clustered 4-cleft hispid, Stem shrubby
3457 Smooth, Stem erect dichotomous, Leaves ovate cuspidate, Flowers terminal and axillary
3458 Half shrubby, Leaves ovate oblong hoary, Calyxes hairy
3459 Clusters few-flowered hairy, Root thick woody

3460 Leaves doubly serrate unequal at base, Flowers subsessile clustered 5-andr Fruit smooth
3461 Lvs doubly serr nearly equal at base, Fl subsessile clustered 4-andr Fruit smooth, Bark corky winged
3462 The branches only corky not the stem, Stature little more than that of a man, otherwise like the last
3463 Leaves doubly serrated smooth unequal at base, Flowers nearly sessile 5-cleft, Fruit obovate naked
3464 Leaves doubly serrated unequal at base, Flowers 6-8-andr. stalked, Fruit fringed at edge [at edge
3465 Lvs nearly doubly serr uneq. at base, Axil of veins ben unit by a membr Fls 5-8-andr stalked, Fruit vil
3466 Br. with cork wing here and there on each side, Lvs obl ov by deg ac nrly eq at base, Fr. hairy closely frin
3467 Leaves doubly serrated unequal at base acuminated pubescent beneath
3468 Leaves equally serrated equal at base
3469 Leaves irregularly doubly serrated equal at base with a long point rough above beneath soft downy
3470 Lvs doubly ser uneq. at base, Axil. of veins bearded beneath, Fl. clust. 5-andr Fruit pubes not fringed

3471 Decumbent, Branches smooth, Leaves very small equal at base
3472 Leaves small coriaceous shining shortly serrated ovate oblique at base

3473 Leaves subsessile oblong-cordate subcrenately coarsely toothed emarginate at base, Caps short

3474 Leaves lanc equally serrate equal at base shining, Flowers stalked tetrandrous, Fruit smooth

3475 The only species Leaves lanceolate entire opp 4 inches long, Corymbs axillary

3476 Fruit globose
3477 Fruit twin

3478 Seeds with a very long beak, Leaflets many-cut
3479 Seeds subulate hispid, Flowers radiant, Cauline leaves smooth
3480 Stem scabrous, Leaves decompound smooth, Umbels fascicled with a single leaf

3481 Seeds ovate hispid, Cor of one shape, Stem smooth
3482 Seeds cylindrical hispid, Stem hispid, Joints tumid

3483 Stem striated with tumid joints
3484 Seeds shining ovate subulate, Umbels lateral sessile

3485 Stem hairy decumbent, Leaves bipinnatifid, Umbel simple few-flowered

and Miscellaneous Particulars

turned to a bare tree by the gods for having hung herself for love of the absent Demophoon, became a tree covered with verdure upon receiving in that form the embraces of her lover returned

618 *Coriandrum.* From κορις, a bug, in allusion to the smell of the leaves of the plant. C sativum has been long cultivated, chiefly in Essex, and is considered as naturalized The leaves are strongly scented; the seeds, which are slightly aromatic, are used to cover the taste of senna, and in spices as curry powder, and seasoning for black puddings: also, covered with sugar, as a sweetmeat, formerly they were steeped in wine or vinegar, and then dried, to render them milder

619. *Scandix* A name given by the Greeks to a plant used as an eatable, which appears to be that now called Scandix pecten It is derived from σκιω, to prick, on account of the sharp points of the seeds.

620 *Anthriscus.* The name of a plant resembling Scandix, described by Pliny A. vulgaris bears a near resemblance to the common chervil (Chærophyllum sativum), and being gathered as such, and put into soups, by the Dutch soldiers who were in England in 1745, some of them were poisoned by it

621 *Chærophyllum* An ancient Greek name of the Chervil, derived from χαιρω, to rejoice, and φυλλον, leaf, that is to say a plant whose leaves have an agreeable smell C. sylvestre has poisonous roots; though the leaves are occasionally used as a pot-herb, and are much liked by cows The stems and leaves dye a beautiful green, and the umbels a yellow the plant in a wild state is found only on fertile soils

C sativum is cultivated in gardens for the leaves, which are used in soups and salads. To have a successional supply, sow in February and August in shallow drills from six to nine inches apart.

History, Use, Propagation, Culture,

622 *Eryngium* From the Greek verb ἐρεύγω, to belch Dioscorides positively declares that the plant is a specific for all complaints arising from flatulence These are singular plants, somewhat like thistles in general appearance they are generally of a bluish hue, prickly, and with large involucres, and dry coriaceous leaves E maritimum has long been in esteem as an aphrodisiac, the roots were formerly and are now, in some cases, kept in the shops candied, and formed in Shakspeare's time the kissing comfits of Falstaff The Arabs regard the plant as an excellent restorative, and English grooms often mix the dried plant with the corn they give to stallions in the covering season The virtue is said to reside chiefly in the roots · the tops, Linnæus says, are eaten like asparagus in Sweden

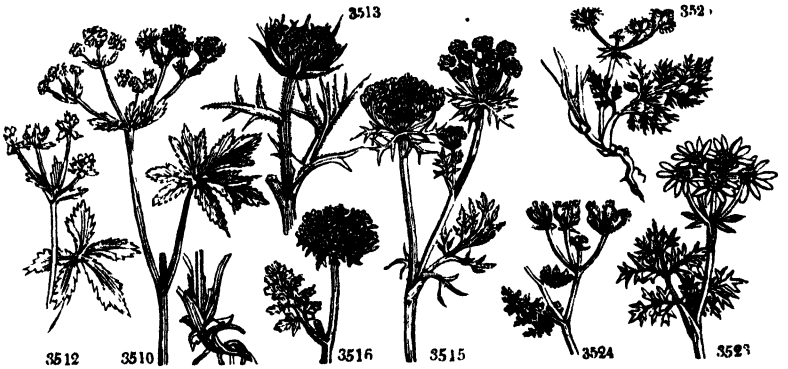
623 *Sanicula.* From *sanare*, to cure This a vulnerary, to which marvellous virtues were formerly ascribed S. europæa used to be considered a powerful vulnerary, but is now wholly rejected in medicine. Sir J Smith says it partakes of that virose acrimony which is found in most umbelliferous plants growing in a moist fat soil

624. *Echinophora* From ἐχῖνος, a hedgehog, and φέρω, to bear In allusion to the strong rigid spines of the

3486 Stem smooth with tumid joints, hairy at base
3487 Stem scabrous, joints tumid
3488 Stem equal, Leaflets cut acute, Fruit with two awns
3489 Stem equal, Leaflets cordate serrate entire, Fruit with two awns
3490 Leaves ternate smooth, Radical leaflets about 3-lobed, Cauline rhomb. ovate cut finely serrate

3491 Stem above smooth, Joints tumid, Leaves biternate pubescent, Styles persistent
3492 Stem equal, Leaves supra-decompound, Involucres colored
3493 Stem equal, Leaflets cut, Seeds furrowed colored awnless

3494 Radical leaves lanceolate serrate, floral many cut, Stem dichotomous
3495 Leaves gladiate serrate spiny, Flowers undivided, Stem simple
3496 Leaves linear-lanceolate ensiform very long, Leaflets reflexed and paleæ trifid, Heads panicled
3497 Leaves all ovate cordate on very short stalks toothed, Stem virgate colored upwards
3498 Radical leaves oval flat crenate, Heads stalked
3499 Radical leaves oblong cut, Stem dichotomous, Heads sessile
3500 Radical leaves cordate cauline palmate with the auricles reflexed, Paleæ tricuspidate
3501 Rad lvs obl lanc toothed spiny, Stem trichotomous, Lvs of involucre entire larger than the heads spiny
3502 Radical leaves roundish plaited spiny, Heads stalked, Paleæ 3-toothed
3503 Radical leaves stem-clasping pinnate lanceolate
3504 Leaves sessile digitate spiny very small, Stem slender and weak dichotomous, Heads sessile
3505 Radical leaves trifid at the base somewhat pinnate
3506 Rad lvs cordate obl. obt cren lobed, Branches col. Lvs of the involucrum very long stiff pungent entire
3507 Leaves palmate cut, Bractes stiff pinnatifid pungent, Stem thick
3508 Radical leaves cordate · cauline ternate cut, Involucres spiny pinnated ciliated
3509 Radical and cauline leaves alternate 3-parted twice trifid, Involucres subulate many-leaved spiny



3510 Lower leaves palmate, Lobes trifid cut-serrate, Florets all sessile
3511 Leaves all compound subternate, Leaflets ovate attenuate at base mucronate serrate, Florets all sessile
3512 Leaves all digitate, Leaflets oblong cut-serrate, Male flowers numerous stalked

3513 Leaflets subulate prickly entire
3514 Leaflets cut unarmed

3515 Seeds hispid, Stalks nerved beneath

3516 Fruit hispid with compressed bristles, Leaflets dilated rounded fleshy hairy, Umbels in fruit convex
3517 Seeds hispid, Central floret sterile fleshy, Common receptacle hemispherical
3518 Leaves shining, Stem hairy, Leafstalks smooth, No sterile central floret
3519 Stem rough simple, Lvs bipinn Leaflets rather whorled many-cleft rigid, Bristles of fruit hairy purple
3520 Rays of the involucre flat, Segments recurved
3521 Fruit large very prickly
3522 Stem and lvs. bipin vil Leafl ovate lobed toothed, Involucres very broad, Prickles of fruit dilated at base

3523 Involucres each 5-leaved, One leaflet twice as large as the others
3524 Umbels trifid leafless, Umbellules 3-leaved 3-seeded
3525 Universal umbel trifid, partial 5-seeded, Leaves pinnated serrated
3526 Universal umbel about 5-cleft, partial 3-seeded, Leaves supra-decompound, and decumbent stem villous
3527 Umbels spreading, Partial leaflets supra-decompound cut with linear segments, Fruit woolly
β Fruit bristly
3528 Universal involucre about 3-leaved, Umbel trifid, Involucels 3-leaved
3529 Common involucre scarcely any, Umbel bifid. Involucres 5-leaved

and Miscellaneous Particulars

involucrum, and indeed of the whole plant. Very much like an Eryngium, once said to have been found in England

625 *D ucus* From δαιω, to make hot, on account of its effects in medicine D Carota (from *Kar*, red, in Celtic), is well known for its esculent root There are several varieties the largest, and that best adapted for field culture, is called the Altrincham, from a village of that name in Cheshire The early horn and orange are the best garden sorts The seeds do not retain their vegetative powers more than a year, for which reason the cautious cultivator ought to prove them before sowing The last week of March and first of April is the best season for sowing for a main crop On farms where a deep sandy loam occurs, few crops of the root kind afford a more valuable return In Norfolk and Suffolk they are a good deal in use as a field crop, and especially near Lowestoft in the latter county

626 *Caucalis* According to Linnæus, derived from καω, to trail along, on account of the low habit of the plants. It is supposed that Pliny's Caucalis was the same as the Caucalis grandiflora of the present day.

History, Use, Propagation, Culture,

627. *Torilis* A name contrived by Adanson and adopted by Gærtner, and other botanists It probably, like many of Adanson's words, has no meaning

628 *Oliveria* Named in honor of G A Olivier, a French botanist, who travelled in the East. He published a splendid work on insects, by which he is better known than by his botanical merits

629. *Ledebuna* So named by Professor Link, after M. Ledebure, the author of a Catalogus Horti Dorpatensis, published in 1819, in which work this plant stands as Tragium tauricum

630 *Myrrhis.* This plant has been long in cultivation Formerly the young leaves were put into salads, and the roots were boiled and eaten cold, or in tarts, and in a variety of sauces, or candied The seeds are put into soups in Germany, and in the north of England employed in polishing and perfuming oak floors and furniture.

631. *Bunium* From βωνος, a hill, because the plant grows in dry and elevated situations. *Terre Noix*, Fr, *Erdnuss*, Ger., *Castagno di terra*, Ital. The roots of B Bulbocastanum are or used to be dug up and eaten raw by the poorer classes They are farinaceous, sweet, and supposed to be very nourishing. Swine are very fond of them, and will soon become fat by feeding on them

632. *Œnanthe.* From οινη, a vine, and ανθος, a flower The Œnanthe, says Pliny, smells like the vine in flower, and it is from that that it takes its name. This genus, like most of the aquatic umbelliferæ, is chiefly poisonous. Œ. crocata is considered eminently so The juice of the root or an infusion of the leaves is very efficacious in cutaneous diseases in large doses it produces a fatal tetanus The herb is applied in poultices to those ulcers that form in the cleft of the hoof of kine.

3530 Involucres many-leaved, Seeds ovate, Styles reflexed, Leaves decompound, Outer leaflet lin. lanceolate
3531 Universal involucre scarcely any, Seeds ov Styles reflexed, Leaves decompound, Stem much branched

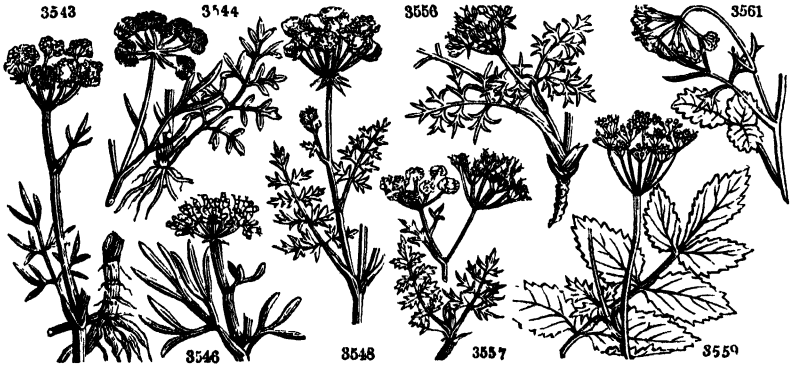
3532 Umbels simple subsessile, Leaves supra-decompound

3533 Leaves pinnate, Leaflets sessile 3-5-cleft, Segm 3-fid ciliated, Flowers fascicled villous

3534 Radical leaves pinnate, Pinnæ ovate serrated cut, The upper 3-pinnatifid with linear 3-forked segments

3535 Villous, Leaves ternate decompound, Leaves ovate lanceolate pinnatifid, Central fl. male

3536 Leaves uniform, Involucre many-leaved



3537 Seeds somewhat muricated, Peduncles furrowed, Leaflets channelled obtuse

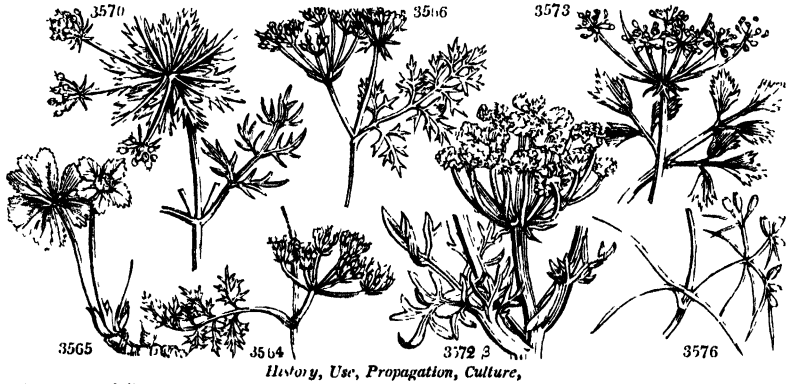
3538 Stoloniferous, Cauline leaves with filiform fistulous pinnæ
3539 All the leaves many cut obtuse nearly equal
3540 Outside stalks of the umbels longest branched male
3541 Leaves bipinnate, Fruit globose
3542 Leaves bi-tripinnate, the upper pinnate, Leaflets wedge-shaped cut serrate striated
3543 Cauline leaves pinnate, radical bipinnate, Leaflets linear
3544 Radical leaves caudate split cauline entire very long simple
3545 Lower pinnæ of the leaves ovate, upper linear, Stalks angular

3546 Leaflets lanceolate fleshy
3547 Leaflets wedge-shaped split (*Tenoria*, Spr.)

3548 Leaves bipinnate flat, Umbel hemispherical, Seeds hairy
3549 Leaves pinnate decussate cut angular, Seeds naked
3550 Leaves pinnate cut angular
3551 Leaves subpinnate, Leaflets imbricated downwards, Umbel lens-shaped
3552 Pubes hoary, Lvs supra-decompound, Leaflets wedge-shaped 4-toothed, Umbel with many rays globose
3553 Leaflets divaricating, Leaves thrice pinnate
3554 Lower leaves shining, First umbels subsessile, Seeds hairy
3555 Leaves capillary, Styles persistent erect, Seeds oblong hairy
3556 Leaflets linear flat hairy, Petals divided, Seeds oblong hairy
β Leaves many-parted, Segm linear rounded acuminated

3557 Stem furrowed smooth, Leaves pinnated smooth · radical roundish finely toothed, cauline linear
3558 Stem furrowed pubescent, Leaves pinnate pubescent radical cordate cut obtuse toothed, cauline linear
3559 Leaves all alike pinnate, Leaflets lobed, the odd one 3-lobed
3560 Leaves pinnate, Pinnæ many-parted, Segments falcate acute
3561 Radical leaves pinnate crenate, upper wedge-shaped cut, Umbels nodding
3562 Radical leaves trifid cut
3563 Peduncles opp the leaves, Flower leaves bifid or trifid, Leaf-stalks winged membranous

and Miscellaneous Particulars



633 *Crithmum*. From κριθη, barley Its seed is very similar to a grain of barley. *Saint Pierre*, Fr., *Meerfenchel*, Ger, and *Finocchio marino*, Ital. The C maritimum is found on stone walls, as well as by the sea shore The inhabitants, where it abounds, not only use it as a pickle, but as an ingredient in salads, and as a pot-herb In the garden it may be grown on beds of sand and rubbish, or in pots. Braddick, an ingenious horticulturist, cultivated it at Thames Ditton, in a sheltered dry situation screened from the morning sun he protected it by litter during winter, and in spring sprinkled the soil with a little powdered barilla. "This I do," says he, "to furnish the plant with a supply of soda, since in its native place of growth it possesses the power of decomposing sea water, from which it takes the fossil alkali, and rejects the muriatic acid" With this treatment it flourished abundantly, producing an ample supply of leaves and shoots, which were cut twice in the season (*Hort Trans* ii 232)

634 *Athamanta* A plant found upon Mount Athamas in Thessaly, as some say; others, however, believe it to have been named after King Athamas, a king of Thebes, who first brought it into use.

635 *Pimpinella* According to Linnæus, this name has been altered from *bipennula*, twice pinnate, in allusion to the leaves P saxifraga differs surprisingly in size and foliage in different situations, insomuch that some make several species, as P. minor, major, and dissecta The root is acrid, and used as a masticatory in tooth-ache, also externally to take away freckles, and in gargles to dissolve viscid mucus

P. anisum (*ānyσον*, Arabic, *Golsus*) is cultivated in Malta and Spain, whence the seeds are annually imported into England for their use in medicine. They are aromatic and carminative, and yield an oil both by distillation and expression, which is much used in flatulencies, as are the seeds in substance The oil is also

History, Use, Propagation, Culture,

used by vermin-killers to scent poisonous baits, or to neutralize or obliterate other smells. Anise is sometimes sown in gardens for the leaves, to be used as a garnish, or for seasoning, like fennel

636 *Phellandrium* A name under which Pliny describes an umbelliferous plant, of similar nature to the one now so called In running streams the leaves of this plant become divided, like those of Ranunculus aquatilis in the same situation When the plant grows in an angle, out of the rapid course of the stream, it produces its flowers, but it flowers best on the muddy banks of ditches and ponds According to Linnæus it renders horses paralytic, the disease being brought on by a Coleopterous insect, the Curculio paraplecticus, which breeds in the stalks, and is cured by pigs' dung The seeds are sometimes used in agues

637 *Dondia* A curious little plant resembling Astrantia, and named from Dondie Duprée, a French botanist

638. *Trachyspermum* From τραχυς, rough, and σπερμα, seed; on account of the roughness of the seeds Nearly related to Ammi, with which it agrees in habit

639. *Ammi* From αμμος, sand, because it grows in sandy places Plants with a delicate habit, very finely cut leaves, and white flowers

640. *Bubon.* *Bubonion* is a name of Pliny's, now applied to this plant, as Pliny's was used in medicine, so is this, and there the resemblance ceases B macedonicum is put among clothes to scent them, in some parts of the East From B Galbanum (derivation obscure) the drug of that name is obtained, though it is not clear that it may not also be got from other species. It is collected from the spontaneous exudation of the

3564 Ramifications of leaves divaricating

3565 Leaves stalked digitate 3-lobed, Scape angular with only one umbel

3566 Leaves supra-decompound, Leaflets filiform, Umbels opp the leaves, Leaves of involucre unequal

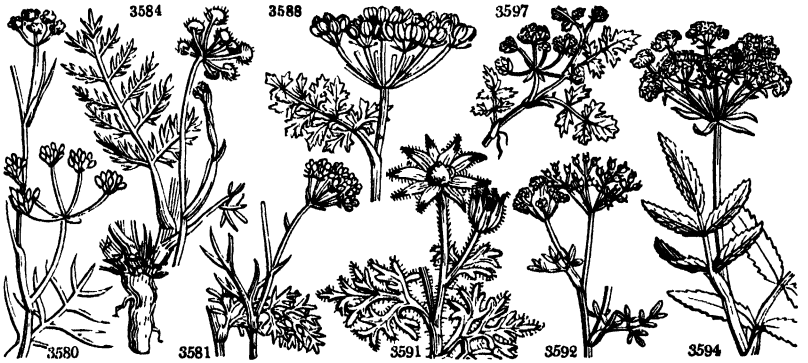
3567 Universal umbel united at base
3568 Lower leaves pinnate lanceolate serrate, upper multifid linear
3569 Segments of all the leaves lanceolate
3570 Leaves supra-decompound, Leaflets 3-parted pinnatifid

3571 Leaves rhomb-ovate cut-toothed, Teeth acuminate, Umbels numerous, Seeds hairy
3572 Leaflets linear

3573 Leaflets ovate wedge-shaped acute finely serrate, Umbels few, Seeds smooth, Stem glaucous
3574 Leaflets lanceolate very obtusely and obscurely crenate, Seeds smooth
3575 Leaflets cut acuminate lower broadest, Seeds smooth

3576 The only species Lower leaves broad, Upper capillary

3577 Stem declinate, Umbels nodding
3578 Stem erect flexuose, Leaves decompound very fine, Umbels dense very downy
3579 Leaf-stalks branch-bearing membranous oblong entire, Cauline leaves very narrow
3580 Leaf-stalks branch-bearing membranous obl entire, Leaflets single and two together channelled smooth
3581 Radical leaves with imbricated leaflets
3582 Stem tall rigid, Leaflets linear fascicled
3583 Stem procumbent branched, Leaves bipinnatifid shining, Involucels halved
3584 Involucels connate one-leaved
3585 Stem ascending, Leaves triternate very fine, Umbel nodding with long rays
3586 Stem elongated with callous points, Leaves bipinnate, Pinnæ linear distant



3587 Leaflets toothed villous united at base
3588 Leaflets many-cut narrowed at base
3589 Leaves digitate, Leaflets bipinnate finely many-cut
3590 Leaves bipinnate, Leaflets pinnatifid, Segm lanceolate

3591 Downy, Leaves decursively pinnated, Invol soft long with 10-18 rays

3592 Seeds rough with sharp ribs

3593 Seeds smooth with blunt ribs

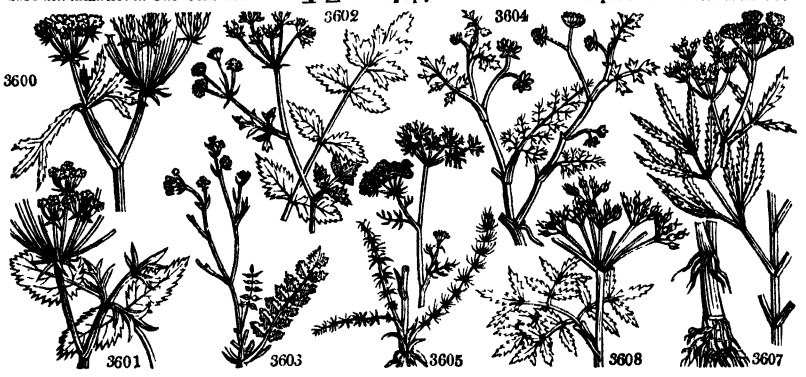
3594 Leaves pinnate, Umbel terminal
3595 Leaves pinnate, Umbels axillary stalked, Common invol pinnatifid
3596 Leaves pinnate, Umbels axillary sessile
3597 Stem creeping, Leaflets roundish toothed angular
3598 Leaves pinnate floral ternate

and Miscellaneous Particulars

stem, or by an incision in the stalk a little above the root, from which it immediately flows, and soon becomes sufficiently concreted for gathering Medicinally considered, this gum-resin is said to hold a middle place between Asafœtida and Ammoniacum, but it is far less fœtid than the former

641 *Cuminum* From the Arabic name of the plant *qamoün.* (*Golius*) This is a dwarf fennel-looking plant, cultivated in the south of Europe and lesser Asia for its seeds, which are hot and aromatic, and used like those of Anise, Caraway, &c

642 *Seseli* Golius (p. 167) says, a plant related to this is called *Seycêlyous* in Arabic. There is also a Greek σεσελι



643 *Thapsia* The Thapsia, says Dioscorides, derives its name from the isle Thapsus, where it was first discovered. Plants resembling Smyrnium in habit

644 *Actinotus* From ακτιν, a ray, in allusion to the ray-like appearance of the involucrum Curious New Holland plants with the habit of Astrantia

645 *Trinia.* Named by Hoffmann after Dr Trinius, a celebrated Russian botanist, who has published some works upon grasses Plants resembling Pimpinella in appearance

646 *Sium* *Siw* signifies *water* in Celtic. This is a genus of aquatic plants S. nodiflorum bears a good deal of resemblance to the water-cress (Nasturtium officinale), and, unless when in flower, is not very easily distinguished from it by the inexperienced. It is commonly considered poisonous, though, according to Dr

History, Use, Propagation, Culture,

Withering, the juice, in doses of from two to four ounces, either alone or with milk, every morning, is an excellent alterative in cutaneous diseases

S sisarum (from *Dgizer*, its Arabic name, in which language it signifies *carrot*), *Chervis*, Fr, *Zuckerwürtzel* Ger, and *Sssaro*, Ital, is cultivated for its roots or tubers, which, boiled and eaten with butter, are sweet and agreeable A crop may either be raised from seed or offsets, if from the former, sow in March or the beginning of April, and when the plants come up, whether in rows or broadcast, thin them, so as nine or ten square inches may be allowed to each plant With the usual summer culture the roots will have attained their full size in September, and may be taken up as wanted for use In growing from offsets, allow about the same distance planting about the end of April, and giving the usual culture afterwards

647 *Sison* From the Celtic *sizun*, which signifies a running stream Many of the plants grow in such situations This genus is called Honewort, from its being used formerly to cure a swelling in the cheek called the Hone

648 *Cicuta* A word used by Virgil (*Ecl* 2 and 5), but of unknown meaning C virosa is poisonous to mankind and kine, but not to horses, sheep, or goats, the smell being weak in the spring, cows are apt to be killed by it, but afterwards the odour enables them to avoid it. C maculata is used in medicine like Conium maculatum

649 *Conium* Said by Linnæus to be derived from κονις, powder, dust, but the application of the term is not evident C maculatum is a well known poisonous plant, lately admitted into the Materia Medica. According to Linnæus, sheep eat the leaves, but horses, cows, and goats refuse them Ray informs us, that the thrush will feed upon the seeds, even when corn is to be had Curtis says hemlock is eaten by few or no insects The dried fistulous stalks of this and several other umbelliferous plants are called by the country people kecksies As a medicine, hemlock seems to act on the constitution in a great measure like opium

650. *Smyrnium* Σμυρνα, is a synonym of μυρρα, myrrh Its juice smells like myrrh, saith Pliny *Maceron*, Fr, *Smyrnerkraut*, Ger, and *Macerone*, Ital S perfoliatum and olusatrum are or may be cultivated as Asparaginous and salad plants, though they are now almost entirely supplanted by the celery, which they somewhat resemble in flavour The seeds are sown in March in rows two feet apart, and afterwards thinned out to six inches As the plants advance, they are earthed up like celery, and, like it, are ready for use during autumn and winter. Olusatrum is from *olus*, pot-herb, and *atrum*, black, from the dark colour of its foliage Our English name, Alexanders, is certainly a mere corruption of Olusatrum

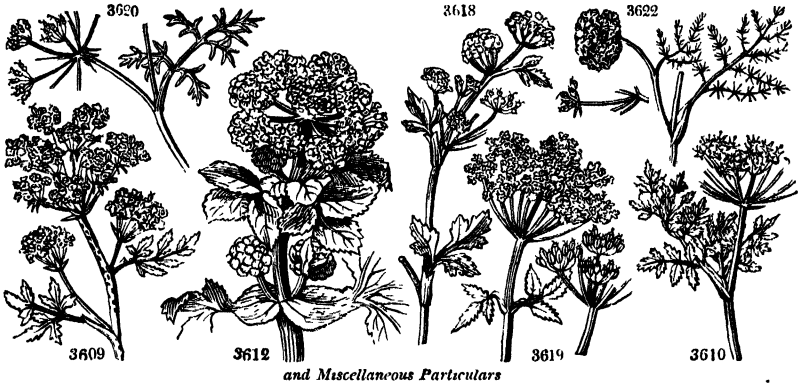
651. *Apium* From *apon*, water, in Celtic, from the place where the plant grows A. Petroselinum, (*πετρα*, stone, and *selinum* — Stone Selinum) *Persil*, Fr, *Peterselie*, Ger, and *Petroselina*, Ital, is a well known seasoning herb, and it is also sown among pasture grasses as likely to counteract the liver rot in sheep There is a variety called the Hamburgh or large rooted parsley, which is cultivated for its roots, which, as well as the

3599 Leaves pinnate, Leaflets lanceolate nearly entire
3600 Leaves linear decurrent connate
3601 Radical leaves ternate; cauline bipinnate

3602 Leaves pinnate, Umbels erect
3603 Leaves pinnate, Umbels cernuous
3604 Creeping, Umbels bifid
3605 Leaflets whorled capillary
3606 Rad lvs compound, Leaflets whorled fascicled lanc Stem leafless, Umbellif branches dichotomous

3607 Umbels opp to the leaves, Leaf-stalks edged obtuse
3608 Serratures of leaves mucronate, Leaf-stalks membranous two-lobed at end

3609 Seeds unarmed, Stem branched shining spotted
3610 Seeds muricated, Petioles and peduncles smooth



3611 Cauline leaves simple stem-clasping
3612 Cauline leaves ternate stalked serrate
3613 Cauline leaves wedge-shaped obtuse trifid toothed
3614 Radical leaves simple cordate crenate, cauline ternate serrate, Umbels terminal

3615 Leaves pinnate serrate, All the florets fertile
3616 Cauline leaves doubly ternate entire

3617 Cauline leaves linear with minute involucres
3618 Cauline leaves wedge-shaped

3619 Upper leaves ternate, Lower biternate sessile

3620 Stem diffuse branching, Radical leaves broad, cauline very narrow
3621 Stem simple, Sheaths of leafstalks dilated membranous, Leaflets multifid pinnatifid
3622 All the leaves very finely cut

and Miscellaneous Particulars

roots of the other varieties, communicate an agreeable flavor to soups and stews The curled thick-leaved variety is that most esteemed for soups and as a garnish it is sown in drills, and should be thinned out when it is so far advanced as to shew the finer curls of the leaves It is too commonly left to grow as it came up which makes it but a very inferior article for garnishes The Hamburgh sort should be thinned so as each plant may occupy ten or twelve square inches of surface

A graveolens is one of our most valuable salad plants, and is a remarkable instance of the effect of cultivation, being in its wild state, rank, coarse, and unfit to eat, and blanched in the garden, sweet, crisp, juicy, and of a most agreeable flavor The green leaves are used in soups, and in Italy and the Levant, where the plant is grown, but not blanched, this is its principal application Here both the leaves and seeds are used in soups and stews, and the blanched stalks in that way and also as a salad, either alone or in composition. One variety, the Celeriac, is grown entirely for the root or base of the leaves, which assumes a bulbous form, is solid and white, and used either in soups or as a salad

In order to produce excellent celery, a deep rich light soil is required, and especially a soil on a dry bottom The seed in the main crop is commonly sown in the beginning of April on a bed for transplantation, the plants so raised are commonly pricked out into other beds, and placed four or six inches asunder At eight or twelve inches height the plants so brought forward are transplanted into trenches for blanching These trenches are small open ditches of from six inches to a foot deep, and they are dug from two and a half to three feet apart from each other, in order to admit of earthing up the plants to the height of two feet or more above the natural surface The excavated earth is laid in the intervals, and some dung is dug into the bottom of the trenches. Along these the plants are inserted at four or five inches apart, and as they grow, the earth from the sides of the trenches and from the wide intervals between them is applied to the plants in small layers at a time, till at the end of the autumn the ditches have become banks two or three feet high The celery is now fit to use, and by earlier and later crops this salad is had in perfection from August or September till May following Celery is grown to great perfection in Lancashire, where blanched stalks have been dug up four feet six inches long, and weighing nine or more pounds, of the best quality A variety of modes of cultivating the celery are brought together in the Encyclopædia of Gardening, which well deserve the perusal of those who aim at growing this root in the best manner.

652. *Ægopodium* From αιξ αιγος, a goat, and πους, a foot. Each of the parts of the leaf is split so as to resemble the cloven foot of a goat The leaves of E. Podagraria smell like those of Angelica, and may be eaten in spring salads.

653 *Meum* From μειον, very small, in allusion to the extreme delicacy of the leaves, which are as fine as hairs.

History, Use, Propagation, Culture.

654 *Anethum.* From ἀνήω, to burn, the plant being very heating Large quantities of the seeds are yearly imported into this country from the south of France They are used in medicine as carminatives, and, as it is said, in the manufacture of the British gin No one has succeeded in growing the plant for a crop in this country

655 *Carum* A native of Caria, according to Pliny, b xix c 8 *Carvi*, Fr, *Kümmel*, Ger, and *Carvi*, Ital C Carvi is cultivated both in agriculture and horticulture in the former for its seeds, which are used to flavor cakes, to form sugar plums, to flavor spirits, and form a carminative distilled water In the culinary art the leaves are sometimes used as an ingredient in salads, or as a pot herb, like parsley; and the roots are said to be superior in flavor to those of the parsnip

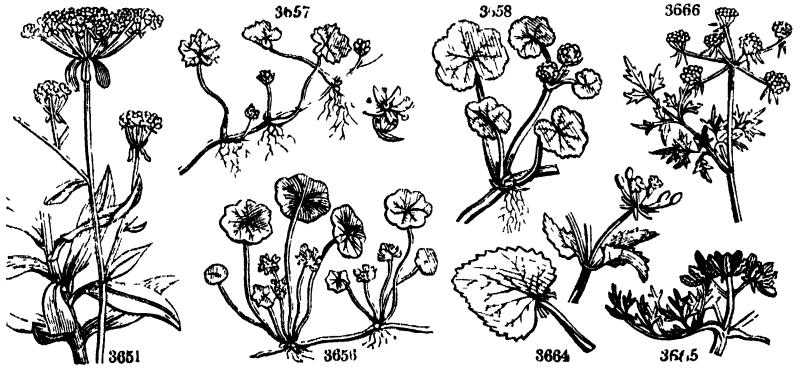
656 *Cnidium* The ancient name of an herb, supposed to have been an Orach, and certainly having no affinity to the plants now called Cnidium

657. *Bupleurum* From βοῦς, an ox, and πλευρον, a rib How applied is not apparent These are plants remarkable among the Umbelliferous tribes for having simple leaves

3623 Fruit compressed
3624 Cauline leaves three, Fruit oval
3625 Leaves supra-decompound, Umbel with 5-15 rays, Fruit obl flat with three ribs at base
3626 Fruit ovate

3627 Stem branched, Sheaths of leaves ventricose, Common involucre O.
3628 Stem quite simple, Sheaths of leaves appressed, Common involucre many-leaved

3629 Umbels close, Comm. involucre reflexed, Seeds with 5 membranous ribs
3630 Leaves thrice pinnated, Pinnules distinct with a nerve lanceolate 3-lobed with an odd one
3631 Leaflets pinnatifid, Segm. trifid bluntish
3632 Leafstalks of the branches somewhat membranous loose entire, Lvs supra-decom Leaflets lanc awned
3633 Leaves doubly pinnate Leaflets cut acute, Involucels bristly longer than the umbel



3634 Common involucres none, Leaves perfoliate
3635 Involucels joined together the universal three-leaved
3636 Involucels about 5-leaved joined together, universal 5-leaved, Caul leaves cord. lanc stem-clasping
3637 Involucels 7-leaved, universal about 3-leaved, Radical leaves linear, Scape one-leaved
3638 Involucels 5-leaved orbicular, universal 3-leaved ovate, Leaves cord lanc stem-clasping
3639 Involucels 5-leaved roundish emarginate con, universal 3-leav cut at base, Lvs lanc cordate stem-clasping
3640 Involucels 5-leaved ovate, universal about 5-leaved, Leaves stem-clasping
3641 Involucels 5-leaved acute, universal about 5-leaved, Leaves lanceolate, Stem flexuose
3642 Stem branched leafy, Lvs lin-lanc chan nerved, Involucels 4-leaved uneq very narrow shorter than umbel
3643 Involucels 5-leaved acute, universal 3-leaved, Central florets tallest, Branches divaricating
3644 Leaves lanceolate, Umbels terminal and axillary, Seeds rough
3645 Involucels 5-leaved lanceolate longer, universal 3-leaved, Leaves cauline lanceolate
3646 Umbels simple alternate 5-leaved about 3-flowered
3647 Stem erect branching, Lvs lin acum Involucels 5-leaved, Involucels 5-leaved lin subul longer than umbel
3648 Stem erect panicled, Leaves linear, Involucre 3-leaved as long as umbel, Involucels 5-leaved
3649 Stem branched leafless, Radical leaves decompound flat cut, Involucres and involucels lanceolate-oblong
3650 Leaves lanceolate obovate entire sessile
3651 Leaves lanceolate narrowed each way entire sessile
3652 Leaves linear, Involucre common and partial
3653 Lvs peren lanc. mucronate nerved, Flowering branches branched striated, Involucre subulate appressed
3654 Branches of panicle sessile naked spiny, Leaves linear
3655 Vernal leaves decompound flat cut, Summer leaves filiform angular trifid

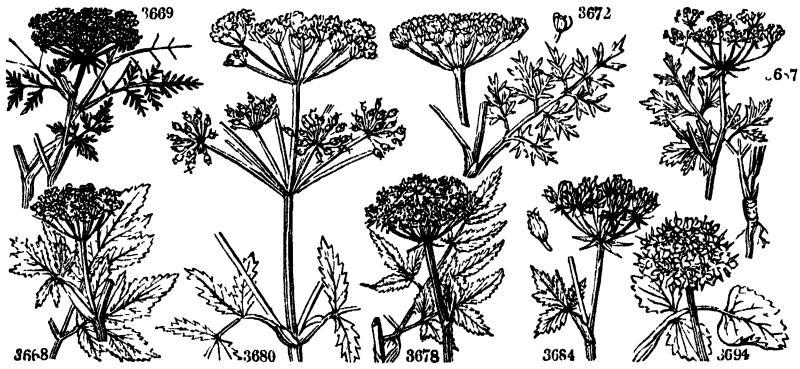
3656 Leaves peltate, Umbels 5-flowered
3657 Leaves orbicular reniform 5-7-lobed, Flowers capitate sessile, Peduncle shorter than petiole
3658 Leaves orbicular reniform 7-lobed crenated, Flowers in numerous heads on short stalks
3659 Root tuberous, Leaves peltate roundish lobed unequally crenate, Clusters subsessile few-flowered
3660 Leaves crenate peltate emarginate at base, Umbels many-flowered and flowers stalked
3661 Leaves cordate reniform equal toothed crenate smooth, Umbels axillary sessile many-flowered
3662 Lvs rounded cordate repand toothed beneath and stalks hairy, Umbels capitate about 3-fl Fruit netted
3663 Stem decumbent and erect branches villous, Lvs ov cordate cuspidate 3-nerved, Umbels axillary sessile

3664 Stem erect smooth, Leaves triangular acuminate crenate bearded at base, Umbels axillary spreading

3665 The only species

3666 Leaves all of one shape
3667 Leaflets very fine whorled. Stem very leafy, Comm involucre many-leaved

and Miscellaneous Particulars.



658 *Hydrocotyle* From ὑδωρ, water, and κοτυλη, vessel, its leaf is round and a little depressed in the centre, so as to hold a drop of water This is a genus of aquatics and marsh plants of no great beauty, their flowers being obscure and of dull colors H vulgaris, the *Wassernabel* of the Germans, has been supposed to communicate the liver rot to sheep This is a vulgar error, arising from the circumstance of the fluke or flounder insect (Fasciola hepatica) being found in marshes where this plant, and also the Drosera and Pinguicula, abound, as well as in sheep's livers It is a known fact, however, that sheep never feed on any of these plants

659 *Spananthe.* From σπανος, rare, and ανθος, a flower, in allusion to the small number of flowers in the umbel.

660. *Ulospermum* From ουλος, curled, and σπερμα, seed, on account of the membranous curled ribs of the seed A plant referred to Conium by Desfontaines, and to Cachrys by Sprengel, but very distinct from both

661 *Æthusa* From αιθω, to burn, on account of its dangerous acridity Æ Cynapium (κυνος απιον, dog-parsley) is a common weed in gardens, and sometimes mistaken for parsley, from which, however, it is easily

History, Use, Propagation, Culture,

distinguished by being of a darker green, a different shape, flat, and not curled, and of a disagreeable smell When eaten in mistake for parsley it occasions vomiting, which may be stopped by a very large dose of brandy It is deleterious to geese

662. *Imperatoria* A metaphorical name given to this plant to express its many virtues. For the same reason the English call it Masterwort The root, which is very acrid, is sometimes used in toothache, and an infusion of it in wine instead of bark in quartan agues

663. *Selinum* From σιλινη, a name of the moon, in allusion to the crescent-like form of the seeds when cut across. The Greeks seem to have used the word *selinon*, with reference to the same plants as we call umbelliferous.

664. *Angelica* So called, in allusion to its agreeable smell and medicinal qualities A archangelica (from αγχυ, superior, an augmentative prefix), is sometimes cultivated in gardens for its leaf-stalks, to be blanched and eaten as celery, or candied with sugar It is considered stimulant and anti-pestilential

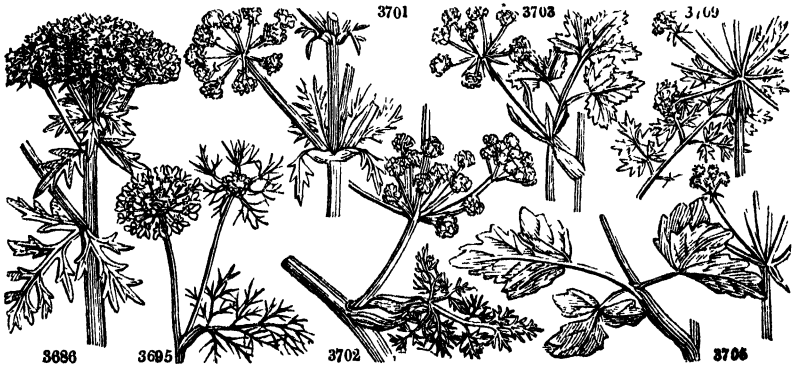
665 *Lagusticum.* This plant, says Dioscorides, grows in great abundance in Liguria, near Mount Appennine, from which circumstance it derives its name L levisticum and scoticum are sometimes used as potherbs or ingredients in salads, and are accounted emmenagogue The root is carminative, and an infusion of the leaves is used as a purgative to calves in the Isle of Sky

666. *Hasselquistia.* So named by Linnæus, in memory of his pupil, Frederick Hasselquist, M D, who

3668 The only species

3669 Stem striated, Root fusiform divided, Rays of umbel hispid
3670 Leaves 3-parted thrice sinuated A doubtful species, scarcely distinct from the next
3671 Stem furrowed, Common involucre many-leaved, Leaflets wedge-shaped cut
3672 Stem furrowed with acute angles, Comm involucre 0, Leaflets lanceolate cut at the end with a callous point
3673 Stem rounded striated, Comm involucre 0, Sheaths of leaves loose, Leaflets filiform linear
3674 Stem rounded striated, Comm involucre 0, Leaflets trifid linear mucronate
3675 Stem striated, Lvs pinnat subcor Leaflets ov -obl at base cartil serrate, Upper sheaths enlarged leafless
3676 Stem woody naked beneath, Lower leaves bipinnate, Pinnæ lanceolate entire and cut serrate

3677 Leaves doubly pinnate ovate lanc serrated with the odd leaflet lobed
3678 Leaflets equal ovate lanceolate serrated
3679 Leaflets lanceolate serrated decurrent
3680 Leaves very much divaricating, Leaflets ovate serrate, Stem with the pedunc\es whorled
3681 Outer pair of leaflets united together, terminal leaflet stalked
3682 Leaflets equal ovate cut serrate



3683 Leaves multiple, Leaflets cut upwards
3684 Leaves biternate
3685 Leaves many times pinnate, Leaflets pinnately cut
3686 Leaves bipinnate, Leaflets confluent cut entire
3687 Leaves decompound cut cauline ternate lanceolate entire, Furrows of seed obsolete
3688 Lvs supra-decompound, Leaflets pinnatifid, Segm linear mucronate, Comm involucre scarcely any deciduous
3689 Lvs supra-decom. Leaflets wedge-shaped cut smooth, Comm involucre 2-leaved leafy, Ribs of seed mem smooth
3690 Involucre of the 1st umbel scarcely any of the lateral umbels membranous at base, Rays branched
3691 Leaves pinnate, Lower leaflets acute with a smaller one
3692 Leaves biternate, radical decompound, Leaflets lin lanc entire

3693 Leaves pinnate, Leaflets pinnatifid
3694 Leaves cordate

3695 Seeds scaly

3696 Leaflets linear very long simple
3697 Leaflets linear subulate rounded, Comm involucre 0
3698 Leaves supra-decompound, Leaflets lanc linear flat
3699 Leaves cut, Segm. 3-toothed unequal shining
3700 Pinnæ of leaves naked at base, Leaflets setaceous
3701 Leaflets with appendages, Umbels nearly sessile
3702 Leaves supra-decompound many cut acute decurrent, First umbel sessile

3703 Leaves obliquely cordate toothed, Teeth mucronate, Wings of seeds crisp
3704 Leaflets 3-lobed cut
3705 Leaves obtuse ovate at base lobed
3706 Leaflets wedge-shaped trifid, Segm oblong bluntish with a callous point at end
3707 Stem naked 3-cornered, Branches angular, Leaflets obl toothed crenate, Involucres many-leaved short
3708 Leaflets lanceolate obtuse mucronate entire sessile
3709 Leaves lanceolate entire the outer joined together

and Miscellaneous Particulars

travelled into the Holy Land, &c and died at Smyrna in 1752 Author of Travels in Palestine. A remarkable genus, supposed with some reason to be a monstrous alteration of a species of Tordylium

667 *Artedia* So named by Linnæus, in honor of Peter Artedi, a Swedish naturalist, one of the first who attempted to divide umbelliferous plants into genera His method was followed by Linnæus, and was, perhaps, not more defective than many of those which have been proposed in modern days He died in 1735

668 *Ferula.* From *ferire*, to strike The stalks were used as a rod for children, because they made more noise than harm F communis is one of the tallest of herbaceous plants The flower-stalk soon becomes dry after the seeds ripen, and then the Sicilians take out the pith and use it for tinder It is very abundant in Apulia, where it is eaten by buffaloes Gerarde says, it grew to the height of fifteen feet in his garden in Holborn The drug asafœtida is obtained from one or more species of this genus natives of Persia, and one species, the F. asafœtida, though introduced to our gardens in 1782, is now lost The drug is the inspissated juice of the root, which being bared of earth and cut across at the top, it oozes out, and when dry, is scraped off as opium is from the capsule of the poppy. The plant grows three feet high, with yellow flowers and hemlock-like leaves and habit

669. *Laserpitium.* The Latin name of the Silphion of the Greeks D'Herbelot says, that the natives of Africa called the plant *silphi* or *serpi*, whence the Latins formed *lac serpitium* and *Laserpitium.* (*Bibl. Or.* p. 493.

History, Use, Propagation, Culture,

670 *Peucedanum* From πευκη, a pine-tree, and δανος, dwarf, a diminutive fir The plant was so called on account of its strong smell, which resembles resin

671 *Pastinaca* One of the names given by the Latins to the *Daucus* of the Greeks. It is derived from *pastus*, nourishment. P sativa is a well known culinary root, and grown also in agriculture for feeding cattle It was much in use during Catholic times to eat with salted fish In the north of Ireland a sort of beer is brewed from the roots mixed with hops, a very good wine is also made from them, and by distillation they yield an ardent spirit, similar to that afforded by the potatoe. The parsnep is much cultivated in Jersey and Guernsey, chiefly for feeding milch cows The variety preferred is called the Coquaine, the roots of which, Dr. Macculloch informs us (*Caled Hort Mem* 1 408), sometimes run four feet deep, and are rarely so small in circumference as six inches The time of sowing is February and March, in drills to admit of stirring the soil between the rows They should be thinned so as that each plant may have a surface of twelve or fourteen square inches, and, with the usual routine culture, the crop will be mature in October They may be taken up and housed like the carrot, or as wanted for use as they are not easily injured by frost, the latter mode is the best, where they are grown only for the table

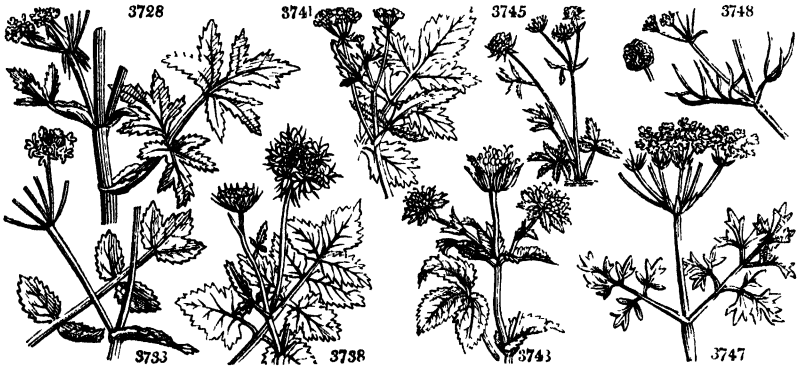
P. opopanax (οπος, juice, παν, all, and ακος, cure. a cure for all complaints) produces from its stem, when it is cut, a gum resin which is a famous cure in the East for all sorts of maladies

672. *Heracleum.* Named after the hero Hercules, who, according to a modern French author, was not only a warrior but a great doctor and botanist. H. Sphondylium (from σφονδυλος, a vertebra, in allusion to the jointed stem), the *Heilkraut* of the Germans, is common in most parts of Europe The seeds smell somewhat

3710 Leaves pinnatifid, Segm lanceolate, Common involucre scarcely any, Stem smooth
3711 Leaflets linear-lanceolate veiny striated distinct
3712 Leaflets oval-lanceolate entire stalked
3713 Leaves supra-decompound linear-subulate smooth, Comm involucre pinnated
3714 Leaflets linear
3715 Hairy, Stem rounded simple, Lvs tern bipinnate, Leaflets alternate ovate pinnatifid cut wedge-shaped
3716 Leaves supra-decompound hairy, Leaflets many cut, Leaves of many-leaved involucre membranous at edge

3717 Leaves 5 times 3-parted filiform linear
3718 Leaves ternate decompound, Leaflets linear obtuse stiffish, Comm involucre scarcely any
3719 Leaves 3-parted filiform longer, Umbels deformed
3720 Leaflets linear branched
3721 Leaflets linear acute, First umbels sessile
3722 Leaves thrice pinnate, Cauline leaflets linear lanceolate · radical oblong many-cut

3723 Leaves simple cordate lobed shining acutely crenate
3724 Leaves simply pinnate
3725 Leaves pinnate, Leaflets with their front base cut out
3726 Stem rounded rough branched, Leaves bipinnatifid, Peduncles rigid villous



3727 Leaves pinnate, Leaflets 5 oblong pinnatifid acute toothed, Cor of one shape
3728 Leaves pinnate, Leaflets 5 oblong pinnatifid acuminate toothed rough at edge, Flowers radiant
3729 Leaves cruciate pinnate, Leaflets linear, Corollas floscculous
3730 Leaflets pinnatifid crosswise toothed
3731 Leaves pinnated, Leaflets 5 the intermediate sessile, Cor of one form
3732 Leaves pinnated, Leaflets 5 the intermediate sessile, Flowers radiant
3733 Leaves pinnated rugose on each side scabrous, Flowers somewhat radiant
3734 Leaves simple cordate obsoletely lobed serrated
3735 Leaves simple 3-leaved cordate toothed beneath pubescent
3736 Leaves simple and ternate many cut torn, Segments linear

3737 Involucres longer than the umbels
3738 Partial involucres the length of flowers, Leaflets ovate laciniate
3739 Seeds furrowed wrinkled plaited, Universal involucre 1-leaved trifid
3740 Umbellules remote, Leaves pinnated with roundish cut pinnæ
3741 Umbels clustered radiant, Leaflets lanceolate cut serrated
3742 Umbels clustered radiant, Leaflets angular toothed pubescent

3743 Radical lvs. palmate 3-lobed unequally twice serrated, cauline sessile lobed, Involucre longer than umbel
3744 Radical leaves 5-lobed, Lobes trifid acute toothed, Involucres bin lanceolate entire
3745 Radical leaves digitate, Leaflets about 7 lanceolate acute deeply toothed
3746 Radical leaves 5-lobed, Lobes oblong acutish trifid mucronate-toothed, Involucres entire

3747 Hoary, Leaves decompound, Leaflets wedge-shaped trifid, Flowers angular, Fruit villous

3748 Stem dichotomous knotty, Leaves decompound, Involucre short, Female flowers with a long ray
3749 Stems decumbent, Sheaths loose, Seeds smooth

and Miscellaneous Particulars.

like a bug Gmelin informs us, that the inhabitants of Kamtchatka, about the beginning of July, collect the footstalks of the radical leaves, and after peeling off the rind, which is very acrid, dry them separately in the sun, and then tying them in bundles, lay them up carefully in the shade in bags, in this state they are covered with a yellow saccharine efflorescence, tasting like liquorice, this being shaken off, is eaten as a great delicacy From the stalks thus prepared and fermented with bilberries the Russians distil an ardent spirit, which, Gmelin says, is more agreeable to the taste than spirits made from corn. A kind of ale is brewed from the leaves and seeds in Poland and Lithuania, and attempts have been made to extract sugar from this plant, but forty pounds of the dried stalks only yielded a quarter of a pound of powdery sugar. The young shoots may be eaten as asparagus Rabbits and swine are fond of the leaves, but not horses. H sibiricum is used in the same manner in the north of Siberia and Kamtchatka.

673 *Tordylium.* Bodæus à Stapel thinks that the derivation of the name is to be found in τορνος, a lathe, and ιλλω, to turn, because the seeds seem as if turned in a lathe But this seems to be a commentator's guess only

674 *Astrantia* From αστηρ, a star, and αντι, similar, so called with reference to the beautiful starlike dispositon of the involucrum of all the species, and of A. minor in particular

675 *Zosima* Named by Hoffmann, in honor of the three famous brothers Zosimades, the celebrated patrons of so many fine editions of the Greek classics. A remarkable plant, formerly referred to Heracleum, native of most of the eastern parts of the world

676 *Rumia.* Named by Hoffman after Rumia or Rumina, the goddess who presided over suckling, on

History, Use, Propagation, Culture,

which account all vascular substances, with firm outside but very cellular structure inside, were said to be Ruminosa The seeds of this genus are of that nature There was also a Dr Rumy, professor of agriculture in some Polish university

677 *Cachrys* One of the names given by the Romans to the Rosemary. According to Morison, the name was derived from *καιω*, to grow hot, on account of the carminative qualities of the plant The Cossacks of the Jaik chew the seeds of C odontalgica for pain in the teeth, and obtain relief by the copious salivation which follows their use This genus is well known by its corky large smooth seeds

678 *Hippomarathrum* From *ἱππος μαραθρον*, horse-fennel, on account of its size compared with that of common fennel.

679 *Viburnum* This name is derived, according to the account of Sebastian Vaillant, from the Latin word *viere*, to tie, on account of the pliability of the branches of some species. V tinus (*τινος*, small, dwarf, tiny) is one of the most ornamental of evergreen shrubs, with shining leaves and shewy white flowers, which appear during the winter months V. lucidum and strictum are taller and more tender than the common species, of which they are by many considered as only varieties

V. lantana (from *lento*, to tie) grows chiefly on calcareous soils it has pliant mealy twigs, and the bark affords a bird lime.

V. opulus, (alteration of *populus*) var roseum, is a most ornamental shrub, producing large white bunches of

3750 Leaves bipinnate, Pinnæ opposite linear rather pungent, Seeds furrowed smooth
3751 Leaves supra-decompound setaceous many-cut, Seeds even smooth
3752 Leaves pinnate and ternate, Leaflets oblong crenate

3753 Leaves bipinnate, Leaflets linear, Stem furrowed

TRIGYNIA.

3754 Leaves ovate oblong entire, Divisions of the veins and the young branches glandular hairy
α Leaves oval oblong beneath and at edge hairy
β Leaves lanceolate oblong at the edge and veins beneath hairy
γ Leaves ovate hairy on both sides stiff
3755 Leaves coriaceous ovate lanceolate shining entire
3756 Leaves broad ovate rugose hairy beneath, Common involucre 7-leaved
3757 Leaves obovate roundish and oval smooth finely serrated with edged stalks
3758 Evergreen smooth, Leaves coriaceous elliptical oblong distantly toothed
3759 Leaves oblong obtusely serrated, Stalks and peduncles with scaly pubescence
3760 Smooth, Leaves ovate nearly acute subserrate, Leaf-stalks smooth, Fruit ovate oblong, Cymes stalked
3761 Leaves broad ovate acuminate finely serrated, Stalks edged crisp
3762 Leaves obl narr at base rather blunt entire revolute at edge smooth above shining with netted veins
3763 Leaves ovate serrate dotted with hairs, Cymes dichotomous few-flowered
3764 Smooth, Leaves obovate crenate toothed or entire obtuse, Umbels sessile, Fruit roundish ovate

3765 Smooth, Leaves ovate lanceolate acute at each end crenate revolute at edge, Stalks keeled glandular
3766 Leaves obl lanc unequally and finely serrated at base wedge-shaped and entire, Branches compr square
3767 Leaves linear lanceolate shining above obsoletely serrated or entire, Branches square
3768 Leaves ovate tooth-serrated plaited
3769 Leaves oval acuminate tooth-serrated plaited pubescent
3770 Somewhat decumbent, Lvs rounded cord abruptly acumin toothed with the stalks and nerves powdery
3771 Leaves ovate oblong cordate serrate beneath rugose with veins downy
3772 Leaves roundish cord furrowed with plaits beneath downy with a very soft pubescence, Cymes radiant
3773 Leaves cord ovate generally 3-lobed loosely serrat stalks without glands at base with stipules and downy
3774 Leaves 3-lobed acuminate toothed, Stalks glandular smooth

3775 Leaves 3-lobed acute behind 3-nerved divaricating rarely toothed, Stalks glandular, Cymes radiant
3776 Leaves 3-lobed behind obtuse 3-nerved, Lobes very short tooth-serrated, Serrat acumin Cymes radiant

3777 Cymes 3-parted, Stipules leafy, Stem herbaceous, Leaves pubescent beneath
3778 Cymes with many abortive fleshy flowers, Stem herbaceous warted, Leaves quite smooth
3779 Cymes 5-parted, Stem arborescent

3780 Flowers umbelled, Leaves pinnatifid, Stem shrubby
3781 Cymes 5-parted, Leaves about twice pinnated, Stem shrubby
3782 Panicle ovate, Leaflets lanceolate acuminate unequal at base, Leaf-stalk hairy, Stem shrubby
3783 Panicle ovate, Leaflets oblong acuminate nearly equal at base, Stalks smooth, Stem arborescent

3784 Leaflets ovate oblong obtuse mucronate scabr above villous beneath, The last joints of stalk membranous
3785 Leaflets lanceolate acuminate finely serrated hairy beneath

and Miscellaneous Particulars

white flowers, resembling those of Hydrangea, and like them abortive With lilac, laburnum, and scarlet thorn it forms an elegant group

680 *Sambucus* A musical instrument called by the Latins *sambuca*, is supposed to have been made of the wood of this tree, on account of its hardness The tree was always famous for this quality, so that Pliny says it consists of nothing but skin and bones (*b* xvi c 30) S ebulus is supposed to prevent diseases in swine if used as litter. the root is violently cathartic, the leaves drive away mice, and the berries dye blue.

S nigra with its varieties, and S racemosa, are very shewy trees in shrubberies when in flower and fruit. S nigra is narcotic, purgative, and acrid, the flowers in decoction are diaphoretic and expectorant, used to flavor vinegar, and deleterious to turkeys The French put layers of them in heaps or casks of apples, to which they communicate a most agreeable odor The berries are poisonous to poultry, but make a powerful wine much in esteem among country people As the common elder will grow either exposed to the sea breeze or on high mountains, it is recommended as a nurse-plant in forming plantations To thrive and be productive as a fruit tree however, it requires a deep, rather moist, and rich soil

681 *Rhus.* Derived from the same root as Rosa, *rhudd*, in Celtic, signifying red, on account of the color of the fruit. *Pus*, in Greek Sumach, its English name, is an alteration of *summâq*, its name in Arabic (*Forsk*) In some of the species of this genus the flowers are hermaphrodite, in others, as R. elegans, pentaphyllum, and Toxicodendron, the male and female are on separate plants In R. toxicodendron, they

History, Use, Propagation, Culture,

are polygamous males, being mixed with the hermaphrodites The species from the Cape of Good Hope rarely flower in this country, and are chiefly cultivated for the sake of their foliage, which is neat and not susceptible of injury from bad management

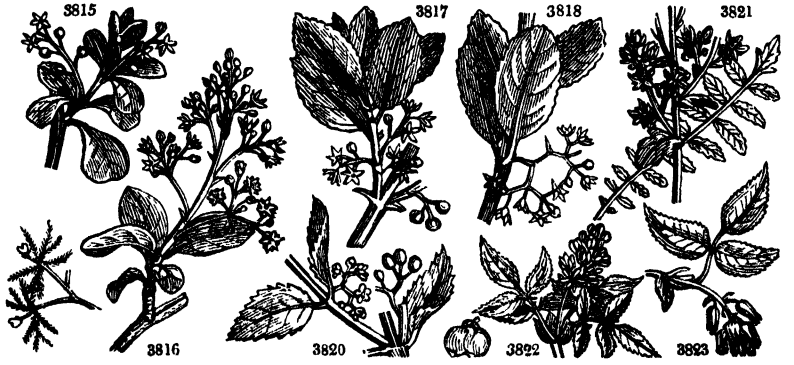
R. Coriaria is used instead of oak bark for tanning leather, and it is said that that of Turkey is chiefly tanned with this plant The seeds are in common use at Aleppo at meals to provoke an appetite. Both leaves and seeds are used in medicine as astringent and styptic

R. javanica in China affords an oil by bruising the berries and boiling them in water · they use it as a varnish, but it does not keep its polish so well as the oil of R vernix.

R. glabra has berries which dye red, and the branches boiled with the berries afford a black ink-like tincture. This plant is like a weed in some parts of North America, where it overruns land left for a few years in pasture.

R vernix affords the true Japan varnish, which oozes out of the tree on its being wounded, and grows thick and black when exposed to the air It is so transparent, that when laid pure and unmixed upon boxes or furniture, every vein of the wood may be clearly seen With it the Japanese varnish over the posts of their doors and windows, their drawers, chests, boxes, scymitars, fans, tea-cups, soup-dishes, and most articles of household furniture made of wood. The milky juice of the plant stains linen a dark brown. The whole shrub is in a high degree poisonous; and the poison is communicated by touching or smelling any part of it In forty-eight hours inflammation appears on the skin, in large blotches, principally on the extremities, and on the glandular parts of the body · soon after small pustules rise in the inflamed parts, and fill with watery matter, attended with burning and itching In two or three days the eruptions suppurate; after which the inflammation subsides, and the ulcers heal in a short time. It operates, however, somewhat differently upon

3786 Leaflets ovate acuminate serrate beneath downy
3787 Leaflets lanceolate acuminate with close serratures smooth on both sides whitish beneath
3788 Leaflets lanceolate acuminate in the middle distantly serrated smooth on both sides, Flowers dioecious
3789 Smoothish, Leaflets lanceolate oblong serrated downy beneath, Racemes erect green
3790 Dwarf, Branches and leaf-stalks pubescent, Leaflets oval, Fruit very downy
3791 Leaflets entire annual opaque, Leaf-stalk entire equal
3792 Leaflets entire perennial shining, Leaf-stalk entire equal
3793 Leaves very large coarse rugose and downy
3794 Leaves pinnated in 9 pair rugose smooth above
3795 Leaflets obcordate, some of them very glaucous
3796 Stem shrubby unarmed, Leaves ternate hoary cuneate ovate, the middle one longest
3797 Prickly, Leaves ternate smooth, Leaflets narrow wedge-shaped at the end 3-lobed and entire
3798 Spiny, Leaflets wedge-shaped toothed beyond the middle, above shining with prominent nerves
3799 Leaflets unequally serrated, Outer petioles with membranous joints
3800 Leaflets entire, Leaf-stalk membranous jointed
3801 Stem rooting
α Leaves large entire or rarely toothed, Creeping
β Dwarf, Leaves variously sinuated downy about flowering time, Erect
γ Leaflets oblong oval with a long point, Fruit very small
3802 Leaflets sessile ovate rhomb-shaped cut serrate hairy



3803 Leaflets lanceolate entire sessile smooth on each side ciliated, Common stalk pubescent, Branches pend.
3804 Leaflets obovate mucronate toothed smooth, Stem scabrous
3805 Leaflets sessile wedge-shaped very smooth 7-toothed, Teeth mucronate
3806 Leaflets sessile wedge-shaped cut pinnatifid beneath downy and veiny
3807 Leaflets stalked rhomb-shaped angular downy beneath
3808 Leaflets obovate entire sessile hairy on both sides
3809 Leaflets obovate mucronate smooth, Branches villous
3810 Leaflets linear lanceolate entire smooth narrowed at base the intermediate one stalked
3811 Leaflets stalked linear lanceolate entire downy beneath
3812 Leaflets sessile linear revolute rusty beneath
3813 Prickly, Leaves fingered, Leaflets linear lanceolate at the end toothed or entire
3814 Leaflets oblong entire sessile acute on each side smooth, Panicle terminal long
3815 Leaflets obovate sessile very narrow at the base smooth on both sides, Corymbs axillary

3816 Leaves obovate

3817 Leaves stalked ovate retuse crenated, Panicle twice as short as leaf
3818 Leaves stalked ovate subserrate entire at base
3819 Leaves sessile entire obovate coriaceous
3820 Leaves stalked ovate subserrate, Peduncles dichotomous shorter than the leaves, Fruit ovate

3821 Leaves like the mountain ash, Flowers in long erect panicles from among the leaves

3822 Leaves pinnate
3823 Leaves ternate

and Miscellaneous Particulars

different constitutions, and some are incapable of being poisoned with it at all Persons of irritable habits are most liable to receive it.

Rhus aromatica and suaveolens, the male and female of one species, have been made into a distinct genus called *Schmaltzia*, by Desvaux and Turpinia, and afterwards *Lobadium*, by the ingenious M Rafinesque Schmaltz The expressed oil of the seed of this species, and also of R. succedanea, acquires the consistence of suet and serves for making candles.

R Toxicodendron is poisonous to some persons, like R. vernix, but in a less degree. Kalm relates, that of two sisters, one could manage the tree without being affected by its venom, whilst the other felt its exhalations as soon as she came within a yard of it, or even, when she stood to windward of it, at a greater distance; that it had not the least effect upon him, though he had made many experiments upon himself, and once the juice squirted into his eye, but that on another person's hand, which he had covered very thick with it, the skin, a few hours after, became as a piece of tanned leather, and peeled off afterwards in scales.

R. pumila is another dangerous species Lyons, the collector, suffered severely for several weeks, after only collecting the seeds

R cotinus is cultivated for tanning leather near Valcimara in the Apennines, where it is called Scotino.

682. *Cassine* An American name These are shrubs with handsome foliage, but generally inconspicuous white or green flowers. C Maurocenia has its specific name in honor of the Venetian senator F Mauroceni, who had a fine garden at Padua.

683 *Spatheia*. The upright habit and want of branches make this tree resemble a palm-tree, anciently called Ζραθη. A very handsome stove shrub, rarely flowering.

684. *Staphylea*. From σταφυλη, a bunch, in which form its fructification is disposed Handsome hardy

History, Use, Propagation, Culture,

shrubs. S. pinnata has hard smooth nuts, which are strung for beads by the Catholics in some countries, while in others the kernels, though bitter, are eaten by the inhabitants.

685. *Tamarix* Tamarisci were people who inhabited the Spanish side of the Pyrenees, where one species grows abundantly on the banks of the Tanaris, now called the Tambra T. gallica, as it stands the sea breeze, is sometimes used as a hedge plant in such situations.

686. *Turnera.* So named by Plumier, in memory of William Turner, M D. Prebendary of York, &c. author of " A new Herball," London, 1551 died in 1568 All the species are of the easiest culture, but few of them of any beauty. They are chiefly weeds with yellow Cistus-like flowers.

687. *Drypis.* From δρυπτω, to tear. Its leaves are armed with stiff spines

688. *Alsine.* From αλσος, shady place, where alsine loves to grow. Little weeds of no beauty. *Morgeline,* Fr.

689. *Telephium.* Pliny says, Telephus was a king of Mysia, and had his wounds cured by Achilles with this plant. A little inconspicuous weed, with the appearance of a minute Euphorbia.

690. *Corrigiola.* A diminutive of *corrigia,* a thong, and applied to the plant we call Polygonum aviculare,

3824 Bractes shorter than flower-stalks, Spikes lateral panicled, Leaves lanceolate subulate stem-clasping
3825 Flowers sessile, Spikes lateral, Leaves very short sheathing, Branches with turbinate mucronate joints
3826 Spikes terminal solitary, Bractes longer than flower-stalks, Leaves linear lanceolate sessile

3827 Flowers sessile, Leaves oblong acute serrate pubescent with two glands at base

3828 Flowers sessile, Leaves ellipt cuneate obtusely serrated scabrous with two glands at base
3829 Bractes subulate, Leaves ovate acute at each end with two glands at the base
3830 Flowers sessile, Leaves without glands
3831 Peduncles axillary leafless, Leaves serrated at end
3832 Raceme terminal long, Leaves ovate unequally obtusely serrated

3833 A small glaucous plant with rigid prickly leaves

3834 Petals bipartible, Leaves ovate cordate
3835 Petals entire, Leaves subulate
3836 Petals entire short, Leaves bristly, Calyxes awned

3837 Leaves alternate

3838 Flowers stalked, Calyxes membranous at edge
3839 Stem diffuse procumbent, Leaves oblong ovate, Branches leafless

3840 Peduncles umbelled lateral as long as linear leaves
3841 Umbels unequal, Leaves linear distant
3842 Peduncles 1-flowered lateral, Flowers as long as leaves, Stem depressed
3843 Common peduncles very long, Leaves linear, Stipules hairy
3844 Peduncles axillary elongate dichotomous, Leaves whorled linear

3845 A fleshy shrub with many small opposite fleshy roundish leaves

3846 Leaves flat, Peduncles simple
3847 Leaves round ovate, Spikes lateral
3848 Leaves ovate wavy, Peduncles simple longer than the leaf
3849 Leaves cordate, Peduncles clustered branched
3850 Leaves cordate roundish, Peduncles simple shorter than the leaf

TETRAGYNIA.

3851 Radical leaves cordate acuminate, Nectaries many-parted
3852 Radical leaves nearly orbicular, Nectaries with 3 bristles
3853 Radical leaves reniform, Petals unguiculated, Nectaries 3-parted

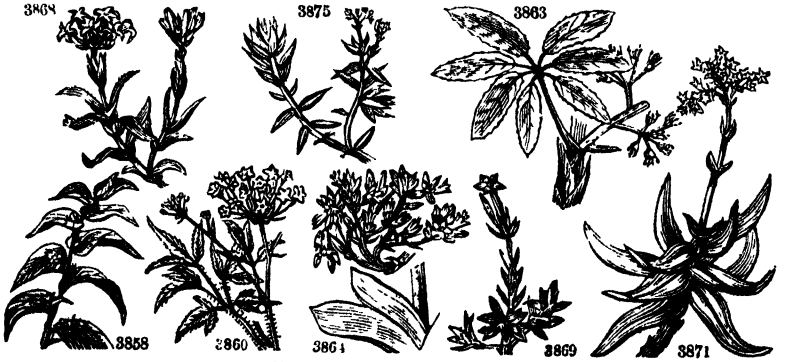
PENTAGYNIA.

3854 Leaves linear lanceolate sessile, Peduncles 1-3-fl a little longer than the leaves
3855 Leaves reniform repand
3856 Leaves roundish, Stem creeping, Flowers nearly sessile

and Miscellaneous Particulars

in allusion to the long and slender shoots of that plant. The Corrigiola of modern times is related to the Polygonum.

691 *Pharnaceum* Named after Pharnaces, king of Pontus, who is said by Pliny to have been the first to use the plant. Pretty little herbaceous plants, with fine leaves, and elegant umbels of usually white flowers.



692. *Portulacaria*, that is to say, a Portulaca-like plant. The leaves of this plant resemble purslane, whence also the English name, as well as the Latin name.

693 *Basella.* A Malabar name. The species of this genus are used in China as spinage plants · they are also raised on a hotbed at Paris in spring, and transplanted into a warm border for the same purpose, and are said to furnish a summer spinage equal to that of the orache.

694 *Parnassia.* From Mount Parnassus, the abode of grace and beauty, where, on account of the elegance of its form, this plant is feigned to have first sprang up. P. palustris is one of the most elegant of marsh plants, well deserving a place in aquatic collections.

695 *Evolvulus.* Derived from *evolvo*, to turn, in the same sense as Convolvulus, which this genus entirely resembles in habit.

History, Use, Propagation, Culture.

696. *Aralia.* A name of unknown meaning, under which one species was sent to Fagon from Quebec, in 1764, by one Sarrazin, a French physician. *A. spinosa* is an ornamental low tree for lawns, on account of its Angelica-like leaves.

697. *Actinophyllum.* From *ακτιν*, a ray, and *φυλλον*, a leaf, because the leaflets are disposed as it were in rays round a centre. Fine Aralia-like plants, with beautiful foliage, but not with any attraction in the appearance of the flowers.

3857 Procumbent villous, Leaves oval subsessile, Capsules deflexed
3858 Very hairy, Leaves subsessile oblong cordate acuminate, Flowers sessile 3 together

3859 Arborescent, Stem and leaves prickly
3860 Stem suffruticose and leaf-stalks hispid, Leaves decompound
3861 Stem herbaceous smooth, Leaves decompound, Peduncles axillary branched umbelled
3862 Stemless, Leaves decompound, Scapes leafless

3863 Leaflets 5 very smooth shining elliptical entire

3864 Leaves opposite nearly connate oblong with an auricle on one side, falcate
3865 Leaves ovate oblong flat, edge with a cartilagin fringe, at the base connate sheathing, Flowers term. sessile
3866 Leaves linear with a cartilaginous fringed edge, Stem shrubby, Cyme terminal
3867 Leaves flat connate perfoliate smooth, Flowers in corymbose panicles
3868 Leaves linear flat fringed with cartilage connate sheathing at base, Flowers terminal sessile
3869 Stem decumbent, Leaves ovate cruciate, Head 2-flowered, Petals connate
3870 Erect, Leaves oblong lanceolate with cartilaginous teeth at base sheathing, Umbels double many-flow

§ 1 *Shrubby, Leaves subulate*

3871 Leaves lanceolate subulate sessile connate channelled convex beneath
3872 Leaves subulate above flat connate perfoliate smooth much spreading, Peduncle long, Flowers cymose
3873 Leaves subulate incurved obscurely 4-cornered spreading, Stem erect shrubby rooting
3874 Leaves ½ cylindrical acute gibbous beneath smooth nearly erect, Cymes terminal compound
3875 Leaves connate rounded subulate spreading, Cymes few-flowered on long stalks, Stem shrubby decumbent
3876 Leaves subulate radical, Stem naked

§ 2 *Shrubby, Leaves broad, smooth*

3877 Leaves roundish acute glaucous fleshy dotted, Cyme trichotomous
3878 Leaves opposite ovate oblique entire acute distinct somewhat cartilaginous at edge
3879 Leaves ovate attenuate at base connate entire dotted inside the edge, Cymes panicle-shaped
3880 Leaves opposite obovate cultrate oblique connate entire

§ 3 *Shrubby, Leaves broad, distant, ciliated.*

3881 Leaves opposite oval flattish distinct fringed, Corymbs terminal
3882 Leaves connate ovate expanded cartilaginous crenated, upper ovate elliptical wavy, Stem dichotomous
3883 Leaves opposite spreading connate rough fringed, Stem rough backwards
3884 Leaves linear obtuse sheathing convex on both sides, Flowers cymose, Stem decumbent
3885 Leaves obl con obtuse falcate with a cartilaginous fringed edge, Pan long, Peduncle opposite clustered
3886 Leaves obovate subconnate, Branches axillary few-flowered, Petals lanceolate reflexed
3887 Leaves lanceolate convex beneath, Corymbs small axillary, Petals lanceolate

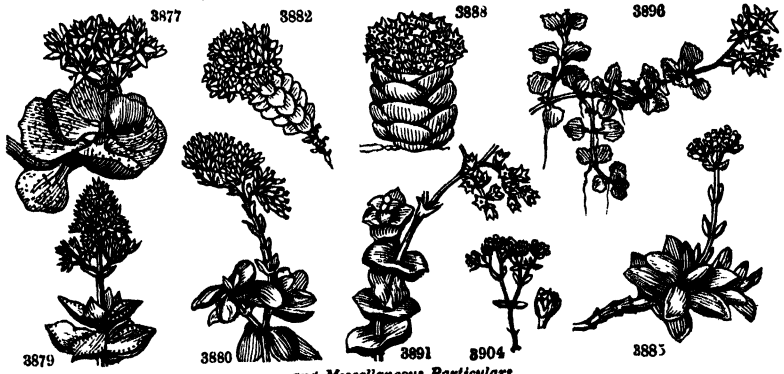
§ 4 *Shrubby, Leaves broad, very closely imbricated*

3888 Leaves round imbricated, Fascicle round terminal
3889 Leaves ovate acute smooth imbricated in rows, Flowers axillary sessile
3890 Leaves radical decussately imbricated fringed lanceolate cultrate hoary

§ 5 *Shrubby, Leaves broad, very much perfoliate*

3891 Leaves connate perfoliate cordate dotted
3892 Leaves opposite ovate dotted fringed, Lower oblong
3893 Leaves cordate perfoliate acuminate flat spreading dotted within the edge
3894 Stem flaccid creeping, Leaves opposite

§ 6 *Shrubby, Leaves stalked*



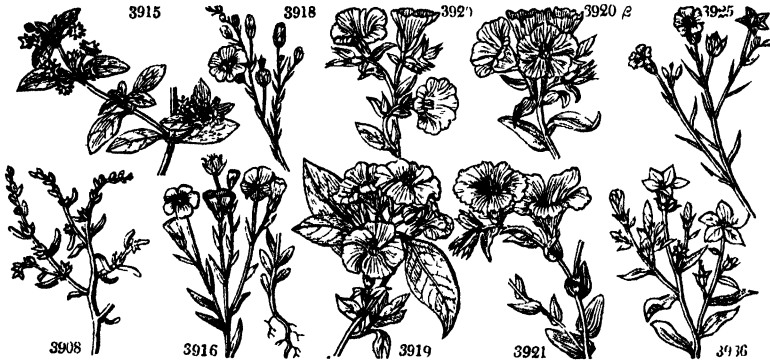
3895 Leaves stalked cordate roundish acute crenate, Corymbs panicle-shaped
3896 Leaves stalked cordate obtuse entire, Cymes panicle-shaped

§ 7 *Herbaceous*

3897 Villous, Leaves connate lanceolate fringed, Stem nearly naked terminal, Spike whorled
3898 Lower leaves distinct opposite tongue-shaped ciliated pubescent, Flowers whorled sessile close, Stem leafy
3899 Leaves connate oblong downy fringed, Stem rather naked, Flowers corymbose close
3900 Leaves oblong obtuse cartilaginous-fringed tufted, Scape panicled, Branches opposite cymose

§ 8 *Annual or biennial*

3901 Leaves connate oblong remote flat, Stem simple, Cyme compound, Flower stalks bent backwards
3902 Leaves cordate sessile, Peduncles terminal axillary approximate umbellate
3903 Stem dichotomous, Leaves sessile oblong ovate cordate flat, Peduncles axillary 1-flowered
3904 Stem dichotomous, Leaves sessile ovate oblong channelled recurved, Peduncles axillary 1-flowered
3905 Stem dichotomous rough, Leaves lanceolate, End flowers in bundles



and Miscellaneous Particulars.

698. *Rochea.* Named after M. de la Roche, author of "Historia Eryngiorum," a work of reputation. This succulent genus thrives well in sandy loam, and requires but little water. "Young cuttings taken off and laid to dry a few days, and then potted, or stuck in the tan, will root directly." (*Sweet*)

699. *Crassula.* From *crassus*, thick, in allusion to the fleshy nature of the leaves and stems of all the species. These plants grow best in sandy loam and brick rubbish, with the pots well drained. "Cuttings root

History, Use, Propagation, Culture,

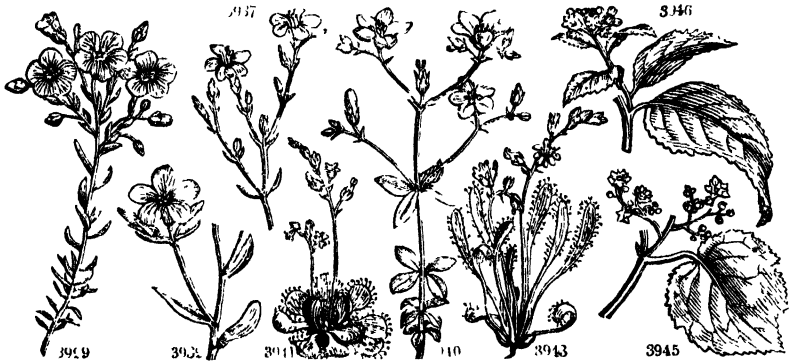
easily if laid to dry a few days after cutting off; before they are planted, to dry up the wound, that they may not rot. They require no covering, but may be placed in any convenient situation" (*Sweet*)

700 *Gisekia* In honor of P D Giseke, a Danish botanist, who lived about the end of the last century A small weed-like plant, with the habit of Chenopodium

701 *Linum Lin*, in Celtic, signifies thread, whence λινον, in Greek, and *linum*, and its derivations, in Latin L usitatissimum, is a well known thread or clothing plant, which has been cultivated from the remotest antiquity for its cortical fibres, or boon, which, when separated from the woody matter or harl, as it is technically called by the growers, forms the lint and tow which is spun into yarn, and wove into linen cloth The seeds are sown on well comminuted loamy soil, which is in good heart, in April, broadcast during summer weeds are carefully removed, and when the plant is in full flower, or (if seed is desired) when the seed capsules are ripe, it is pulled up by the roots, the capsules torn off by a comb, and the stalks tied in bundles and carried to a pond or pool of stagnated water Into this water the bundles are thrown, and kept under the surface by being loaded with planks, stones, &c for ten days or a fortnight, till an appearance of decay or softness is indicated by the bark, they are then taken out and spread on the grass, or on the gravelly banks of a river for a fortnight, where the alternate dews and heats accelerate the progress of decay It is next taken up, and when quite dry tied into bundles and stacked till wanted by the flax-cleaner Some cultivators do not steep the flax in water, but only spread it on the surface of grass ground, which is called dew-retting, and has nearly the same effect as the other, but the more recent practice, not yet however very general, is neither to steep or dew-rot, but to dry, bind, and stack as in saving a crop of corn, and afterwards to separate the capsules and the fibre by machinery By this process the fibre is obtained of much greater

3906 Stem dichotomous pubescent, Leaves linear-lanceolate, End flowers in bundles
3907 Leaves ovate acute distinct ciliated, Stem simple downy, Raceme compound, Branches panicled
3908 Leaves oblong lanceolate acute connate ciliated, Stem smooth, Raceme elongated, Fl in bundles sessile
3909 Leaves fusiform depressed, Cyme 4-fid leafy, Flowers sessile, Stamens reflexed
3910 Leaves spreading, Flowers whorled awned
3911 Leaves half cylindrical subulate channelled above spreading, Peduncles axillary solitary 1-flowered
3912 Leaves alternate somewhat spatulate acute entire, Raceme compound
3913 Leaves oblong narrowed at base remotely crenate, Peduncles opposite the leaves and axillary solitary
3914 Stem procumbent, Leaves connate oblong acute, Peduncles axillary 1-flowered, Flowers tetrandrous

3915 Leaves elliptical lanceolate



3916 Sepals ovate acute 3-nerved, Petals crenate, Leaves lanceolate, Stem nearly solitary
3917 Sepals and leaves lanceolate subulate 3-5 nerved smooth, Stems branched at end
3918 Sepals obovate obtuse about 5-nerved smooth, Stems numerous ascending
3919 Leaves elliptical acute nearly entire, Styles 3, Capsules 6-celled
3920 Sepals hairy acuminate sessile alternate, Leaves alternate, of the branches opposite

3921 Sepals hairy acuminate, Flowers spiked, Spikes revolute, Leaves cordate-ovate pubescent
3922 Sepals acuminate, Leaves lanceolate scattered upright rough acuminate, Stem rounded branched at base
3923 Sepals acuminate, Leaves ovate lanceolate acuminate reflexed smooth, Filaments connate
3924 Sepals acuminate, Leaves scattered setaceous rough backwards
3925 Sepals elliptical 3-nerved and capsules acuminate, Leaves linear lanceolate 3-nerved, Stems numerous
3926 Sepals subulate acute, Leaves linear lanceolate, Peduncles of panicle about 2-flowered, Flowers sessile
3927 Sepals ovate acute blunt, Leaves lanceolate lower opposite
3928 Sepals rounded obtuse, Leaves linear acutish, Stems declinate
3929 Sepals rounded obtuse, Leaves linear straight acute
3930 Sepals acute alternate, Capsules pointless, Stem panicled, Leaves lanceolate radical ovate
3931 Sepals ovate acuminate 3-nerved fringed, Leaves very stiff short, Petals oblong very narrow
3932 Sepals acuminate scabrous, Leaves with two glands at base, smooth at edge, Cor monopetalous
3933 Base of the leaves dotted with glands on both sides

3934 Sepals subulate, Leaves lanceolate upright mucronate rough at edge
3935 Leaves linear acute rough, Stems half shrubby
3936 Leaves wedge-shaped, Stems arborescent
3937 Leaves linear lanceolate, Flowers terminal stalked
3938 Flower leaves lanceolate, Flowers alternate sessile, Cal as long as leaves
3939 Leaves obovate lanceolate entire, Stem dichotomous upwards, Petals acute
3940 Leaves 4-together

3941 Leaves orbicular radical, Scape racemose erect
3942 Scapes radical ascending, Leaves oval, Stigmas emarginate
3943 Scapes radical erect, Leaves oblong lanceolate, Stigmas clavate
3944 Scapes radical branched, Leaves filiform very long

3945 Leaves cordate ovate acuminate unequally tooth-serrated, rough above downy beneath
3946 Leaves long cordate unequally serrate hairy on both sides

and Miscellaneous Particulars

strength; there is less loss of seed, less demand for labor at a busy season, and the refuse of the operation forms an excellent food for horses or cattle The machines for breaking and cleaning flax are worked by hand, and the best at present is considered that of Bundy The process of steeping and spreading flax has the further effect on the fibre of bleaching it when the machine is used, the bleaching progress is effected by steeping in soft soap Flax seed yields by expression a valuable oil, in powder it is much used in poultices, and the refuse, after pressing for oil, forms a cake fit to feed broken-winded horses, to fatten cattle, and for manure

L. perenne may be used for the same purpose as the other both species have been proposed by some gardeners to be adopted as border-flowers

702 *Drosera* From δεερος, dew, on account of the pellucid dew-like glands on the surface of the leaves, whence also our English name *sun-dew* The famous Italian liqueur is called *Rossoli*, on account of the usage of this plant in its composition D rotundifolia is an acrid caustic plant, by some supposed to occasion the rot in sheep. it curdles milk, removes warts and corns, and takes away freckles and sunburn distilled with wine it produces a very stimulating spirit, and it was formerly much used as a tincture spiced and sweetened The leaf hairs support globules of clear liquor even in the hottest weather, are very irritable, and close upon small insects that touch them, after which the leaf itself bends and holds the dead insect imprisoned.

703 *Commersonia* Named by Forster in memory of M Commerson, the French traveller and botanist, who accompanied Bougainville in his voyage round the world He stopped at the Isle of France, where he died in 1774, after having discovered an immense quantity of new plants C dasyphylla is a pretty flowering shrub, both species grow freely from cuttings in sand under a hand-glass.

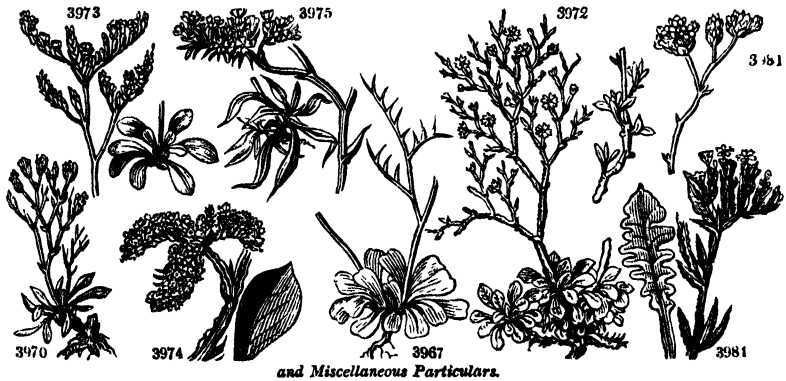
History, Use, Propagation, Culture,

704. *Rulingia* Named in honor of J P Ruling, author of an Essay on the Natural Orders A plant related to Commersonia

705. *Armeria* Derivation unexplained. This is a genus of handsome plants, for the most part well suited for rock-work, or growing in pots. A vulgaris is considered the most valuable edging plant next to the box

706. *Statice* From στατίζω, to stop This plant, says Pliny, stops diarrhœa This is a very ornamental

3947 The only species



3948 Scape rounded smooth, Outer leaves of involucrum acute, Leaves linear flat obtuse
3949 Scape rounded pubescent, Leaves of involucr obtuse, Leaves linear flat obtuse ciliated at base
3950 Scape compressed smooth, Leaves of involucr. ellipt. rounded, Leaves lin. flat acute membr. at edge
3951 Scape long, Bractes 2 or 3 longer than head, Leaves linear stiff smooth
3952 Scape rounded smooth, Outer leaves of involucr lanceol. acute as long as head, Leaves lin. flat fringed
3953 Scape rushy, Leaves linear lanceolate acute flat narrowed downwards
3954 Quite smooth, Scape simple, Leaves linear flat, the first toothletted, Leaves of involucr ovate lanc acum
3955 Scape rounded roughish, Outer leaves of involucr obl ov acute inner obl. obtuse, Leaves lanc. flat 3-nerved
3956 Scape rounded smooth, Outer leaves of involucr elliptical mucronate, Leaves lanc flat acute 3-nerved
3957 Leaves long lanceolate entire smooth 3-nerved acute soft, Leaves of involucr acute edged
3958 Scape rounded smooth, Leaves of involucr elliptical obtuse, Leaves linear acute channelled

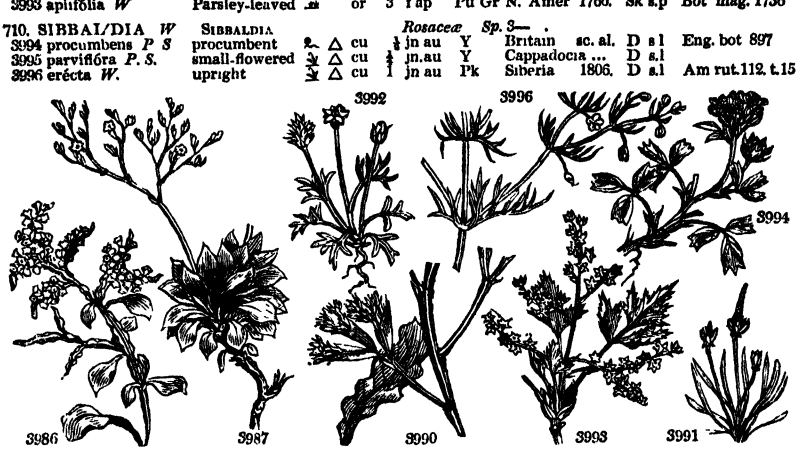
3959 Branches 3-cornered, Leaves linear channelled
3960 Scape panicled rounded, Leaves wavy at edge oblong smooth obtuse mucronate beneath
3961 Scape panicled pubescent, Leaves elliptical mucronate beneath and nearly smooth
3962 Scape panicled much branched and lvs ovate oblong obtuse somewhat wavy, beneath mucronate smooth
3963 Scape panicled much branched rough, Leaves pubescent, Hairs in starry bundles
3964 Scape panicled rounded, Lower branches sterile, Leaves oblong spatulate obtuse smooth nearly blunt
3965 Scape simple rounded, Spikes lateral and terminal 1-sided, Leaves spatulate acute
3966 Leaves spatulate emarginate, Scape erect panicled, Upper branches simple, Lower bifid, Flow 1-sided
3967 Scape panicled, Leaves spatulate retuse
3968 Leaves somewhat radical obovate-oblong obtuse, Branches rough
3969 Lvs lanc. wedge-shaped acute, Scape erect roughish branched panicled, Fl. 1-sided, Cal at edge membr
3970 Lvs. lanc cuneate obtuse, Scape decumbent branched panicled, Fl branches long, Bractes mem at edge
3971 Lvs spatul. ret Scape erect branched rough, Sterile branches pectinate, Fl very close, Brac transparent
3972 Rough with hoary dots, Scape panicled rounded jointed much branched divaricating, Leaves spatulate
3973 Radical leaves spatulate obtuse glaucous entire on long stalks, Scape rounded, Flowers racemose 1-sided
3974 Scape branched nearly round, Branches 2-edged winged, Fl imbricated, Lvs obov cuspidate mucronate
3975 Scape leafy, Branches 3-cor winged, Fl aggregate in interrupted spikes, Bractes acum longer than cal.
3976 Scape dichotomous, Leaves lanceolate mucronate, Flowers alternate distant
3977 Scape dichotomous corymbose, Spike-headed, Fl imbricated, Lvs lanc wedge-shaped mucronate 3-nerved
3978 Stem leafy, Leaves obovate wedge-shaped 3-nerved mucronate
3979 Stem shrubby leafy, Leaves clustered wedge-shaped smooth pointless, Scape few-flowered
3980 Stem and branches panicled 3-cornered, Leaves obovate stalked, Spikes 1-sided
3981 Stem shrubby naked above and branched, Heads sessile, Leaves lanceolate sheathing
3982 Stem shrubby leafy, Flowers solitary, Leaves lanceolate sheathing
3983 Stem shrubby branched, Branches imbricated, Paleæ with a bristle at end
3984 Stem herbaceous two-edged, Radical leaves lyrate, cauline linear
3985 Stem winged, Radical leaves sinuate, cauline lanceolate, Peduncles cuneate 3-winged
3986 Stem crisp, Leaves elliptical entire, Spikes 1-sided
3987 Scape panicled rounded, Branches clustered, Leaves obovate spatulate mucronate smooth, Cal acute
3988 Scape panicled, Leaves lanceolate 3-nerved wavy mucronate at end, Branches of panicle 3-cornered
3989 Leaves broad lanceolate glaucous mucronate, Scape winged, Flowers close corymbose
3990 Radical leaves alternately pinnatifid sinuated, Intermediate segments of cor linear

POLYGYNIA.

3991 Leaves quite entire

3992 Horns of the pericarp falcate ascending

and Miscellaneous Particulars.



genus, the species are not common, and require a little care in cultivation. Statice speciosa and tatarica, are among the prettiest of hardy border flowers S limonium is an inhabitant of salt marshes in many parts of England, whence its name, from λειμων, a marsh

707. *Myosurus* From μυς μυος, a mouse, and ὐρα, a tail. Its seeds are situated upon a very long slender receptacle, which looks exactly like the tail of a mouse.

708. *Ceratocephalus* From κερας, a horn, and κεφαλη, a head, on account of the horn-like ends of the seeds in the heads of the capsules.

History, Use, Propagation, Culture, and Miscellaneous Particulars

709 *Xanthorhiza* From ξανθος, yellow, and ῥιζα, a root, on account of the deep yellow color of the roots A small shrub, with much cut leaves, and branches of dull purplish brown small flowers

710 *Sibbaldia* So named by Linnæus, in memory of Sir Robert Sibbald, professor of physic at Edinburgh, author of Scotia Illustrata, &c 1684 Small alpine plants, with the aspect of Alchemilla

Class VI. — HEXANDRIA. 6 Stamens.

This class contains the most beautiful of the herbaceous plants of our gardens With a few exceptions, it is to a considerable degree a natural assemblage, comprehending a large proportion of those favorites of gardeners, the orders Amaryllideæ, Asphodeleæ, Bromeliaceæ, Liliaceæ, and Melanthaceæ The class also includes a few grasses and palms, some genera of Berberideæ, all Hypoxideæ, and many Juncеæ

The Amaryllideæ, or lilies of the hot-houses, consist of a number of beautiful species, the generic distribution of which is uncertain, and difficult to determine Much attention has been paid to the subject by Messrs Ker, Herbert, and others, by the former, perhaps, with the most success, a great deal still remains to be done. The limits of the genera are very obscure, and their extreme characters similar Among the Bromeliaceæ are found the delicious pine-apple, and the curious Tillandsias, some of which are called air-plants The asparagus and the officinal squill are included in Asphodeleæ To the same class are related the lily of the valley, the Solomon's seal, and many other curious little plants. The Phormium tenax, which produces the strong flax of New Zealand, the aloes, curious for their fantastic foliage, the fragrant tuberose, the plantains, so valuable as an important article of food in all the tropics, are all contained in this class Hither also, are referred the valuable rice, the curious bamboo, and the rush, some of the species of which are well known for their use in œconomical purposes, others as the most worthless weeds of our heaths

Hexandria Trigynia is chiefly made up of the natural order Melanthaceæ, among which the Colchicum and Trillium are found

Order 1 MONOGYNIA.  6 Stamens 1 Style

1 *Monocotyledons Perianth superior, colored*

A *Perianth with the orifice surmounted by a corona or nectary.*

711 *Narcissus* Sepals 6, equal. Cup funnel-shaped, of a single leaf Stamens inserted within the cup
712 *Pancratium* Flower funnel-shaped, with a long tube Sepals 6 Cup 12-cleft, membranous. Stamens inserted on the edge of the cup
713 *Eucrosia* Flower ringent nodding Crown formed by the dilated bases of the stamens. Stamens declinate, united into a tube, which is split on its upper side
714 *Eurycles* Flower funnel-shaped, regular Crown fleshy, short. Stamens inserted into the edge of the cup
715 *Chlidanthus.* Flower funnel-shaped, irregular Stamens erect, included, united by their dilated bases, the short filaments 2-toothed Anthers innate. Ovary 3-celled, many-seeded. Style filiform Stigma 3-lobed Capsule cartilaginous, 3-valved Seeds membranous
716 *Calostemma.* Flower funnel-shaped, with a 6-parted limb. Crown tubular, with a 12-toothed mouth, the alternate teeth anther-bearing. Ovary 1-celled, 2-3-seeded. Style filiform. Stigma obtuse. Berry 1-2-seeded
717. *Chrysiphiala.* Flower funnel-shaped, with a tube narrowed downwards thickened at the base, with a dilated 6-cleft limb. Crown 6-cleft. Stamens erect, upright. Stigma thickened, obsoletely trifid.

3993 Roots very yellow, Leaves compound

3994 Leaves ternate, Leaflets smooth above hairy beneath, Flowers corymbose, Petals as long as calyx
3995 Procumbent, Leaves ternate, Leaflets 3-toothed on each side rough with hairs, Flowers clustered
3996 Leaflets linear multifid, Plant erect

B *Perianth with the orifice naked.*

* *Stigma undivided*

718 *Lophiola.* Flower woolly, 6-parted, bearded inside Anthers erect. Filaments naked. Ovary nearly superior
719 *Argolasia* Flower woolly, longer than the filaments limb 6-parted, spreading Pericarp 3-celled
720. *Anigozanthus* Flower tubular, incurved. with a 6-parted irregular limb Stamens inserted into the mouth, ascending

* *Stigma 3-lobed* Guzmannia has Perianth inferior

721 *Musa* Spathe superior Cor of 2 petals. one of which is erect and 5-toothed, the other concave and honey-bearing Berry oblong, 3-cornered, many-seeded
722. *Urania* Cal O. Cor 3 petals Nect 2-leaved one of the leaves bifid. Caps 3-celled, many-seeded. Seeds in two rows with an arillus
723 *Bonapartea.* Calyx 2-leaved Petals 3 convolute Stamens inserted in the receptacle Anthers exserted Style 3-cornered Caps 3-celled, 3-valved Seeds numerous, terminated by a bristle
724. *Agave* Flower erect, tubular, or funnel-shaped Filaments longer than flower, erect Capsule triangular, many-seeded
725 *Furcræa* Flower campanulate, 6-parted Stamens inserted in a gland, thickened downwards, compressed, subulate at end Capsule 3-valved, 3-celled, many-seeded
726 *Bromelia* Cal 3-fid. Petals 3 A honey-bearing scale at base of petal Berry 3-celled.
727 *Guzmannia* Cal 3-parted, not superior, with convolute segments Petals 3, rolled together into a tube. Anthers united in a cylinder Caps 3-celled, 3-valved Seeds numerous, oblong, naked
728. *Pitcairnia.* Cal. 3-leaved, half inferior Petals 3 Stigmas 3, twisted together Caps. 3, opening inwards Seeds winged or terminated at each end in a long bristle
729 *Tillandsia* Cal. 3-fid, persistent, convolute Cor 3-fid, campanulate Caps 1-3-celled. Seeds comose
730 *Pontederia* Flower monosepalous, 6-cleft, 2-lipped Stamens inserted into the tube of flower at the top Caps 3-celled
731 *Hæmanthus.* Involucre many-leaved, many-flowered Flower 6-parted Berry 3-celled.
732 *Galanthus* Sepals 3, concave Cup formed of 3 small emarginate sepals Stigma simple
733 *Leucoum* Flower campanulate, 5-parted, with the ends of the sepals thickened. Stigma simple
734 *Strumaria* Sepals 6, spreading Style thickened below the middle, and cohering occasionally with the filaments Stigma trifid Capsule inferior, roundish, 3-celled
735 *Crinum* Flower funnel-form, half six-cleft, with a filiform tube, and a spreading recurved limb Sepals subulate, channelled Seeds fleshy
736 *Cyrtanthus* Flower incurved, tubular, clavate, 6-cleft segments ovate, oblong Filaments inserted into the tube, conniving at end.
737 *Brunsvigia.* Flower 6-parted. Capsule turbinate, 3-winged, nearly transparent, many-seeded
738 *Nerine.* Sepals 6, spreading, wavy Stamens declinate, unequal in direction or proportion Capsule few-seeded Seeds round like peas
739 *Amaryllis* Flower nodding, irregular, funnel-shaped, ringent. Filaments declinate, unequal in proportion or direction. Seeds flat, numerous
740. *Vallota* Flower vertical, regular Stamens regularly spreading Seeds numerous, flat.
741. *Griffinia* Flower 6-parted, ringent. Stamens declinate, with the upper one erect, and away from the rest Seeds few, round, fleshy.
742 *Sternbergia.* Flower vertical, regular, funnel-shaped, with an erect limb Stamens slightly declinate. Anthers versatile Seeds round like peas
743 *Zephyranthes* Flower vertical, nearly regular, funnel-shaped, with an erect limb Stamens nearly regular Anthers versatile. Seeds flat.
744. *Habranthus* Flower campanulate, nodding Stamens declinate, unequal, inserted into a fleshy rim of the base of the tube Stigma 3-lobed
745 *Doryanthes.* Flower 6-parted Filaments shorter than flower Anthers erect.
746. *Gethyllis.* Flower 6-parted, with a filiform very long tube. Spathe obliquely truncated Berry clavate, radical, 1-celled.
747 *Polyanthes.* Flower funnel-shaped, incurved Filaments inserted into the throat. Ovary at the bottom of tube
748 *Alstræmeria.* Sepals 6, campanulate or 2-lipped, the two lower half-tubular at the base Stamens declinate or erect. Stigmas 3, linear Caps roundish-oval, 3-6-angular, 3-valved, or pulpy within, and not opening
749 *Conanthera* Sepals 6, reflexed Anthers united in an acute cone Caps oblong, 3-celled, 3-valved. Seeds few, roundish
750 *Hypoxis* Spathe 2-valved Flower 6-parted, superior Caps long, narrow at the base Seeds roundish, naked.
751. *Curculigo* Sepals 6, flat. Spathe of one valve. Style very short. Stigmas 3, diverging. Caps. 1-celled, 4-seeded, spongy, beaked.

2. *Monocotyledons. Perianth inferior*

A *Perianth glumaceous, irregular.*

752. *Bambusa* Scales 3, covering the 5-flowered spikelets. Glume 2-valved Style bifid Seed 1
753. *Calamus* Sepals 6. Berry dry, 1-seeded, imbricated backwards
754. *Ehrharta.* Glume 2-valved, abbreviated, 1-flowered. Paleæ 4, in pairs, the outer compressed acinaciform, transversely wrinked

B. Perianth not coloured, regular Stems herbaceous. Aroideæ and Junceæ.

755. *Acorus* Spadix cylindrical, covered with florets Sepals 6, naked Style 0. Caps. 3-celled.
756. *Orontium* Spadix cylindrical, covered with florets Sepals 6, naked Style 0. Follicles 1-seeded.
757. *Tupistra.* Cor 1-petalous, 6-fid, nearly equal Anthers sessile in middle of sepals Style 3 cornered, thick Stigma clypeate, 3-lobed
758 *Tacca* Cal 6-parted Cor 6-petalous, inserted into the calyx, bearing the anthers Stigma stellate. Berry dry, hexangular, many-seeded
759 *Aspidistra* Cor 1-petalous, 6-fid, equal Anthers at bottom of tube. Style stipitate. Stigma clypeate.
760 *Juncus.* Sepals 6, persistent. Stigmas 3 Caps 1-celled, 3-valved Seeds very numerous
761. *Luzula.* Sepals 6 Stigmas 3. Caps 1-celled, 3-valved, 3-seeded Seeds fixed to a central receptacle.

C *Perianth not colored, regular. Frust, a drupa Stems arborescent* Palms

762. *Corypha* Cal 3-leaved Cor of 3-petals Berry 1-seeded Seed large, round, bony
763 *Licuala* Cal 3-parted Cor 3-parted Cup truncated, band-like Drupe 1-seeded.
764. *Thrinax.* Cal. 6-toothed. Cor 0 Stigma funnel-form, oblique Berry 1-seeded.

D *Perianth partly or wholly colored, regular*

765 *Tradescantia* Cal 3-leaved. Petals 3 Filaments with jointed hairs Caps 3-celled.
766. *Dichorizandra* Cal 3-leaved Petals 3 Two of the stamens separate from the rest. Caps. 3-celled.
767 *Agapanthus* Flower funnel-shaped, regular, six-parted Stamens declinate
768. *Blandfordia* Flower tubular, withering, with a 6-lobed mouth Stamens inserted on the tube. Anthers fixed to a base like an extinguisher Ovary stalked Stigma simple Capsule 3-partible Seeds in two rows, with a loose downy skin
769 *Hemerocallis* Flower campanulate, with a cylindrical tube Stamens declinate Stigma small, simple, villous
770 *Aloe* Flower tubular, with a 6-cleft spreading mouth, and honey at the bottom of the tube Filaments inserted into the receptacle Caps 3-celled, 3-valved, many-seeded. Seeds in two rows, with a membranous edge
771 *Lilium.* Sepals 6, campanulate, with a longitudinal honey-line, and generally reflexed. Valves of the capsule connected by a mesh of hairs
772 *Tulipa* Sepals 6, campanulate Style 0
773 *Fritillaria* Sepals 6, campanulate, with a honey-pore above the claws
774. *Dracæna* Flower 6-parted, erect Filaments thickest in the middle, or simple. Berry 3-celled, 1-seeded
775 *Phylloma* Flower 6-parted, tubular Sepals imbricated Stamens hypogynous, included. Style setaceous Stigma simple. Berry coriaceous, many-seeded.
776 *Aletris* Flower funnel-shaped, wrinkled. Stamens inserted into base of segments Capsule 3-celled, with many seeds
777 *Tritoma* Flower 6-toothed Stamens inserted into the receptacle, exserted, alternately longer Capsule 3-celled, many-seeded
778 *Veltheimia* Flower tubular, 6-toothed Stamens inserted in the tube Caps membranous, 3-winged, with 1-seeded cells
779 *Sansevera* Cor monosepalous, with a filiform tube, and a 6-parted revolute limb Stamens inserted into the limb Berry 1-seeded.
780 *Tulbaghia* Flower funnel-shaped, with a 6-cleft limb Crown of the throat 3-leaved, the leaves bifid as large as the segments
781 *Yucca* Flower campanulate, spreading Style 0 Caps 3-6-celled, with a hole at the end
782 *Erythronium* Sepals 6, campanulate Two little tubercles attached to the base of every other sepal
783 *Gloriosa* Sepals 6, wavy, reflexed Style oblique, trifid at end
784 *Bulbocodium* Sepals 6, funnel-shaped, with narrow claws bearing the stamens
785 *Uvularia* Sepals 6, erect A hollow at the base of the sepals Filaments very short. Flowers solitary, axillary Capsule compressed, 3-cornered Seeds with an arillus
786 *Streptopus* Sepals 6, campanulate Stigmas very short Berry globose, polished, papery Seeds naked
787 *Convallaria* Flower 6-cleft, campanulate Berry spotted, 3-celled
788 *Smilacina* Flower 6-parted, spreading Filaments diverging, fixed to the base of the segments. Berry globose, 3-celled Flowers terminal, panicled, or umbelled
789 *Polygonatum* Flower 6-cleft, cylindrical Filaments inserted into top of tube Berry globose, 3-celled, with 2-seeded cells Flowers axillary
790 *Ophiopogon* Flower half superior, persistent Anthers sessile Stigma simple Berry 1-seeded
791 *Eucomis* Flower 6-parted, persistent, spreading Filaments united at base into a circle Capsule 3-celled Seeds ovate Scape with a leafy crown
792 *Brodæa* Flower campanulate, 6-parted Filaments inserted into the throat. Ovary stalked Capsule 3-celled, with many-seeded cells
793 *Pelionanthes* Flower rotate, 6-parted, sepals vaulted at base Ovary 3-celled, with 2-seeded cells
794 *Aphyllanthes* Spathe glumaceous, imbricated Flower 6-parted, with a spreading limb Capsule 3-celled, 3-valved, many-seeded
795 *Sowerbæa* Sepals 6 Filaments 3, each bearing two anthers, with three sterile filaments between them.
796 *Allium.* Flower 6-parted, spreading. Spathe many-flowered Umbel clustered
797 *Albuca* Sepals 6 the inner conniving, the outer spreading, generally with a green stripe at their back Style 3-cornered Seeds flat.
798 *Xanthorrhœa* Sepals 6, persistent. Filaments flat, naked Caps 3-cornered Seeds two, compressed, edged
799. *Thysanotus* Flower 6-parted, spreading, persistent, with the inner segments fringed Stamens 6-declinate Filaments smooth Ovary with two seeded cells Seeds 2, one erect, one pendulous
800 *Ersospermum* Sepals 6, campanulate, persistent. Filaments dilated at base Caps. 3-celled. Seeds enveloped in wool
801 *Gagea* Stamens adhering to base of sepals Style clavate Caps. 3-celled, 3-valved, covered by the remains of flower. Seeds small, numerous, round
802 *Ornithogalum* Sepals 6, erect, persistent, spreading above the middle Filaments dilated at base, or subulate Caps roundish, angular, 3-celled. Seeds roundish, naked Flowers white or green.
803. *Scilla.* Sepals 6, spreading, deciduous Filaments filiform, attached to base of sepals. Flowers blue or pink
804. *Puschkinia* Flower 6-parted. Cup very short, 6-toothed, covering the throat Stamens within the cup
805. *Massonia.* Limb of flower 6-parted. Filaments attached to the neck of the tube. Capsule 3-celled 3-winged, many-seeded.

806. *Eremurus.* Sepals 6, after flowering, rolled together. Stamens naked, rolled together inside the flower, barren, much exserted. Style after fecundation reflexed.
807. *Bulbine.* Sepals 6, spreading. Filaments smooth. Caps. ovate. Seeds angular. Leaves flat Flowers generally white or purple.
808 *Asphodelus.* Flower 6-parted, spreading. Six valves covering the ovary.
809 *Anthericum.* Sepals 6, spreading. Filaments bearded. Caps ovate. Seeds angular Leaves succulent, fistular. Flowers yellow.
810 *Arthropodium* Sepals 6, spreading: the three inner wavy at the edge or fringed Filaments bearded Capsule nearly round.
811. *Chlorophytum* Flower 6-parted, spreading, equal, persistent Stamens 6. Filaments filiform, smooth Ovary with many-seeded cells Style filiform Stigma 1. Capsule deeply 3-lobed, with compressed veiny lobes, three-celled, 3-valved. Seeds few, compressed
812 *Cæsia* Flower 6-parted, spreading, equal, deciduous Stamens 6. Filaments beardless, narrowe at each end. Anthers inserted by an emarginate base Ovary 3-celled, with 2-seeded cells. Style filiform. Capsule lobed, or clavate at end Seeds ventricose.
813. *Narthecium.* Sepals 6, spreading, persistent. Filaments filiform, hairy. Caps prismatical. Seeds with an appendage at each end.
814 *Dianella* Sepals 6, spreading Filaments thickened at end Berry 3-celled, many-seeded.
815 *Eustrephus.* Flower 6-parted, the 3 inner sepals fringed Capsule berried, 3-celled, 3-valved, many-seeded.
816 *Asparagus.* Flower 6-parted erect, the 3 lower sepals reflexed at end Berry 3-celled, many-seeded
817. *Drimia.* Flower campanulate, 6-cleft, with revolute segments Stamens inserted into the sepals. Stigma capitate
818 *Uropetalon.* Flower six-cleft, with the alternate segments shortest Capsule membranous Seeds black, shining
819. *Hyacinthus* Flower erect, 6-cleft, with equal segments Stamens inserted in the middle of the flower. Cells of capsule 2-seeded.
820 *Zuccagnia* Sepals cylindrical the 3 outer longest, lanceolate, setaceous, reflexed The other characters of Hyacinthus
821. *Muscari.* Flowers ovate or cylindrical, very shortly divided The other characters of Hyacinthus
822. *Lachenalia* Sepals 6, obtuse, the 3 inner the longest. Stamens erect Capsule 3-winged Seeds globose
823 *Phormium* Sepals 6, the 3 inner the longest. Stamens ascending, exserted Capsule oblong, 3-cornered. Seeds compressed
824 *Cyanella* Sepals 6 the 3 lower hanging down Style and lowest stamen declinate Capsule roundish, 3-celled.

3 *Dicotyledons*

825 *Leontice.* Cal. 6-leaved, deciduous Petals 6 Six leaves inserted upon the claws of the corolla, spreading at end.
826 *Caulophyllum.* Cal. 6-leaved. Petals 6, opposite the calyx Cells of anther opening at edge
827 *Diphylleia* Cal 3-leaved, deciduous Petals 6, opposite the calyx Anthers opening with a membrane dividing from the base to the tip Berry 1-celled Seeds 2-3, roundish
828 *Prinos* Cal 6-cleft Cor monopetalous, rotate Berry 6-seeded
829 *Berberis* Cal. 5-leaved. Petals 6, with glands upon their claws Style 0 Stigma umbilicate. Berry 1 celled, 2-4-seeded
830 *Nandina* Cal many-leaved, imbricated Petals 6 Berry juiceless, 2-seeded
831 *Cossignia* Cal. 5-parted. Petals 4 or 5 Capsule 3-celled, opening at end with about 3-seeded cells. Flowers in panicled racemes
832 *Hillia* Cal. double, the lower 6-leaved, the upper superior, 2 or 4-leaved Cor 6-cleft, with a very long cylindrical tude Anthers sessile, in the throat of the corolla Seeds comose
833 *Richardia* Cal 6-parted, persistent, superior Cor funnel-form, 6-cleft Stigmas 3, capitate Fruit 3-partible Seeds 5, truncate
834 *Canarina.* Cal 6-leaved. Cor 6-cleft, campanulate Stigmas 6 Capsule inferior, 6-celled, many-seeded.
835 *Frankenia* Cal. 5-cleft, funnel-shaped Petals 5. Stigma 2-3-parted. Caps 1-celled, 3-valved
836 *Peplis* Cal. campanulate, with a 12-cleft mouth Petals 6 or 0, inserted in the calyx Caps 2-celled, many-seeded.

Order 2. DIGYNIA  6 Stamens. 2 Styles

837 *Oryza* Glumes 2, 1-flowered Paleæ 2, nearly equal, adhering to the seed
838 *Atraphaxis* Cal 2-leaved Petals 2, sinuated Stigmas capitate. Seed 1.

Order 3 TRIGYNIA  6 Stamens 3 Styles

1 *Monocotyledons*

839 *Flagellaria.* Sepals 5 Berry 3-1-seeded
840 *Scheuchzeria* Sepals 6 Anthers linear Stigmas sessile, lateral Capsules inflated, distinct, 2-seeded.
841 *Triglochin.* Sepals 6, the 3 outer in a different row from the inner Style 0. Capsule opening by the base.
842. *Lichtensteinia* Sepals 6, withering, persistent, wavy, spreading Stamens hypogynous, shorter than the sepals Capsule many-seeded, half 3-valved.
843 *Myrsiphyllum* Flower 6-parted, revolute Styles 3, contiguous, straight Ovary stalked. Berry 3-celled, with 2-seeded cells
844 *Tofieldia* Bracteæ 3 Sepals 6. Capsules 3, superior, united at the base, many-seeded
845. *Melanthium* Polygamous. Flower rotate, 6-parted, with 2 glands at the base of each segment. Filaments from the elongated claws of flower. Capsule 3-fid, 3-celled Seeds membranous
846 *Medeola* Flower 6-parted, revolute Berry 3-seeded.
847 *Xerophyllum* Flower 6-parted Stigmas 3, oblong, sessile. Caps 3-celled, with 2-seeded cells
848 *Wurmbea* Flower 6-parted, with an hexangular tube. Filaments inserted in the throat. Styles conniving Caps. oblong, 3-cornered. Seeds round.
849 *Androcymbium.* Sepals 6, unguiculate, cucullate Stamens inserted in the middle of sepals. Ovaries 3. Styles filiform.
850. *Trillium.* Cal. spreading, 3-leaved. Petals 3 Berry 3-celled.
851 *Colchicum.* A spatha. Flower 6-parted, with a tube proceeding directly from the root. Anthers incumbent Caps 3, connected, inflated.
852 *Helonias* Sepals 6. Styles 3, distinct. Capsule 3-celled, 3-horned, few-seeded.
853 *Nolinea* Flower 6-parted, spreading Style very short. Capsule 3-cornered, membranous, 3-celled, opening by bipartible dissepiments Seeds solitary, convex on one side.
854. *Aponogeton.* An amentum composed of scales. Neither calyx nor corolla. Capsules 4, 3-seeded. Stamens varying from 6 to 7 and 12

855. Sabal Spathes partial Filaments free, thickened at base Berry 1-3-seeded. Seed bony. Embryo lateral. A palm.

2. Dicotyledons

856. Rumex Calyx 3-leaved. Petals 3, conniving Seed 1, 3-cornered.
857. Oxyria. Calyx 2-leaved. Petals 2 Styles 2.

Order 4. POLYGYNIA. 6 Stamens. Many Styles.

858. Wendlandia Sepals 6. Petals 6, succulent Style reclinate Caps 6, 1-celled, many-seeded.
859 Damasonium Spathe 1-leaved, half-bifid, winged Flowers superior, 6-parted, with the 3 inner segments petaloid Stamens 6-12 Ovary with 6-8-parietal prominent placentas Style short. Stigmas 6-12
860 Actinocarpus Flower 6-parted the 3 outer sepals falling off late, the inner petaloid. Stamens 6. Ovaries 6-8, connate at base, 2-seeded Capsules connate at base, stellate above
861 Alisma Flower 6-parted the 3 outer sepals falling off late, like a calyx, the 3 inner petaloid. Stamens 6. Ovaries indefinite in number, 1-seeded. Capsules distinct, not opening.

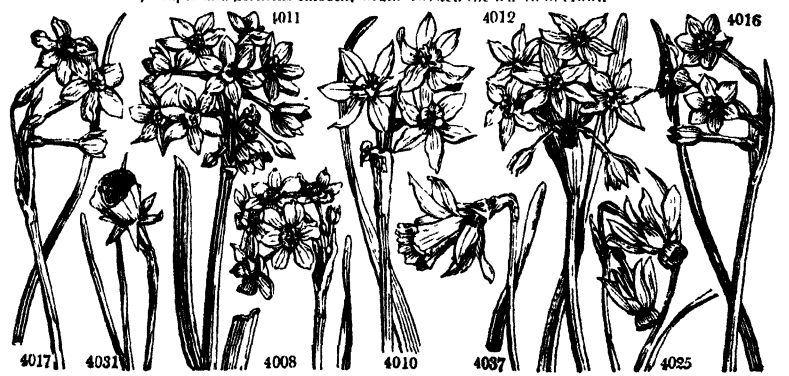
History, Use, Propagation, Culture,



711. *Narcissus* From ναρκη, *stupor*, on account of the dangerous effects produced by the smell, even of the least perfumed kinds, upon the nerves For this reason Narcissus was consecrated to the Furies, who by means of it were accustomed to stupify those whom they wished to punish *Jonquilla*, a name applied to one

MONOGYNIA.

3997 Segm refl imbr. at base, Cup expanded flat, Three anthers shorter than the tube, Leaves erect narrow
3998 Lvs. ½ an inch broad glauc. at end rec. Seg imbr Cup plait with scarlet rim, Stig. as long as inner stamens
3999 Lvs. erect glauc. Seg imbric. with deflexed edges, Cup yel minutely plaited, Stig. as long as inner stamens
4000 Seg horizontal obo not imbric Cup saucer-shaped with very red edge, Lower anth half included in tube
4001 Scape kneed before flowering usually 2-3-flowered, Cup all yellow
4002 Very slender, Spathe 1-2-fl Seg white, Cup yellow cup-shaped 3 or 4 times as long as segm
4003 About 3-flowered, Seg reflexed white, Cup spreading plaited crenulate yellow
4004 Like N Tazetta, differing in the 3-lobate cup, and in the edges of the upper leaves not being turned up
4005 Flowers about 16, Seg round oval reflexed incurved white, Cup large straight yellow entire
4006 Segm white almost twice as long as the straight inflated nearly entire yellow cup
4007 2-3-fl Cup very large thick truncate entire waxen twice as short as white segm
4008 Spathe many-flowered, Cup camp truncate shorter than petals, Leaves flat
4009 Spathe 1-2-fl Scape compr 2-edged, Sepals spread imbricated a little longer than truncated entire cup
4010 About 10-fl Seg white round ov. thrice as long as pale yel spread irreg cut cup, Scape striat rounded
4011 Few-flowered, Seg stellate as long as tube, Cup cupulate crenate, Style within the crown
4012 Many-flowered, Cor bent back, Segm stellate, Cup spreading cupulate slightly trifid
4013 About 6-fl Seg round-ovate imbr white, Cup citron spreading entire or lobed, Scape rounded below
4014 Many-fl Pedunc nearly erect, Seg imbr 3 times as long as the erect eroded cup, Lvs remarkably broad
4015 Scape obtusely compressed smooth, Segm very yellow ovate imbr 3-4-times as long as cup
4016 Like the last, but the cup is more entire and the leaves broader
4017 Spathe 1-3-flowered, Seg reflexed spatulate, Cup much shorter than seg saucer-shaped spreading crenate

4018 12-18 inches high, Lvs linear subulate chann Scape rounded 1-2-fl Ovary inflated, Fl. sulphur-colored
4019 Leafless at flowering, Flowers green with acute segm
4020 Spathe 1-flowered, Cup 6-parted very short, Leaves subulate
4021 About 3-flow Cup obsoletely curled outside obtusely angular not twice as short as seg Scape 1½ ft high
4022 Segm of starry cor distinct at base, Cup even distinctly 6-lobed
4023 About 2-fl Seg refl pale yellow, twice as long as cup which is deeper col trun cylind. Style exserted
4024 A slight variety of N incomparabilis
4025 1-7-fl Leaves erect, Segm reflexed lanceolate longer than cup which is cyathiform 6-fid repand
4026 All white, Cup twice as short as segm which are reflexed
4027 A very obscure plant of which no description is anywhere given
4028 Cor. pendulous white with straight half-expanded segm Cup cyathiform with a crenulate mouth
4029 Segm twisted stellate, Cup cyathiform much plaited twice as short as segm
4030 Sulphur-colored or nearly white, Cup turgid entire as long as segm Style protruded, Leaves obtuse
4031 Flower yellow, Crown turgid truncate entire, Style included, Leaves erect before flowering
4032 Fl yel Crown inflated at the end contracted entire, Style exserted, Lvs always spreading on the ground
4033 Crown undulate lobed at end, Style included
4034 Crown deeply 6-lobed, Style very long, Leaves shining erect before flowering
4035 Segm sulphur, Crown campanulate yellow at the end spreading 6-lobed, Lobes imbricated
4036 Leaves flat and scape striated, Segm much twisted shorter than crown, Germ 6-furrowed
4037 Leaves twisted, Scapes and germens smooth, Segm twisted the length of crown

and Miscellaneous Particulars.

of the species, is a diminution of *juncus*, a rush, as *Tazzettas* of *taxus*, the Italian name for a cup This is a popular flower of great beauty, some species very fragrant, and all of them of the easiest culture. They also force well, either in pots of earth or on glasses of water Their forcing may be greatly accelerated by retard-

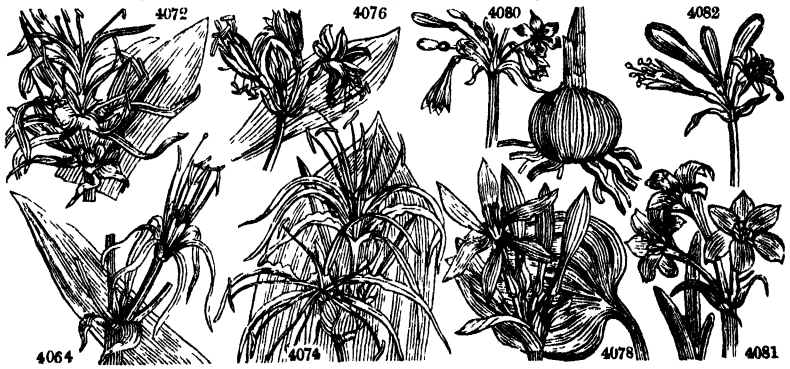
History, Use, Propagation, Culture,

ing the bulbs one season in an ice-house Many fine bulbs of this genus, are annually imported from Holland, and some from Naples, especially the italicus, which grows wild round that city in great beauty The genus has been injudiciously separated into several by Haworth, whom however no one has followed.

712. *Pancratium.* A name given by the Greeks to a kind of Scilla The word signifies all-force, from παν and κρατος, in allusion to its powerful effects in medicine. This is a free-flowering genus, several of the species are very handsome and fragrant, and are met with in most collections of stove plants A mixture of light loam and rich vegetable mould suits them best, and care must be taken not to give them much water, when they are not in a growing state They are to be increased by suckers, or from seeds, which often ripen freely. If any plant happen to lose its heart, if it be kept dry, it will throw out abundance of suckers, which is the readiest way of propagating it. (*Bot Cult* 89) P maritimum, illyricum, and carolinianum, are hardy; the other species are stove-plants. P. amancaes has yellow flowers, and is not less beautiful than rare.

4038 Scape striated compressed, Segm. flat · the outer ovate acuminate not so long as the serrated crown
4039 Scape smooth compressed, Crown very yellow deeply 6-cleft spreading, Segm ½ erect lanceolate
4040 Scape two-edged straight striated, Segm. sulphur, Crown yellow with serrate crenate orifice
4041 Segm. incurved horizontal a little twisted, Crown funnel-shaped ventricose at base very short
4042 Like the last, but the crown is yellow, the segm of flower yellowish
4043 Spathe 1-fl Scape 2-edged, Cup columnar plaited shorter than the sepals, Tube about as long as sepals
4044 Scape 2-edge nearly trian Spat. 1-2-fl Seg of cor lanc. acute, Crown plaited crenate thrice as long as limb
4045 Segm half as long as tube ovate, Crown funnel-form 6-cleft plaited upwards
4046 Leaves twisted very glaucous, Crown campanulate very large very open at orifice
4047 Segm. ½ erect twisted incurved spreading, Crown as long as segm deeply and irregularly cut
4048 Scape deeply striated, Seg much spread twisted ellipt. shorter than crown which has a very open orifice
4049 Scape deeply striated, Mouth of crown 6-cleft expanded deeply and irregularly crenate
4050 Pet. narrow obcuneate not imbricating at base, Crown 6-cleft at mouth spreading minutely rugose
4051 Spathe 1-flowered, Crown curled waved lobed, Scape 6 inches high

4052 One-flowered, Leaves lig lanc. Segments of limb longer than tube, Stamens incurved conniving
4053 Spathe 2-4-fl. Lvs lin acute, Limb of cor shorter than tube, Altern div of crown deeper, Stam. incurved
4054 Many-fl Lvs. sheath downw very glauc. with an obt point, Cr. much unit. to turb limb, Anth. bent inw
4055 Many-flowered, Leaves neither glaucous? nor sheathing downwards, Anthers incumbent
4056 Many-fl Lvs strap-shap somew glauc obt Tube twice as short as limb, Fil. not longer than teeth of cr.
4057 Many-fl Lvs strap-shap. ccs Scape 2-edged, Pet lanc conv longer than tube, Cr short with very deep div
4058 Many-fl Leaves bright-green, Tube as long as stellate nodding limb, Stamens short abruptly bent inwards
4059 1 or many-fl Spat. herb. Limb erect turb a little shorter than blunt. 3-cor tube, Cro not much shorter than
4060 Few-flowered, Leaves obt Spathe dry, Cor nodding, Anthers longer than filaments [limb
4061 Lvs stalked ellip shortly pointed, Scape compressed, Petals linear wavy, Racemes of crown 1-toothed
4062 Many-flowered, Leaves many lorate narrowed each way, Tube rounded twice as long as limb
4063 Leaves lanc lorate, Petals little shorter than tube, 5 times as long as crown
4064 Many-fl Lvs lorate with long points shin Petals spread longer than tube 3 times as short as nar crown
4065 Two or many-flowered, Leaves linear-lorate obtuse many, Crown turbinate rotate longer than filaments
4066 Two-flowered, Lvs few linear-lanceolate with long points, Crown rotate turbinate longer than filaments
4067 Many-flowered, Leaves oval-oblong stalked, Spathe 4-valved, Cup narrow 4 times as short as the limb
4068 Lvs broad-lin Flowers many sessile with linear straightish segments longer than tube, Crown obconical
4069 Leaves lanceolate dark-green, Flowers a foot long, Stamens short
4070 A slight variety of P amœnum, No. 4073
4071 One or 3-fl. Leaves linear cuneate, Tube as long as lin petals, Seg of crown eroded, Fil length of crown
4072 Many-fl Lvs many lin lanc Tube twice as short as limb, Cr twice as short as stam. with 1-tooth recesses
4073 Lvs. many oval-lanc 3 or 4 times as broad as stalk, Umbel sessile spreading, Tube shorter than limb
4074 Compactly many-fl Lvs oval stri nar each way, Tube round. nearly as long as limb, Teeth of crown entire
4075 Lvs many lanc elliptical with a point three times as broad as their stalk, Tube twice as short as limb



4076 The only species

4077 Leaves stalked cordate rounded with concentric distant nerves
4078 Like the last, but is smaller with a 6-parted crown

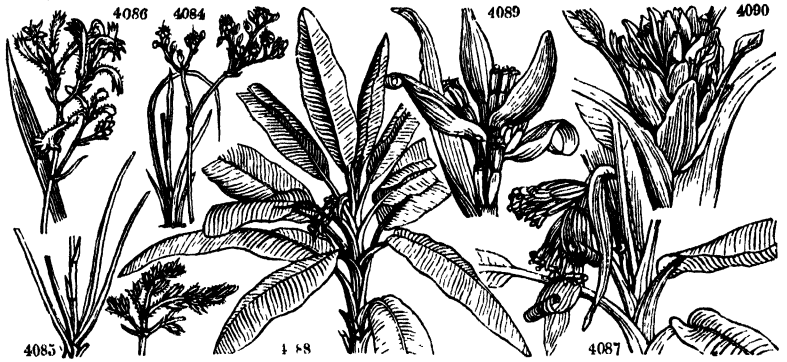
4079 Flowers yellow
4080 Flowers purple

4081 A small plant with bright yellow flowers appearing before the leaves

4082 Leaves linear ligulate, Flowers 6-7-cylindrical, with oblong obtuse segments
4083 Leaves oblong lanceolate stalked, Flowers 2 campanulate funnel-shaped

and Miscellaneous Particulars

713 *Eucrasia* From ευ, well, and κρασπεδον, a fringe, in allusion, we presume, to the beautiful fringe to the flower, formed by the cup of united stamens A pretty half-hardy bulbous plant, extremely rare.



714 *Eurycles* From ευρυς, wide, and κλεισμα, a portion of a thing, in allusion to the broad divisions of the crown A genus formerly included in Pancratium, from which it is distinguished not only by its flowers, but by its broad leaves, which are like those of the Hemerocallis

715 *Calostemma* From καλος, beautiful, and στεμμα, a crown, in allusion to the beauty of the colored corona of the flower. Very pretty New Holland bulbs, requiring the cultivation of other greenhouse bulbs

716 *Chisdanthus.* From χλιδωσος, delicate, and ανθος, a flower, on account of the delicate color and texture of the beautiful yellow flowers. The plant requires a stove, and produces the scape before the leaves

717 *Chrysiphiala* So named by Mr Ker, in allusion to the golden cup-like flowers, χρυσος, gold, and φιαλη, a goblet Bulbous plants from the same country and with the same habits as the last.

History, Use, Propagation, Culture.

718 *Lophiola* From λοφια, a crest, on account of the little crest of the petals It is a very rare North American plant, and thrives best in pots set in saucers of water

719 *Argolasia* From αργος, white, and λασιος, wool, on account of its calyx, which is white and velvety on the outside. It requires the same culture as the last

720 *Anigozanthus* Named by Labillardiere, from ανιστχω, to raise up, and ανθος, a flower Its flowers are raised upon very long conspicuous scapes Curious New Holland plants, with yellow or green flowers

721 *Musa.* So named by Plumier, in memory of Antonius Musa, the brother of Euphorbus, and the the freedman of Augustus. Such is the sense in which Linnæus admits the word. But the Arabic name for the plant, *mauz*, is a much more likely derivation This splendid genus consists of species which have perennial, roundish, solid, watery bulbs, with biennial, and sometimes longer enduring stems The stems are straight, erect, varying from five to twenty-five feet in height, simple, thick, round, smooth, fungous, watery, and lamellated The leaves are oblong, entire, from three to ten feet in length, and under two feet in width The flowers are in large terminating racemes, without a calyx or perianthium, generally whitish the fertile flowers occupying the lower, and the barren the upper, part of the raceme The former are succeeded by oblong, angular, fleshy berries, sweet, eatable, and containing many black seeds They are natives of the old world, and for the most part cultivated there: none appear to be natives of America.

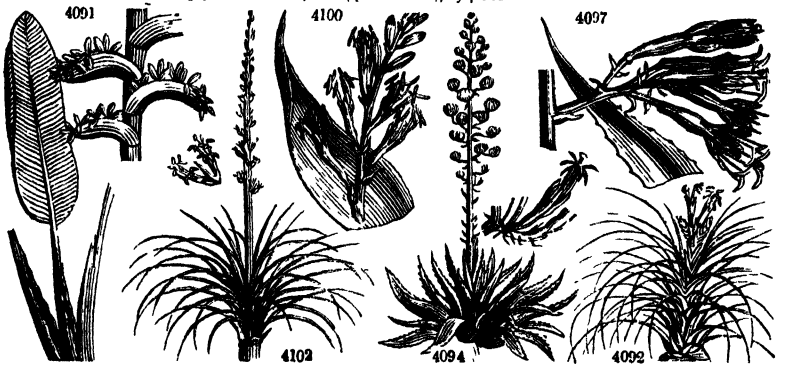
M paradisiaca rises with a soft herbaceous stalk fifteen or twenty feet high, with leaves often more than six feet long, and near two feet broad When the plant is full grown, the spike of flowers appears from the centre of the leaves, it is near four feet in length, and nods on one side The fruit which succeeds the fertile flowers on the lower part of the spike is eight or nine inches long, and above an inch in diameter, a little incurved, with three angles, at first green, but when ripe of a pale yellow color The skin is tough, and within is a soft pulp of a luscious sweet flavor The spikes of fruit are often so large as to weigh upwards of forty pounds Gerarde, and other old authors, name it Adam's apple, from a notion that it was the forbidden fruit of Eden, whilst others supposed it to be the grapes brought out of the promised land by the spies of Moses. It is certainly one of the most useful fruits in the world, and seems to have migrated with mankind into all the climates in which it can be cultivated The fruit is so much esteemed by all Europeans who settle in America, that the first thing they do in establishing a plantation is to begin with a Plantain walk, enlarging it as their family increases Some or other of the trees are bearing most part of the year, and their fruit is often the whole food on which a family subsists When used instead of bread, it is roasted or boiled when just full grown it is also eaten boiled with salt-meat or fish, and when ripe it is made into tarts, sliced and fried with butter, or dried and preserved as a sweetmeat A fermented liquor is made from them, and in some places a cloth from the fibres of the trunk, the leaves make excellent mats, or serve for stuffing mattrasses. Long (*Jam* 788) says, this fruit and the banana are among the greatest blessings bestowed by Providence upon the inhabitants of hot climates Three dozen plantains are sufficient to serve one man for a week instead of bread, and will support him much better

M. sapientum is by some considered a variety of the plantain, from which it differs in having its stalks marked with dark purple stripes and spots The fruit is shorter and rounder, with a softer pulp, of a more luscious taste An excellent marmalade, and a drink like the best Southnam cider, are made from it. There are many varieties both of the plantain and banana

M. rosacea and coccinea, are very ornamental plants, on account of the color of the flowers, but scarcely to be distinguished from M. paradisiaca. The culture of all the species is easy in lofty houses, with abundance

4084 The only species

4085 Leaves linear carinate smooth, Scape angular corymbose, Flowers woolly



4086 Stem and leaves smooth, Down of branches deciduous, Anthers with a reflexed end

4087 Spadix nodding, Male flowers persistent
4088 Stem spotted, Spadix nodding, Male flowers deciduous
4089 Spadix nodding or erect, Male flowers deciduous, Spathes elliptical obtuse, Fruit oblong
4090 Spadix erect, Flowers capitate, Spathes clustered scarlet very large yellow at end

4091 A plant like a Banana

4092 Leaves multifarious cæspitose recurved very narrow and rigid

4093 Lvs lorate atten erect recurved glaucous above chan with marginal minute dense white serrulations
4094 Stemless, Lvs toothed spiny, Scape branched, Tube of cor contracted in middle, Stem longer than cor.
4095 Leaves toothed spiny, Scape quite simple
4096 Leaves narrow lanceolate flaccid recurved, Spines marginal minute
4097 A little stemmed, Leaves toothed spiny, Scape branched, Stam. longer than cylind. cor
4098 With a stem, Leaves narrow lanceolate glaucous tooth-serrated
4099 Leaves erect bright green with an entire brown edge
4100 Stemless, Leaves toothed, Scape branched, Tube of cor narrowed in middle, Stem as long as cor.
4101 Stemless, Leaves cartilaginous sawed, Scape simple
4102 Leaves threadly at edge, Flowers of spike approximating by pairs

and Miscellaneous Particulars

of room for the roots, and a rich loamy soil kept rather moist. A plant of the banana was planted in the pit of a stove about 1811 "It was then about six feet high, with a single stem In each succeeding year it has produced a bunch of fruit, and in 1819 two bunches, the first ripe in May, the other in August, having about four dozen of fruit on each bunch The plant is now sixteen feet high, and measures three feet round at the bottom" (*Hort Trans* iv 138)

722 *Urania* A name of one of the muses, unjustifiably applied to this genus by Schreber, in the room of that of Ravenala, which it bears in Madagascar To grow this plant luxuriantly, a strong heat and a good supply of water are required Fresh imported seeds will grow freely

723 *Buonapartea* So named by the authors of the Flora Peruviana, after Napoleon Bonaparte, emperor of the French. Fine plants like Bromelia, with long, narrow, recurved leaves, and spikes of simple blue flowers, which were never yet seen in this country

724 *Agave* Altered from αγαυος, admirable, which this genus may well be said to be, considering its appearance, its size, and the beauty of its flowers. In mythology, Agave is the name of one of the Nereids A americana is a popular succulent throughout Europe It grows wild or is acclimated in Sicily, the south of Spain, and Italy, and is much used in the latter country, planted in vases as an ornament to piers, parapets, and about houses About Milan and other towns in Lombardy, where it will not endure the winter, they use imitations of copper so well formed and painted, as to be readily mistaken for the original In France and Germany it is still very common, and in this country formerly used to be the regular companion of the orange, myrtle, and pomegranate, then our principal greenhouse plants. An idea used to prevail that the American Aloe only flowered once in a hundred years, but, independently of this unnatural application of time to the inflorescence, it has long been known to flower sooner or later, according to the culture bestowed on it. Many have flowered within these few years in this country, and if the plant had the same treatment as the pine-apple, it would probably flower nearly as often There is a variety with striped foliage, and sometimes the stripes are of different shades of white, yellow, and red, as in the queen pine-apple. There are hedges of the plant in Spain, Portugal, Sicily, Calabria, and the West Indies. According to Long, (*Jamaica*, iii 710) the leaves are useful as a succedaneum for soap. For this purpose, after being cut, they are passed between the rollers of a mill with their point foremost, and the juice being conducted into wide shallow receivers, through a coarse cloth or strainer, it is exposed to a hot sun, until the aqueous part being exhaled, it is reduced to a thick consistence It may then be made up into balls, with the help of ley ashes. It will lather with salt water as well as fresh This soap may also be prepared by pounding the leaves in a wooden mortar, and then expressing the juice, which may be brought to a consistence by the sun or by boiling One gallon of juice thus prepared, will yield about one pound of a soft extract. The juice, in both these ways, must be carefully strained, and the extract must never be combined with tallow or other unctuous materials The leaves are also used for scowering pewter, and other kitchen utensils, and floors The inward spongy substance of the decayed stalk is used for tinder The fibres of the leaves, separated by bruising and steeping in water, and afterwards beating them, make a strong thread for common uses. All the species greatly resemble each other, and it is doubted, whether, in the works of several travellers, different species of Agave Aloe, and even Bromelia, are not confounded in their descriptions of their uses. There is, for example, a variety of the Agave americana, called Karatas by Long, and there is a species of Bromelia of that designation, hedges of Karatas are frequently mentioned without noticing the generic name of the plant.

History, Use, Propagation, Culture,

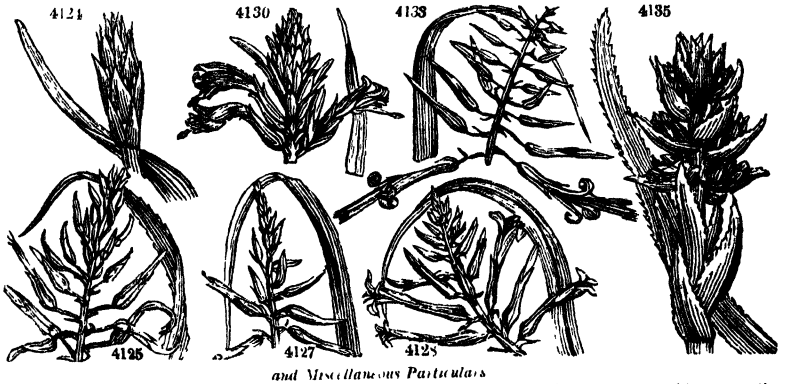
725 *Furcræa* Named in honor of M Fourcroy, the famous French chemist A noble genus resembling the last

726 *Bromelia* So named by Linnæus, in memory of Olaus Bromel, a Swede, author of Lupulogia, and other works, 1694, &c *Ananas*, Fr, Ger, and Ital., and *Nanas* among the Peruvians, where it was originally found by Europeans This fruit may, without hesitation, be pronounced the first in the world, though it has not been known in Europe above two centuries, and has only been cultivated about a century as a fruit plant in Britain It passed from Brazil to the West, and thence to the East Indies, where it has long been successfully cultivated About the middle of the seventeenth century it was brought to Holland, by Mr La Court, a merchant, and cultivated at Driehoek, his seat, near Leyden; and from thence it was imported into this country, and first fruited by Sir Matthew Decker, at Richmond, about 1715, or earlier La Court began by growing his pines without bottom heat, as dry stove plants, but afterwards had recourse to low pits and tanner's bark Plans of his pits, and an account of his mode of culture, are published in his work, entitled, Aenmerkingen over Lusthoven, Plantagion, &c (See *Ency of Gard* p 1120, Anno 1737.) Sir M Decker, Bradley informs us, adopted pits, and soon after pine stoves, or larger and more commodious pits, were, by the year 1730, in most of the first English gardens, and some also in Scotland, where the pine-apple was first fruited by Justice, at Crichton, near Edinburgh, in 1732 The pine is now cultivated very generally in Britain, in several places in Ireland, and at most of the capital cities on the continent In one or two of the southern provinces of Spain, it is grown in sheltered situations in the open air

There are many varieties of the pine in the West Indies, procured by raising from seed in this country there are upwards of thirty sorts, but the queen, New Providence, and one or two others, are most esteemed. The plants are propagated by suckers, and by that singular production, proceeding from the summit of the fruit, called a crown from large suckers fruit is sometimes obtained in eighteen months, but, in general, a period of two or three years is required, and for the New Providence sometimes longer Loamy soil well enriched with rotten dung, and the pots sufficiently drained, with abundance of heat without sudden extremes, will ensure large and well flavored fruit (See *The various Modes of cultivating the Pine-Apple from its first Introduction to the Improvements of Mr Knight*, &c 8vo 1822)

Some of the other species of true Bromelia have crowns, and the fruit of most of them is eatable, though small. B. Pinguin has the fruit separately in clusters, and not in a cone or pine, as in the Ananas. It is very common in Jamaica, in most of the Savannahs, and on the rocky hills It is used there for fencing pas-

4103 Leaves entire, Scape branched
4104 Root tuberous, Leaves very long spiny at edge
4105 Cor hexapetalous, Leaves ciliate spiny
4106 Leaves linear lanceolate entire upwards, at the base serrate spiny
4107 An obscure plant described by Haworth only and supposed to be *Doryanthes excelsa*!!



4108 Leaves fringed with spines mucronate, Spike comose
4109 Leaves at the end toothed spiny, Spike comose
4110 Leaves entire, Spike comose
4111 Leaves ciliated spiny mucronate, Raceme terminal
4112 Leaves ciliated spiny with a very long point, Raceme term. comp Flowers sessile shorter than bracteæ
4113 Leaves ciliated spiny with a very long point, Raceme rigid compound, Flow. in numerous lateral spikes
4114 Leaves erect, Flowers stemless sessile aggregate
4115 Radical leaves toothed spiny · cauline entire

4116 Panicle lax few-fl spreading, Peduncles 1-flowered, Upper spathes fertile as long as flower spreading
4117 Leaves serrate spiny, Bractes lanceolate toothed, Raceme compound shorter than leaves
4118 Leaves serrated spiny obtuse, Spikes alternate
4119 Leaves serrate spiny, Bractes ovate lanceolate, Scape elongated, Raceme compound
4120 Panicle diffuse, Leaves ciliate spiny mucronate recurved
4121 Raceme compound, Flowers heaped shorter than the long red entire bracteæ, Calyx acute
4122 Nearly stemless, Leaves aggregate sessile, Axillæ stoloniferous
4123 Leaves ligulate oblong very blue, Spike oval woolly with small sessile flowers

4124 Scape upright, Spike imbricated, The lower bracteæ green; the upper scarlet

4125 Leaves ciliate spiny, Peduncles and germens quite smooth
4126 Leaves ciliate spiny, Peduncles and germens downy
4127 Leaves narrow glaucous entire, Calyx villous
4128 Leaves entire somewhat spiny at base
4129 Leaves entire a little spiny at base, Bractes as long as peduncle and calyx
4130 Leaves entire white beneath, Raceme imbricated dense
4131 Leaves toothed spiny recurved, above shining smooth, beneath mealy
4132 Spike compound contracted, Leaves ensiform aculeate, Cor with a black spot at bottom
4133 Leaves linear lanc entire, Petals revolute, Stamens longer than cor

4134 Culm panicled
4135 Leaves upwards serrate spiny, Spike comose

and Miscellaneous Particulars

ture lands, on account of its prickly leaves These, stripped of their pulp, soaked in water, and beaten with a wooden mallet, yield a strong thread which is twisted into ropes and whips, and manufactured by the Spaniards into a good cloth The juice of the fruit in water makes a cooling draught in fevers, it is extremely diuretic, destroys worms, and makes a good vinegar

B Karatas, so called from its Brazilian name, *Karaguata-acanga*, generally grows at the root of some shady tree, in hilly and woody places in America and the Caribbee islands It is an elegant plant, producing numerous radical leaves, which are of a subulate-linear shape, sharp pointed and edged with spines The flowers are scentless, seated in the bosom or middle part of the plant, rose colored, with the calyx and germ downy The length of the leaves is six or seven feet. The fruits are oval, two or three hundred in number, and grow sessile in a heap or central group, surrounded by paleaceous expanded leaves or bractes; they contain a succulent whitish or yellowish flesh, under a coriaceous and yellowish bark When ripe, they are far from unpleasant, but when unripe they set the teeth on edge, and excoriate the mouth The economy of this plant in the preservation of its fruit to maturity is wonderful: being so protected by the spines of the surrounding leaves, as to be secure from all injuries

B humilis propagates itself by runners or shooting processes, which proceed from the axillæ of the lower leaves, and produce a young plant from their extremities.

Bromelia fastuosa is the most beautiful of the genus It has never flowered more than once in this country, when the figure in Mr. Lindley's Collectanea Botanica was obtained Bromelia sylvestris resembles this, but is less beautiful

727 *Guzmannia* Named after Anastatio Guzman, an industrious apothecary, and zealous collector of objects of natural history in South America. A beautiful evergreen herbaceous plant, with the foliage of Tillandsia, and a spike of bracteæ, the uppermost of which are richly colored with rose

728 *Pitcairnia* So named by Mons L'Heritier, in honor of William Pitcairn, M D an eminent physician of London, and a collector of foreign plants, particularly from the Alps. The species are remarkable for their long, narrow, green, prickly leaves, and for their uniform panicles of bright red. Pitcairnia staminea is very handsome. They require the same treatment as Bromelia.

729. *Tillandsia* So named by Linnæus, in memory of Elias Tillandsius, professor of physic at Abo, author

History, Use, Propagation, Culture,

of Flora Abocnsis, 1673 Several species of this genus are parasitical, and others require the same treatment as PILLARMIA or BROMELIA

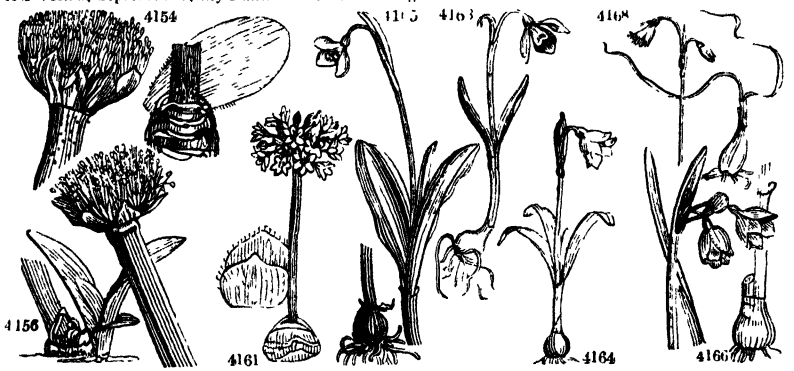
T. utriculata is a valuable plant in the woods of the West Indies, as containing a supply of water in dry seasons The seed being pappose, is carried about by the wind, and sticks readily on the bark of trees there, especially on decaying ones, it sends out small brown fibres which take hold of the bark, and weave and mat themselves among one another from this foundation rise several leaves on every side, like those of Aloes or Ananas, they are folded or inclosed one within another, each three feet and a half long, and three inches broad at the base, but ending in a point, having a very hollow or concave inward side, and a round or convex outward one, forming a bason or cistern, containing about a quart of water, which, in the rainy season falls upon the upper parts of the spreading leaves, and being conveyed down them by channels, lodges in the bottom as in a bottle, for the leaves, having swelled out at the base, bend inwards close to the stalk, thus hindering the evaporation of the water by the heat of the sun From the midst of the leaves rises a round, smooth, straight, green stalk, three or four feet high, having many branches, and when wounded yielding a clear white mucilaginous gum The flowers come out here and there on the branches The corolla is of a yellowish-white or herbaceous color, and the calyx is made up of three green viscid leaves with purple edges

Men, birds, and insects supply themselves with water from this plant Dampier says, he has many times, to his great relief, stuck his knife into the leaves just above the roots, and let out the water into his hat

T usneoides deserves, for its appearance and uses, to be shortly described. The stem is no bigger than a thread, the skin whitish, as if covered with hoar-frost, within tough and black like a horse hair. Many of these together stick on the branches of the ebony or other trees superficially by the mid-curled, or turning and winding one within another, and resembling an old man's beard, whence its common name in Jamaica The stems are branched, and the branches, which are two or three inches long, are set with roundish, white, frosted leaves The flowers come out at the end of the branches. This slender parasitical plant is found among the trees in many parts of Jamaica, but does not grow so commonly there, nor so luxuriantly, as it does in the more northern provinces of the main continent, where it is said to overrun whole forests. It is frequently imported from Jamaica to North America, for the use of the

4136 Leaves lanceolate channelled slightly prickly, outer acute inner retuse
4137 Filiform branched twisted rough
4138 Leaves lanceolate ligulate entire ventricose at base
4139 Leaves linear subulate entire imbricate, Spike lax

4140 Leaves narrow channelled recurved, Spike imbricated simple oval two-edged
4141 Spikes subdivided nodding, Flowers distinct ovate, Leaves ovate lanceolate membranous
4142 Leaves radical stiff frosted, Flowers imbricated in an ovate spike of whitish bractes
4143 Leaves subulate rough reclinate, Stems 1-flowered, Glumes 2-flowered
4144 Flower tubular trifid, Segments of the tripetaloid limb reflexed twice as short as tube, Lvs entire



4145 Leaves cordate, Flowers spiked
4146 Leaves long-triangular narrowed by degrees, at the base truncate cordate, Petals lin lanc
4147 Leaves sagittate obtuse, Flowers in crowded umbels
4148 Leaves lanceolate elliptical cordate, Spike oblong

4149 Leaves linguiform flat smooth pressed on the ground 2-ranked, Umbel shorter than the spathe
4150 Leaves linguiform oblong flat smooth callous at end, Umbel contracted shorter than spathe, Limb erect
4151 Leaves rounded fringed with pink hairs, Umbel few-flowered, Leaves of spathe cordate blunt
4152 Leaves oblong elliptical acute retuse wavy, Umbel contracted, Limb and stamens erect
4153 Leaves ellipt lanceol acute concave erect, Umbel longer than spatha, Limb spreading, Stam ascending
4154 Leaves linguiform flat smooth fringed at edge depressed, Umbel contracted, Limb and stamens erect
4155 Leaves lanceolate ciliated villous above smooth beneath, Spathe campanulate 4-valved
4156 Leaves oblong lanceolate hairy all over, Umbel fastigiate rounded, Limb and stamens erect

4157 Leaves broad much spotted with brown
4158 Lvs ellipt atten at base depressed flat smooth ciliated at edge, Pedunc longer than spathe and flower
4159 Leaves linear carinated
4160 Leaves linear lanceolate erect smooth, Peduncles length of spathe and flowers, Limb spreading
4161 Leaves 2 round ovate acuminate and scape hairy backwards, Spathe reflexed withered, Stam included
4162 Leaves oblong obtuse smooth erect not spotted, Umbel rounded, Limb erect

4163 Leaves smooth
4164 Leaves plaited

4165 Spathe 1-flowered, Style clavate
4166 Spathe many-flowered, Style clavate
4167 A slight variety of the last
4168 Spathe many-flowered, Style filiform
4169 Vernal, Sepals entire, Style filiform with a blunt stigma

and Miscellaneous Particulars

saddlers and coachmakers, who commonly stuff their pannels, cushions, &c with it In Louisiana and the neighbouring settlements, this plant being very carefully gathered and stripped of the bark, is made into mattrasses, cushions, pannels, &c It is manufactured by tying the stalks in bunches, and sinking them in water, or burying them under ground in a moist place, until the bark rots · they are then taken up, boiled in water, and washed, until the fibres are quite cleared of the pulp These are not only used instead of horse-hair, but are so very like it, that a man cannot distinguish them, without a strict examination, and that even with a glass, unless he observes the branchings of it

The Bonana bird's nest is always made of the fibres of this plant, and is generally found hanging by a few threads from the tops of the most expanded branches of the most lofty trees, especially those that spread over ponds or rivers

In cultivating Tillandsia in our stoves, the parasitical species may either be hung up in baskets of moss, or fastened in moss to some plant, or to the stump of a tree set up on purpose if planted in pots, they require but little water, and a sandy loam, with bits of sticks and small pieces of potsherds mixed with it. (*Sweet.*) They are, however, extremely difficult to manage under any mode of treatment.

730 *Pontederia* So named in memory of Julius Pontedera, professor of botany at Padua, author of Tabulæ Botanicæ, 1718, &c This is a genus of aquatic, herbaceous, perennial plants, with fibrous roots sheathing stem-leaves, and blue flowers in spikes or umbels from the cloven sheath of the leaves A loamy soil in a cistern of water grows them well, and they are not without beauty

731 *Hæmanthus* From αἷμα, blood, and ἄνθος, a flower, in allusion to the brilliant red colors of the flowers An ornamental genus, which thrives best in sandy loam and a little peat, and placed in a dry stove or bulb-house near the glass. The species require no water when in a dormant state, as the bulbs then ripen, and afterwards flower freely. (*Sweet*)

732 *Galanthus* From γαλα, milk, and ἄνθος, a flower, on account of the milky whiteness of the blossoms It is rather singular, and also to be regretted, that no variations or hybrids have been produced from this early and pretty little flower.

733 *Leucojum.* From λευκος, white, and ἰον, a violet A genus resembling the last in habit, but differing in technical characters. The little autumn species is very pretty, but difficult to cultivate.

History, Use, Propagation, Culture,

734 *Strumaria* From *struma*, a tubercle, a name given by Jacquin, on account of the swelling of the middle of the style Pretty little delicate plants, their culture as in Hæmanthus

735 *Crinum* Κρινον is Greek for a lily Its limits as a genus are defined by the hypocrateriform flower with linear reflexed segments Some unwise attempts have been made to destroy this distinction, by admitting into this genus plants with the characters of Amaryllis We, however, have adhered to the old, and, as we think, most intelligible, mode of understanding the genus This is a fine stately genus of the Amaryllideæ: several beautiful species have lately been introduced They grow best in rich loam, mixed with a little rotten dung, and potted in large pots they will flower abundantly They may be increased by suckers from the root, or by seed If the plant be shy in producing suckers, it may be cut down near to the root, and it will send out plenty (*Bot Cult* 46)

4170 Leaves linear ensiform rounded obtuse flat, Scape compressed, Stamens longer than cor
4171 Leaves linear obliquely bent, Petals flat
4172 Leaves linear flat, Germen with three glands
4173 Leaves linear ensiform rounded obtuse flat, Scape rounded, Stamens as long as cor.
4174 Leaves filiform, Petals acute
4175 Leaves filiform spiral, Petals acute colored outside
4176 Leaf filiform straight, Umb many-flowered, Petals wavy flat
4177 Sepals spreading alternately bearded beneath the ends
4178 Scape flexuose much longer than the lanceol. ciliated leaves, Pedunc. very long, Petals wavy channelled

4179 Leaves striated, Umbel sessile many-flowered, Tube furrowed about as long as limb
4180 Lvs lanc lor with cartil teeth, Umb subs many-fl Tube longer than limb, Stam little long than style
4181 Ends of sepals hooked inwards, Leaves linear channelled, Scape 4-fl
4182 Bulb with a very long tap-root, Leaves stiff erect with long points smooth at edge, Umb sess many-fl
4183 Bulb spherical, Leaves narrow with a nearly smooth edge, Umb few-fl sess Sep lin lanc as long as tube
4184 Bulb oval not with a neck, Lvs broad lin lanc straight with a white cartil toothed edge, Umb of fl sess.
4185 Bulb round, Leaves narrowed lax channelled hispid at edge, Umb sess many-fl Seg shorter than tube
4186 Bulb ovate with a neck, Leaves broad subulate roughish at edge, Spathe herbaceous
4187 Bulb cylind above ground, Lvs lanc smooth at edge longer than scape, Umb stalk Sep long lin reflexed

4188 Bulb very large with long red neck, Lvs broad glauc smth at edge, Umb many-fl Tube shorter than limb
4189 Bulb with long neck, Lvs obl lanc with obt point smooth wavy at edge, Umb many-fl with pale bractes
4190 Bulb cylindrical scarcely with a neck, Leaves lorate with a smooth edge, Umb on a very long stalk
4191 Bulb cylindrical like a leek, Scape central broad compressed, Umb many-fl. lax stalked
4192 Bulb ovate, Leaves scattered straight of one form
4193 Bulb cylindrical ovate, Leaves lorate very long, Umb many-fl stalked
4194 Bulb colum above ground, Lvs many lanc with smooth edge, Scape as long as lvs Umb stalk 20-30-fl
4195 Bulb columnar, Leaves many bluntly acuminate, Flowers sessile, Segments longer than tube
4196 Lake C asiaticum, but with leaves strong plaited backwards about their middle
4197 Bulb oblong, Leaves acute wavy smooth at edge, Flowers many stalked declinate
4198 Bulb oblong ovate red, Leaves rough at edge, Flowers spreading, Sepals lanceolate flat not revolute
4199 Bulb round, Lvs wavy rough at edge, Sepals obov flat, Flowers very large with a tinge of pink at back
4200 Bulb ovate, Leaves narrow channelled acute, Flowers upright crowded
4201 Bulb ovate, Leaves very long narrow green twisted, Flowers campanulate, Stamens spreading
4202 Bulb ovate, Leaves a little rough at edge, Umbel 5-flowered shortly stalked, Sepals lanc flat
4203 Leaves long narrow weak, Scape shorter than leaves, Umbel 5-6-flowered
4204 Leaves long narrow recurved rough at edge, Scape 2-edged, Umb 5-flowered, Sepals broad

4205 Leaves linear channelled, Flowers cernuous, Tube cylindrical
4206 Leaves 3 linear glaucous, Pedunc somewhat shorter than flower, Stamens included
4207 Many-flowered, Leaves 3 ligulate spiral obtuse glaucous
4208 Leaves lanceolate obtuse flat oblique, Cor pendulous obversely conical
4209 Leaf solitary linear glaucous, Limb as long as throat
4210 Flowers about 4 straightish nodding, Anthers included, Leaves linear not glaucous
4211 Leaves linear lanc keeled appearing after the flowers, Cor nodding, Limb as long as tube

4212 Lvs strap-shaped erect spreading glaucous, Scape twice as long as the rays of the many-flowered umbel

4213 Leaves linguiform lying on the ground smooth
4214 Leaves lingulate pressed on the ground with a cartilaginous edge
4215 Leaves elliptical pressed on the ground rough with little pustules
4216 Leaves elliptical ovate erect edged
4217 Leaves falcate with a muricated discolored cartilaginous edge
4218 Umbel hemispherical close, Leaves many erect oblique glaucous

4219 Leaves strongly fringed with white hairs

and Miscellaneous Particulars

736 *Cyrthanthus* From κυρτος, curved, and ανθος, a flower The tube of the flower is long and round. This is an elegant genus, and the species grow well in sandy loam mixed with a little peat They require plenty of water when in a growing state, but scarcely any when dormant, and they should be fresh potted just before they begin to grow, when they will flower freely They may be increased by offsets from the bulbs, or from seeds (*Bot Cult* 176)

737 *Brunsvigia* Named after the noble family of Brunswick This is a splendid genus, some of the bulbs grow to a great size, and require large pots to have them thrive and flower in perfection They require plenty of water when in a growing state, but must when dormant be kept so by wholly withholding water.

History, Use, Propagation, Culture,

738 *Nerine* A fanciful name *Nerine* was the daughter of Nereus The plant has become naturalised in Guernsey, having been part of the cargo of a Cape ship, which was cast away many years ago on the coast of the island N sarniensis is a popular autumnal bulb, imported annually from the islands of Jersey and Guernsey, where it is grown in the open air in a sandy soil Here it requires the protection of a frame to perfect the bulbs, so as it may flower the following year The reason is, that the leaves on which the perfection and future flowering of every bulb depends, are protruded in the beginning of winter, and our winters are too long, gloomy, and severe, to admit of these leaves performing their functions properly. Hence two or more winters in a very mild situation in the open air are required to do what in Jersey is done in one winter, or two winters (as W Williamson experienced) in a cold frame, or one winter only (agreeably to Knight's experience) in a frame with artificial heat (*Hort Trans* iii. 450 iv. 177, and *Calcd. Mem* ii 62)

4220 Leaves narrow sub-involute glaucous falcate, Petals lin -lanc wavy, Stamens erect sub-exserted
4221 A mere variety of the foregoing, from which it differs in having crimson flowers
4222 Many-fl Leaves many narrow sub-involute not glaucous upright
4223 Like the last, but the flowers are scarlet and appear at the same time as leaves
4224 Lvs. very narrow obt min pustulate, Sepals recurved divaricating the one bearing the stamens remote
4225 Leaves few ligulate channelled, Sepals turned upwards oblique, Stam declinate shorter than cor
4226 Laxly many-fl Lvs few lin Cor recurved stel irregular, Sepals curled, the lowest placed under the stam
4227 Fl. stalked erect, Cor infundibulif clavate, Sepals linear lanceolate, Stamens straight, Leaves quite blue
4228 Five sepals, or all rising in a semicircular ray wavy, Stam deflexed twice as long as cor
4229 Leaves broad nerved lying on the ground, Sepals equally revolute, Stamens very long
4230 Leaves linear lorate, Scape flat smooth, Peduncles upright hispid 3-cornered twice as long as flower
4231 Leaves glaucous, Cor deformed pale streaked with red

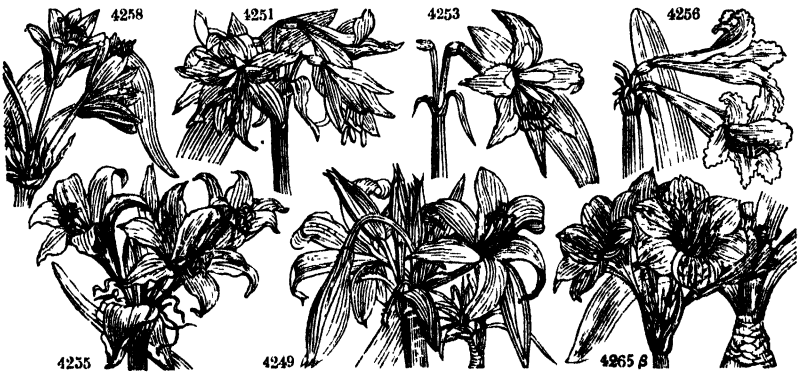
4232 Flower sessile, Leaf one linear, Sepals longer than tube ovate obl reflexed acute, Stamens inclined
4233 One-flowered, Cor. regular erect turbinate conniving, One sepal pushed aside by the stamens
4234 Tube fringed, Cor nodding with a very ringent limb, Stam. included in the involute lower segments
4235 Tube crowned by a short entire green membrane
4236 Two-flowered half ringent, Membrane of the tube very short two-colored toothletted, Stamens included
4237 Mem of orifice entire, Limb half ringent nodding with outer seg incurved at end, the inner recurved
4238 Tube fringed, 2-3-fl Stalks shorter than the erect spatha, Tube horizontal, Limb curved upwards

4239 Tube fringed, 2-4-fl Lvs few lorate acum. with a keeled rib, Cor cernu deeply turbin Tube short thick
4240 Many-fl Tube fringed, Leaves 1 or more linear ligulate involute glaucous, Stalks as long as nodding cor

4241 Flowers about 2 with a very long tube and a nearly regular limb
4242 Leaves long strap-shaped with the scape very cœsious, Flowers 4 ringent with taper pointed segments

4243 Cor funnel-shaped campanulate drooping, Stamens straight exserted, Leaves green lorate obtuse
4244 Umbel 6-fl Sepals rolled into a cylindrical tube, Flower-stalks the length of flowers, Stigma simple
4245 Flower solitary erect, Sepals conniving, Stamens ascending, Anthers innate, Leaves linear fleshy
4246 Flower nodding ringent, Outer sepals broadest, Throat naked, Tube the length of the ovary
4247 Leaves several lorate-oblong narrow, towards the base, Flower cernuous cucull. tubular obliquely ringent

4248 Leaves linear very long and weak, Limb nodding 2-lipped, Flower-stalks many times longer than ovary
4249 Lvs numerous spreading flat with rough edge, Fl about 10 with nodd spreading obsoletely 2-lipped limb



4250 Bulb spherical, Spathe bifid erect obtuse, Flowers sessile, Leaves with a long point wavy downwards
4251 Spathe withered scarcely as long as stalks, Cor cern uneq Tube as long as germen, Upper sepal remote
4252 About 2-fl Spathe arid refl Limb turbin bilabiate three upper sep conniv recurv lower narr remote
4253 Leaves obl lanc not glaucous, Flowers nodding with an oblique mouth, the upper one much reflexed
4254 Lvs many obl obtuse, Pedunc divaricating as long as fl Tube short turbin Limb recurved spreading
4255 With many fl on stalks, Lvs ligul Cor regular turbin. nodd Sepals recurv at end, Tube scarcely any

4256 Cor cucul campanulate, Outer sepals separate to the bottom, inner united half way by the interior ribs

4257 Lvs altern turn both ways fal Scape flat, Cor regul Tube twice as short as revol limb Stam erect spread
4258 Umb many-fl shortly stalked, Leaves attenuated glaucous, Tube about twice as long as limb

4259 Many-fl Leaves acuminate glaucous, Flowers erect recurved stalked cucullate, Limb spreading revolute
4260 Leaves many lorate lanceolate wavy thick in the middle, Limb cernuous as long as tube
4261 Lvs many lorate atten channelled rough at edge, Limb obsoletely 2-lipped shorter than tube nodding
4262 Leaves obl lanceolate narrowed both ways wavy rough at edge, Limb nodding shorter than tube
4263 Spathe many-fl Flowers stalked tubular at base, Leaves obl lanceolate
4264 Spathe 2-fl Cor. campan deeply 6-parted, Upper seg very narr, lower ob acum. Lvs lin. longer than scape

4265 The only species, *Amaryllis purpurea* of Willd

and Miscellaneous Particulars.

739 *Amaryllis* Name of a nymph celebrated by the poets, and especially by Virgil. Derived from αμαρυσσω, to be resplendent This is a superb genus. the greenhouse sorts thrive best in a rich loamy soil, and should have but little water given them after they have done flowering, so that the bulbs may harden, to produce more flowers the following season. Most of them are increased freely by offsets, and ripen plenty of seed A shell taken from the bulb, with a leaf on it, and planted in a pot of mould, will produce a bulb, as will almost any bulbous-rooted plant. (*Bot Cult* 131)

The *stove Amaryllises* grow best in light loam and rich soil, and the strong growing kinds require large pots to flower in perfection, they are increased by offsets and by seeds, which they bear plentifully, if care be taken to shake some pollen on the stigma at the proper period.

740. *Vallota* A name of unknown meaning. The only species of this genus is a beautiful Cape plant, with bright purple flowers, of which two varieties are known in gardens

History, Use, Propagation, Culture,

741 *Griffinia* Named by Mr Ker, after William Griffin, Esq of South Lambeth, an amiable man, and most assiduous and successful collector of bulbous plants His collection is even now one of the finest in Europe. These species resemble Amaryllis, but have broad-stalked leaves, and blue flowers.

742 *Sternbergia* Named after Count Caspar Sternberg, a celebrated botanist and patron of botany. The species consist of the hardy plants formerly referred to Amaryllis, they are all hardy, and, with the exception of S lutea, very rare

743 *Zephyranthes* A fanciful name employed by Mr Herbert It seems to mean wind-flower These are pretty plants, with solitary white or pink flowers The species are so nearly hardy, as to survive in a warm border all but our severest winters

744 *Habranthus* From ἁβρος, delicate, and ανθος, a flower Small Chilian plants resembling the last in habit, and principally distinguished by their very unequal declinate stamens

745 *Doryanthes* So called by Correa de Serra, from δορυ, spear, and ανθος, a flower, on account of the long straight stem, surmounted by a head of crimson flowers. This is a fine plant from New South Wales. It grows freely in a mixture of sandy loam and peat, but does not flower till it gets large · a conservatory is the most proper place for it, as the flower-stem grows to a great height before the flowers expand It may be increased by suckers from the roots, but these are sparingly produced (*Bot Cult* 181)

746. *Gethyllis* From γηθω, to rejoice The flowers are much valued at the Cape of Good Hope for the delicious perfume of their flowers The species are very curious · but few have been introduced Their bulbs require the usual attention as to not watering them when in a dormant state; they are increased by offsets or seeds.

4266 Leaves with a flat stalk, The three lower sepals wavy, Scape with a prominent line along each side
4267 Leaves oval-lanceol. with a stalk two-edged crosswise, Umbel remarkably stalked, Sepals uniform

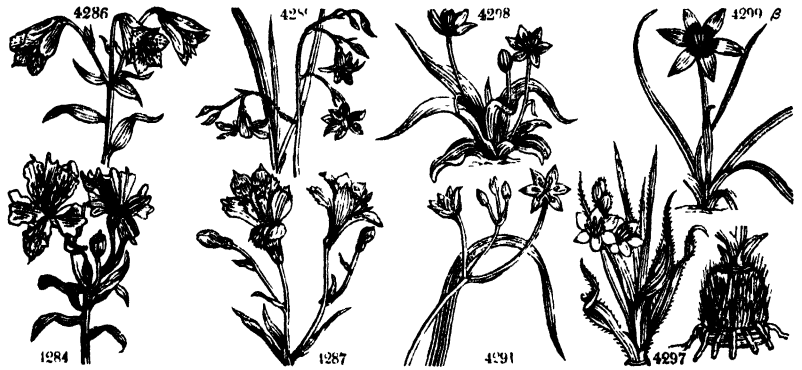
4268 Leaves linear obliquely twisted shining
4269 Leaves lorate flat very glaucous laxly spiral
4270 Leaves many-keeled, Flower sessile on a two-edged scape, Sepals oval-oblong obtuse
4271 About 2-flowered, Leaf linear, Tube very short, Sepals rounded at end

4272 Leaves few linear, Spathe 1-leaved sheathing erect bifid twice as short as stalk
4273 Leaves many ligulate, Spathe bifid longer than stalk, Sepals acuminate
4274 Leaves lying flat on the ground shorter than the one-flowered scape, Spathe bifid fleshy at end

4275 Leaves linear
4276 Leaves cylindrical

4277 The only species

4278 Leaves linear spiral smooth, Sepals ovate oblong
4279 Leaves linear spiral ciliated, Sepals ovate oblong
4280 Leaves linear filiform spiral villous, Sepals ovate oblong
4281 Leaves lanceolate flat, Sepals lanceolate



4282 Leaves linear lanceolate, Sepals oblong

4283 Leaves linear, Scape racemose, Sepals linear

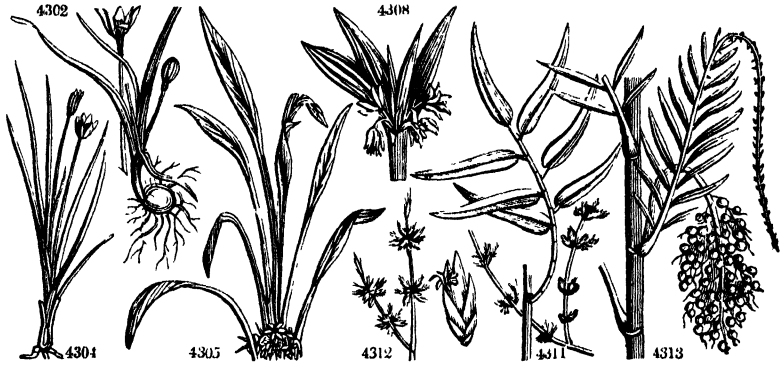
4284 Stem erect, Cor spreading, Three outer sepals wedge-shaped 3-toothed, Leaves lin lanc sessile
4285 Stem erect, Leaves spatulate oblong, Pedunc longer than involucr Cor 2-labiate
4286 Stem twining, Cor cylindrical in branched umbels
4287 Stem erect, Leaves linear lanceolate, Flower-stalks twisted, Outer sepals obcordate mucronate
4288 Stem weak, Leaves spatulate ciliated, Umbel many-flowered, Peduncles 2-flowered

4289 Flower campanulate spreading

4290 Hairy, Scape 4-fl shorter than lin lanc leaves, Pedunc twice as short as leaves
4291 Like the last, but the leaves are shorter more villous and incurved, Petals more obtuse
4292 Villous, Scape 4-fl shorter than lin lanc lvs Pedunc shorter than flower, Fruit cylindrical
4293 Pilose, Scape 2-fl decumbent shorter than lin lanc leaves
4294 Scape 3-fl pilose as long as leaves, Pedunc thrice as long as fl Leaves lanc smooth obliquely bent
4295 Leaves linear, Scapes umbelliferous or 1-fl Height depending on depth of water
4296 Scape 1-flowered shorter than filiform rounded smooth leaves
4297 Leaves at the edge and keel hairy, Scape hispid many-flowered racemose, Sepals obtuse
4298 Leaves ovate-lanceolate entire smooth, Scapes 1-flowered
4299 Scape 1-flowered shorter than the lin lanc loose keeled smooth leaves

and Miscellaneous Particulars

747 *Polianthes* From πολυς, many, and ανθος, a flower, in allusion to the abundance of the blossoms. This is a very popular bulb, on account of its highly odoriferous flowers. It is imported annually from Italy and America, and flowers freely in pots of sandy loam and some rotten dung or leaf mould R. A Salisbury is of opinion that we might grow our own bulbs, by planting the offsets in such a situation as would obtain for them a "sufficient degree of heat in summer to bring their leaves out to their full magnitude, that of the roots following of course." "The theory," he adds, "which I would recommend any intelligent gardener to adopt in its general management is, to keep the roots growing as vigorously as possible from May to October, but in a state of complete rest and drought for the rest of the year" (*Hort. Trans* i. 53.)



748 *Alstræmeria.* So named from Baron Claudius Alstræmer, of Sweden, who in his travels through Europe sent many plants to Linnæus The species are beautiful, and A Ligtu is as fragrant as mignionette. A Salsilla is cultivated in Peru and the West Indies for its roots, which are used like the tubers of the potatoe

A. Ligtu, Sweet observes, "is generally considered difficult to flower, but it will blossom well by letting the pots be dry for a considerable time till the shoots are all dried up, then give it a good watering, and put it in a moist heat, and it will flower abundantly. It may be increased by parting the roots or by seed." (*Bot Cult.* 15) The finest kinds have not yet been introduced to this country.

749. *Conanthera.* From κονος, a cone, and ανθηρα, an anther, their anthers being, which is singular among these plants, united into a cone. A pretty little Peruvian genus, of which two species are now known

750. *Hypoxis.* From ὑπο, beneath, and οξυς, pointed, in allusion to the sharp points of the inferior sepals. The species are plants with yellow flowers of little beauty, if we except H. stellata, which has a dark spot at the claws of its white petals. They increase fast by seeds or offsets.

History, Use, Propagation, Culture.

751 *Curculigo* From *Curculio*, the weevil, one of the Coleopterous insects, the seed having a process resembling the rostrum or beak of that animal The species are of the easiest culture and increase, but of little beauty They in most respects resemble Hypoxis

752 *Bambusa* Latinized from the Indian name *Bambos* B arundinacea has a woody, hollow, round, straight culm, forty feet high and upwards, simple and shining, the internodes a foot in length and circumference, sheaths thick, hairy, rough, convolute, deciduous, branches alternate, slender, solid, spiny, reclining, springing out from the base to the very top, the lower ones being usually cut off Panicle of flowers diffused in spikes

It grows naturally almost every where within the tropical regions Over a great part of Asia it is very common, in China, Cochin-China, Tonquin, Cambodia, Japan, Ceylon, the peninsula of India, and the islands It has been long introduced into the West Indies, and is said to flourish likewise in South Carolina

There is, perhaps, scarcely any plant that serves for such a variety of domestic purposes In the East Indies great use is made of it in building, and the houses of the meaner people are almost entirely composed of it. Dr Patrick Brown mentions, that it was yet strong and perfect in some of the houses which had been built by the Spaniards in Jamaica above a hundred years before Bridges also are made of it, masts for their boats, boxes, cups, baskets, mats, and a great variety of other utensils and furniture, both domestic and rural Paper also is made from it, by bruising and steeping it in water, and thus forming it into a paste It is the common fence for gardens and fields, and is frequently used as pipes for conveying water The leaves are generally put round the chests of tea which are sent to Europe from China, as package, fastened together so as to form a kind of mat The tops of the tender shoots are frequently pickled in the West Indies.

In the cavities or tubular parts of the bamboo is found at certain seasons a concrete white substance, called Tabasheer or Tabachir, an article which the Arabian physicians hold in high estimation It is commonly found in what are called the female or large bamboos The bamboos which contain this concrete are found on shaking to contain a fluid, which, after some time, gradually lessens, and then they are opened in order to extract the Tabasheer The nature of this substance is very different from what might have been expected in the product of a vegetable Its indestructibility by fire, its total resistance to acid, its uniting by fusion with alkalies in certain proportions into a white opaque mass, into a transparent permanent glass, and it being again separable from these compounds entirely unchanged by acids, &c seem to afford the strongest reasons for considering it as very nearly identical with common siliceous earth. As to its medical virtues, though the drug be, as before observed, in much esteem with the orientalists, yet they are not such as to cause it to have any regard paid it in the modern practice of physic in Europe

The bamboos grow rapidly to a great height in our stoves in moist loamy soil, and they are readily increased by suckers

753. *Calamus.* From *καλαμος*, a reed, in Greek, *qalem*, in Arabic, *calam*, in Sclavonic; *calamus*, and *culmus*, in Latin This genus seems to form the connecting link between the palms and the gramineous plants, having the inflorescence of the former, and the habit of the latter It furnishes the rattan canes, of which

4300 Leaves radical numerous white beneath with stellate hairs, Umbel few-flowered
4301 Scape 1-fl shorter than the oblong elliptical smooth plaited leaves
4302 Leaves linear smooth channelled, Flower solitary green outside
4303 Scape 1-fl shorter than the linear ciliate serrate keeled leaves, Flowers out of flower reflexed
4304 Leaves channelled hairy entire, Scapes 1-fl.

4305 Leaves lanceolate on long stalks, Head sessile, Flowers shorter than bractes
4306 Leaves linear subulate, Flowers sessile
4307 Leaves linear subulate, Flowers stalked
4308 Leaves lanceolate, Tube of flower very long
4309 Leaves elliptical, Head sessile, Tube of flower scarcely longer than limb
4310 Leaves elliptical recurved, Head stalked cernuous, Tube of flower very short

4311 Panicle branched divaricating
4312 Spike terminal simple whorled

4313 Prickles of stem reflexed, Spadix divaricating straight
4314 Prickles spreading, Spadix radical

4315 Culm divided, Panicle branched, Flowers erect digynous

4316 Point of scape very long leafy
4317 Point of scape scarcely longer than spadix

4318 Leaves lanceolate-ovate
4319 Leaves ensiform

4320 The only species

4321 Leaves tripartite multifid
4322 Leaves ovate lanceolate entire stalked

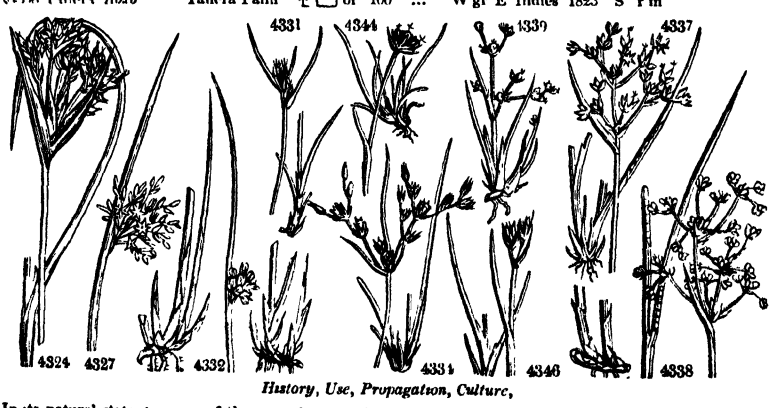
and Miscellaneous Particulars

there are several species or varieties, all distinguished by a stem which is perennial, unbranched, long, round, solid, jointed, scandent when near trees, but without prickles or tendrils, extremely tough and pliable The different sorts grow on the banks of rivers in the East, like our reeds, and furnish valuable props for plants, cables, ropes, withs, wicker and wattled work, baskets, hoops for petticoats, walking-sticks, &c

C Zalacca, the Salzick, is cultivated for the fruit, which is about the size of a walnut, and covered with scales like those of a lizard, within the scales are two or three sweet yellow kernels. This tree is supposed to yield the dragon's blood

754. *Ehrharta* So named by Linnæus, in honor of Frederick Ehrhart, a native of Switzerland, a very diligent and acute observer These are very curious grasses, of which an account has been published in the Transactions of the Linnean Society

755 *Acorus*. From *α*, privative, and *κορη*, the pupil of the eye, maladies in which are supposed to be cured by the virtues of this plant. Acorus Calamus, Linnæus observes, is the only native aromatic plant of northern climates, the root powdered might supply the place of foreign spices. It has a strong aromatic smell, and a warm, pungent, bitterish taste The flavor is greatly improved by drying The roots are commonly imported from the Levant, but those of our own growth are full as good. The Turks candy them, and regard them as a preservative against contagion In many counties of England, in which the plant abounds, it was formerly used to strew the floors of houses instead of rushes, a purpose for which its fragrant leaves made it very suitable.



The aromatic principle is an essential oil, which can be obtained by distillation The root has been employed in medicine since the time of Hippocrates. By the moderns it is successfully used in intermittent fever even after bark has failed, and is certainly a very useful addition to Cinchona. It is also a useful adjunct to bitters, and stomachic infusions. Thomson says, (*Mat. Med.* 134.) it is too seldom prescribed. Though the plant is abundant in the fenny districts of England, yet what is used by the druggists is imported from the Levant. No cattle whatever eat the plant.

756 *Orontium*. The Greek name of a plant now unknown to us as such It is thought to have been so called from growing on the edge of the Orontes, a river of Asia Minor. O. japonicum has broad leaves like those of the lily of the valley, green on the upper side, and covered with very minute hairs, so that they look like a fine velvet. Cattle, hogs, and stags, are very fond of these leaves in the spring, and they come out among the earliest. Kalm states, that the Indians gather the seeds and eat them when dried like peas, boiling them repeatedly in water before they are fit for use, they also boil them in milk or butter, and use them instead of bread They call the plant *Tawkee*. It grows in marshes, near moist and low grounds, very plentifully in Virginia, Canada, and other provinces of North America.

757. *Tupistra* A diminutive of *τυπτω*, a mallet, on account of the peculiar form of the flower. An obscure plant, supposed to belong to the order Aroideæ It has long lanceolate broad leaves, and radical spikes of dingy purple flowers. It requires the heat of a bark-bed.

758. *Taccа*. The Malay name of the plant. T. pinnatifida has a red root, the size of a man's fist, roundish.

History, Use, Propagation, Culture,

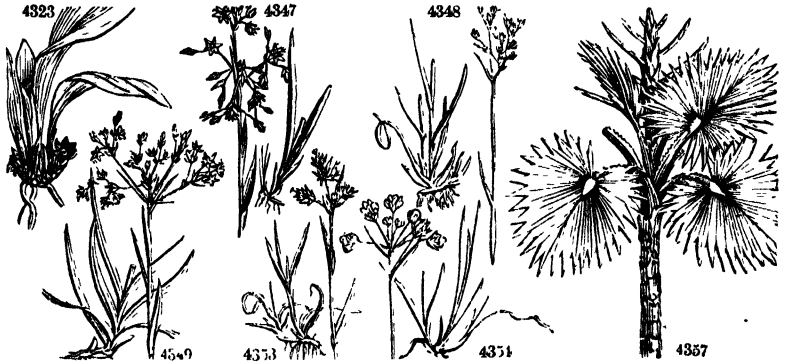
In its natural state it is one of the most bitter and acrid, but loses something of these qualities by culture. The raw root is rasped, and washed frequently in water, when a white meal falls to the bottom like starch, this is again washed twice or thrice, till no more acrimony can be perceived in the water. The meal is then dried in the sun The first infusions are thrown away carefully, being looked upon as noxious and even deadly. In Otaheite and the other Society isles, they make of this meal a tasteful, nourishing, gelatinous cake-like salep In Banda, where sago bread is not common, they use this as a succedaneum, and it is even preferable to the other They also apply it as a plaster to deep wounds The petioles and stalk boiled a long time lose their acrimony, and are rendered fit for food, as well as the roots, in China and Cochin-China.

759. *Aspidistra* From ασπις, a little round shield, on account of the form of the flower A plant with the same habit as Tupistra, but with solitary radical flowers half buried in the earth

760 *Juncus* From the Latin, *jungo*, to join . the first ropes were made of rushes The Junceæ and Cyperaceæ form intermediate links between the Gramineæ and the Liliaceæ, some of the latter, as Anthericum, bearing considerable resemblance to the Junceæ

J acutus and maritimus are planted on the sea-embankments of Holland, and also in some parts of our own coasts, and in America. The roots run deep into the sand, and form a matted body which holds it together In Holland, when the plants are fully grown and in flower, they are cut down down, dried, and bound up like corn The J. acutus, being very rough, is used for scouring copper and other vessels, and is one of the plants imported into this country for that purpose, under the name of the Dutch rush. The other species, and often both, are plaited into mats, baskets, chair-bottoms, ropes, &c.

J. conglomeratus and effusus are used when green for making little baskets and children's ornaments, and the pith of this and other species is used as wicks for watch-lights, and children's toys.



J. glaucus and conglomeratus are bad weeds in wet-bottomed clayey pastures The best way of removing them is to dig them out, and to prevent their growth, to lay the land dry by surface and under-drainage These species, and some others, are gathered green by the Dutch gardeners, and used when dry as tyes for fruit-trees. Sir J E. Smith says, " they both, probably, served for strewing floors in England, as mentioned by Shakspeare and Sir Thomas More, about the time of Edward IV , and later , till more refined manners wrought

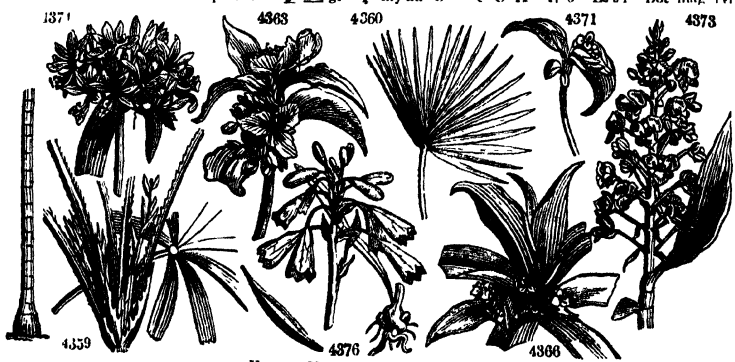
4323 The only species

4324 Culm rounded mucronate, Panicle terminal, Invol 2-leaved spiny
4325 Panicle terminal proliferous, Involucre 2-leaved spiny, Caps. obl acute as long as sepals
4326 Culm upright, Pan. lateral globose, Caps retuse, Flowers triandrous
4327 Culm upright, Pan lateral decompound effuse, Caps clavate truncate at end
4328 Culm glaucous at the end bent inwards and rounded, Pan. lat. erect, Caps. oblong acute
4329 Culm pungent, Panicle effuse
4330 Culm erect, Umbel lateral, Pedunc many-fl. Flowers sessile
4331 Culm filiform nodding, Panicle lateral
4332 Leaves and flowers ternary terminal
4333 Leaves setaceous, Heads clustered leafless
4334 Leaves linear flat, Stem dichotomous racemose higher than leaves, Flowers solitary
4335 Culm filiform, Head terminal sessile solitary in an involucre
4336 Leaves jointed compressed, Culm not jointed, Panic erect, Caps colored shining
4337 Leaves jointed compressed, Culm not jointed, Panic compound dichotomous, Sepals acute
4338 Leaves and stem jointed round, Panic divaricating, Sepal obtuse as long as capsule
4339 Leaves bristly somewhat knotty, Heads 3-flowered proliferous, Culm bulbous rooting
4340 Bulbous, Culm leafy erect compressed, Flowers 3-androus and bracteæ bearded
4341 Culm procumbent, Leaves setaceous jointed, Corymb dichotomous divaricating, Head 5-fl sessile
4342 Leaves linear channelled, Culm leafy at base, Pan cymose, Caps. obtuse
4343 Leaves linear channelled, Culm dichotomous racemose, Flowers solitary
4344 Leaves flat, Head 3-flowered terminal erect leafless with bracteæ
4345 Leaves flat, Head 2-flowered terminal one-sided leafy at base
4346 Leaves flat stem-clasping, Head terminal double many-flowered leafy at base, Bractes acute

4347 Leaves pilose, Panic cymose divaricating, Flowers solitary, Caps obtuse
4348 Leaves pilose, Panic cymose erect, Flowers solitary, Caps pointed
4349 Leaves pilose taper-pointed, Panic cymose decompound, Flowers in bundles
4350 Leaves and sheaths smooth, Corymb comp close, Pedunc many-flowered, Sepals acute shining
4351 Leaves pilose, Corymb decomp spreading shorter than leaves, Sepals mucronate equal, Root fibrous
4352 Leaves pilose, Corymb comp contracted shorter than leaves, Sepals acute unequal, Root creeping
4353 Leaves pilose, Spikes terminal, Capsules obtuse
4354 Like the last, but the culm is panicled with ovate spikes
4355 Leaves flat, Spike racemose nodding compound at base, Capsules acute
4356 Like Luzula pilosa, but heads are yellower, Leaves broader, Flowers and capsules larger

4357 Fronds pinnate palmate with a thread between the segments, Spadix erect
4358 Seeds roundish dark-colored rugose the size of a nutmeg

and Miscellaneous Particulars



them into mats, and foreign commerce at length introduced carpets For the former purpose, indeed, as well as for chair-bottoms and hassocks, Scirpus lacustris has superseded their use. (*English Flora*, p. 162.)

761. *Luzula* These plants were called by the ancient botanists *Gramen Luzulæ*, whence this name has been contrived by Decandolle to distinguish the rushes with flat leaves, from those which have leaves resembling the stem.

762. *Corypha.* From κορυφη, the summit of any thing, a name applied by Linnæus to this noble genus of palms, the topmost leaves of which form immense fans twenty feet long and fifteen wide In Ceylon this palm is called Tallipot, and, according to Knox (*Hist of Ceylon.*), it grows as big and tall as a ship's mast, and very straight The leaves are of great use, one being so broad and large, that it will cover fifteen or twenty men Being dried it is very strong and limber, and though it be very broad when open, yet it will fold close like a fan, and then is no bigger than a man's arm The whole leaf spread is round, but is cut into triangular pieces for use these they lay upon their heads as they travel, with the narrow end foremost, to make their way through thickets Soldiers all carry them, not only to shade them from the sun, and to keep them dry in case of rain on their march, but to make their tents for them to lie under These leaves all grow on the top of the tree It bears no fruit until the last year of its life, and then yellow blossoms, most lovely to behold, but smelling very strongly, come out on the top, and spread abroad in great branches, these come to a fruit, round and very hard, as big as our largest cherries, in such abundance, that one tree will yield seed enough for a country, but not good to eat The flowers smell so strong, that they cut down the trees when they are near houses. The trunk within is a pith only, which they beat in a mortar to flour, and bake cakes of it, which taste much like white bread. The leaves also serve for covering their houses, and for writing on with an iron style Most of the books which are shown in Europe for the Egyptian papyrus, are made from the leaves of this palm In Malabar it is called Codda-pana. Rumphius, Loureiro, and Adanson mention several other species of this palm

The C taliera is a fine tree of prodigious use in the northern provinces of India for covering houses and for other useful purposes.

History, Use, Propagation, Culture,

763 *Licuala* The Macassar name of this plant in the Moluccas The fruit of this palm is a fleshy oval drupe, about the size of sweet-bay berries, it continues long green, but finally becomes brown or blackish the nut is oblong, hard, and striated. In the Isle of Celebes, and in Macassar, they make much use of the narrow leaves for tobacco pipes, and of the middle broad one for wrapping up fruit, &c. The wood, if the pith and hard rind may be so called, like that of most palms, is of little use.

764 *Thrinax* From θρινάξ, a fan The leaves of this little palm form a sort of fan Brown (*Hist of Jamaica*) says, that this tree covers whole fields in many parts of Jamaica; that it grows both in the rocky hills and low moist plains near the sea, but seems to thrive best in the former It shoots by a simple stalk, and rises generally from four or five, to ten or fourteen feet in height It is always furnished with leaves in form of a fan, sustained by slender compressed foot-stalks, and bears a great abundance of small berries, which serve to feed both the birds and beasts of the wood, when they are in season The trunk seldom exceeds four or five inches in diameter it is much used for piles in wharfs, and other buildings made in the sea; for it stands the water well, and is never touched by the worms. The foot-stalks of the leaves split and pared, serve to make baskets, bow-strings, ropes, &c where strength and toughness are required The leaves are called thatch, and are used as such, especially for out-houses, and stand the weather many years, but such coverings are apt to harbour rats and other vermin

765. *Tradescantia.* So named by Ruppius, in memory of John Tradescant, gardener to Charles I. He introduced the first species to Europe The museum of the Tradescants is celebrated as one of the earliest ever

4359 Frond palmate, Segments linear toothed truncate at end, Stem spiny

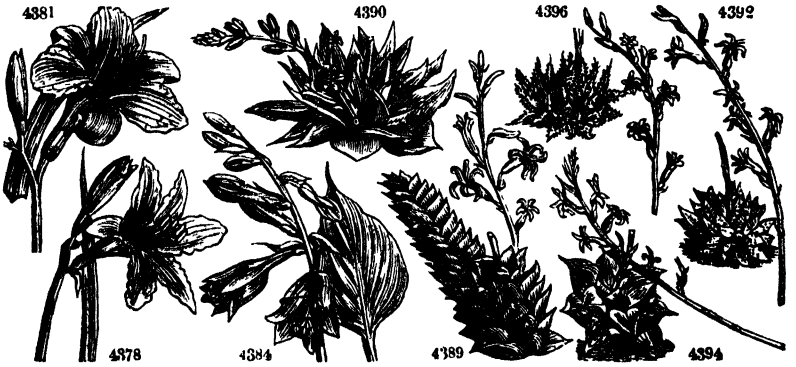
4360 Fronds flabelliform palmate plaited with stiff lanceolate segments, Stem compressed not prickly

4361 Erect, Leaves lanceolate smooth, Flowers umbelled clustered terminal
4362 Erect, Leaves grassy very long, Peduncles few-flowered, Cal smooth
4363 Erect smooth branched, Leaves long recurved ciliated, Pedunc. lat and term
4364 Leaves ovate at the edge and under woolly, Flowers umbelled clustered terminal
4365 Erect, Leaves ovate narrow at base smooth, Peduncle terminal naked bifid racemose
4366 Stemless smooth, Bractes equitant compressed, Leaves lanceolate colored beneath
4367 Erect smooth, Peduncles solitary very long
4368 Stemless with rusty hairs, Leaves elliptical acuminate radical
4369 Creeping, Leaves ovate oblong. under the flowers cordate, Pedunc. umbelled axillary
4370 Procumbent hairy
4371 Creeping smooth, Spathes 2-leaved imbricated
4372 Erect, Leaves broad lanceolate, Pedunc. lateral solitary many-flowered, Bractes double

4373 Leaves oval lanceolate whole-colored, Racemes thyrsoid many-flowered

4374 Peduncles length of corolla, Leaves linear

4375 Peduncles twice as long as corolla, Leaves linear



4376 Bractes twice as short as flower-stalks, Leaves very narrow
4377 Bractes as long as flower-stalks: the inner much the shortest

4378 Leaves linear keeled, Three inter petals wavy, Nerves of the petals undivided
4379 Leaves linear keeled, Petals flat acute, Nerves of the petals undivided
4380 Leaves linear keeled distichous, Sepals wavy acute spreading reflexed, Nerves branched
4381 Leaves linear keeled, Three inner petals obtuse wavy, Nerves of outer petals branched
4382 Leaves linear flat, Scape simple, Nerves of petals undivided

4383 Leaves cordate acuminate, Cor funnel-shaped
4384 Leaves ovate acuminate, Limb of cor campanulate

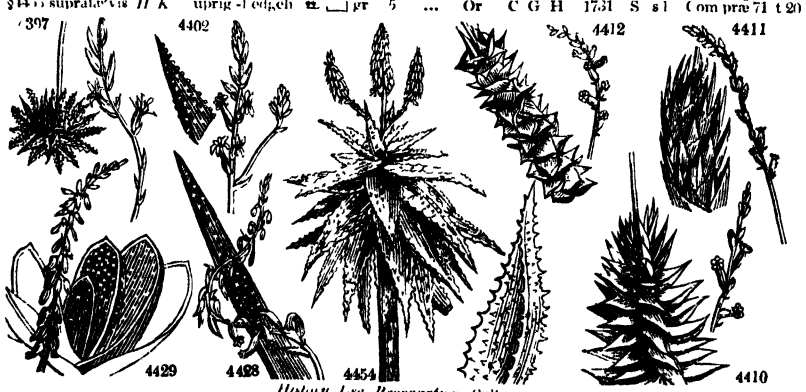
§ 1 *Flowers small Cor bilabiate* (APICRA *W*)

4385 Leaves spreading ovate 3 cornered, Edge and keel with short subulate teeth
4386 Leaves spirally trifarious spreading blackish, on the outside smooth, Stem much twisted
4387 Nearly stemless, Leaves multifarious green not spotted the upper horizontal rugose
4388 Leaves trifarious orbicular ovate acuminate green beneath very rough, Stem erect
4389 Leaves trifarious ovate acute very green not warted, Stems upright simple
4390 Leaves polished mucronate whitish, Edges and keel cartilaginous
4391 Leaves cymbiform obtuse glaucous very hollow above, Suckers numerous
4392 Leaves equilaterally triquetrous obtuse glaucous netted above concave
4393 Leaves subulate thick erect recurved concave above warted beneath, Edges obscurely pearly
4394 Leaves 6-farious at the end retuse deltoid pale-green lined above
4395 Leaves ciliate spiny 5-farious deltoid cuspidate at the edge and keel ciliate spiny, Obsoletely netted below
4396 Proliferous, Leaves multifarious lanceolate rounded elegantly ciliated, at end with obl. pellucid spots

and Miscellaneous Particulars.

formed in this country: it was left to Ashmole, from whom it came to the university of Oxford, bearing his name All the species are of the easiest culture, but few of them can be called beautiful. T virginica is usually admitted as a border-flower.

766 *Dichorizandra.* A name contrived by Mikan, from δις, two, χωρις, separately, and ανηρ, in botanical composition, a stamen, to express the separation of two anthers, upon which the character of the genus depends. Beautiful herbaceous stove plants, with the foliage of Commelina or Tradescantia.



767. *Agapanthus* From αγαπαω, to love, and ανθος, a flower, lovely-flower. The blossoms are of a bright agreeable blue color, and the plant itself much prized. It is nearly hardy, and cultivated without any trouble, in large pots of common earth.

768 *Blandfordia* In compliment to George, Marquis of Blandford, son of the second Duke of Marlborough, a lover of plants, but not of honor. Beautiful New Holland liliaceous plants, very rarely seen in collections Their flowers resemble those of Cyrtanthus.

769 *Hemerocallis* From ημερα, the day, and καλος, beautiful: beautiful day-lily This is an ornamental genus of the easiest culture. The species are remarkable among border flowers for their fine orange, yellow, or blue flowers. The Hemerocallis cærulea has been considered a distinct genus by Mr. Salisbury, and called *Saussurea.*

770 *Aloe.* A word for which several derivations have been offered. That it has been obtained from the Arabic *álloeh*, seems most probable. The genus has been divided by Mr. A H. Haworth and others into

History, Use, Propagation, Culture,

many genera, but their opinion has not been adopted by men of science The species consist of odd looking **succulents**; some of them may be classed as trees, others as shrubs, but the greater number have more the habit and appearance of evergreen herbaceous plants One or two species are used in medicine or the arts

A. vulgaris purpurascens, soccotrina, and arborescens, which some consider as not specifically different

4397 Leaves very green, Spines marginal herbaceous, Tubercles numerous
4398 Leaves expanded lanceolate flat above, with the edges cartilaginous thick ciliated
4399 Leaves erect recurved subulate all over rough, Tubercles very minute numerous and pearly
4400 Leaves erect recurved subulate, Tubercles above large pearly below very minute
4401 Leaves spreading ovate acuminate with very numerous small warts
4402 Leaves long oblong acuminate with middle-sized pearly warts in rows
4403 Dichotomous, Leaves long ovate acuminate with great pearly warts, Capsules wrinkled across
4404 Stemless, Lvs. ovate acum cuspidate upw. 3-cor. keeled, Edges and keeled cren with coarse pearly warts
4405 Leaves rigid spirally 5-farious ovate acuminate sparingly warted with dark-green tubercles
4406 Leaves spirally trifarious recurved at end covered all over with minute dark-green warts
4407 Lvs. multifarious cordate very hard deep-green twice keeled, with dark-green raised warts on under side

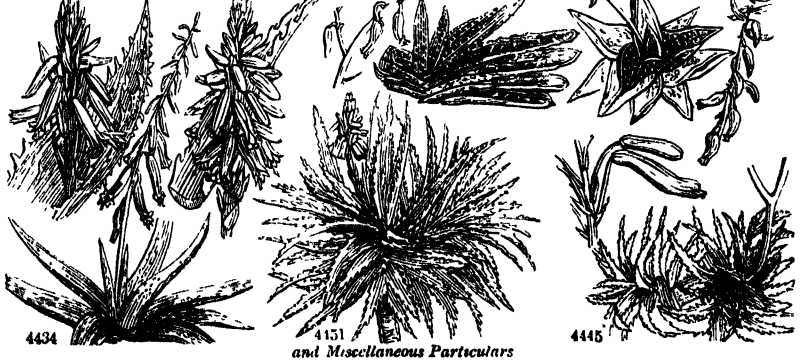
§ 2. *Flowers small Cor regular.*

4408 Leaves very spiral 5-farious ovate acum smooth dark-green with some obscure spots beneath
4409 Leaves very spiral 5-farious lanc. acumin smooth pale-green with some obscure spots beneath
4410 Leaves 5-farious and spiral smooth green obsoletely spotted beneath

4411 Erect rounded, Cor rugose, Leaves multifarious erect polished not spotted
4412 Leaves multifarious very short and close together orbic ovate horizontal polished bright green
4413 Stemless dichotomous, Leaves dark-green erect ovate obl acum mucronate
4414 Leaves upright straight the old ones incurved ovate-obl. abruptly acuminate with small warts
4415 Soboliferous, Leaves spreading ovate acute with large warts
4416 Leaves erect lanc. acuminate above flat and smooth barred with large warts beneath
4417 Leaves semi-cylindrical 3-cornered thickened upwards very rough except at base
4418 Leaves attenuated erect with large white warts depressed in the centre
4419 Stem twisted, Leaves trifarious spiral imbricated spreading ovate acute smooth
4420 Leaves nearly trifarious densely imbricated spreading with an obtuse recurved point
4421 Leaves very rigid cordate stem-clasping thick dark-green above keeled and rough, Edge rough
4422 Leaves rigid rounded cordate closely inflexed dark-green edged a little rough above
4423 Leaves spirally trifarious blackish-green equilaterally triangular very rough
4424 Leaves close spirally trifarious blackish quite smooth outside, Stem much branched

§ 3 *Flowers curved* (GASTERIA *Haw*)

4425 Differs from A. acinacifolia only in having blunter points to the leaves
4426 Leaves lorate lanceolate with a long bristly point keeled above at the edge fringed with membr bristles
4427 Leaves spirally multifarious mottled narrow linguiform obtuse with a point
4428 Leaves tongue-shaped smooth pointed, Flowers racemose cernuous curved
4429 Differs from A lingua only in having broader and shorter leaves
4430 Smooth, Lvs multifarious acuminate spotted deeply keeled beneath with a cartilaginous edge and keel
4431 Stemless, Leaves acinaciform papillose
4432 Leaves distichous tongue-shaped acute spotted serrated with tubercles at edge
4433 Leaves distichous tongue-shaped retuse with a point obscurely spotted curved to one side
4434 Stemless, Leaves distichous acinaciform with cartilaginous prickly edges
4435 Leaves exactly distichous parabolically tongue-shaped short obtuse with edges smooth upwards
4436 Leaves bifarious ensiform bright-green
4437 Leaves ensiform acute papillose distichous
4438 Leaves spiral multifarious shining deeply keeled at the sides obscurely spotted, Edges cartilaginous
4439 Lvs bright-green multifarious spreading with white warts obtuse with a point, Edges densely cartilaginous
4440 Leaves oblong acute entire above towards the end swollen pellucid with darker markings

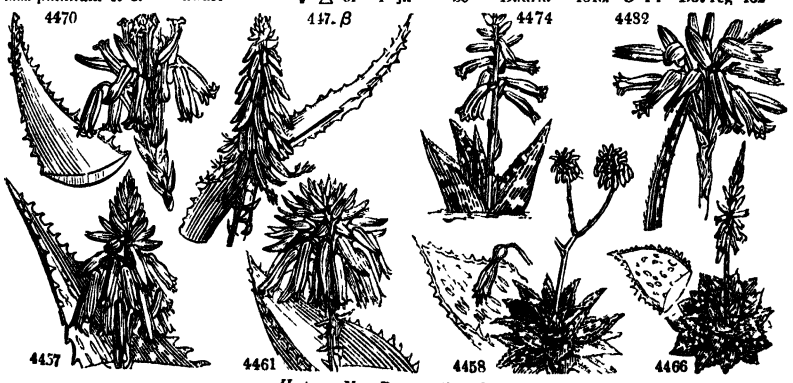


§ 4 *Flowers large* (ALOE)

* *Stemless*

4441 Leaves acuminate glaucous above flat smooth sparingly prickly beneath very rough
4442 Leaves acuminate above a little hollow very prickly all over
4443 Stemless, Leaves spiny ascending 3-cornered subulate
4444 Leaves distichous ensate lean smooth beneath white with warts running together
4445 Leaves oblong lanceolate green sparingly spotted, Edges with a few distant green spines
4446 Stem dichotomous, Leaves ensiform serrated, Stamens longer than cor
4447 Stem shrubby simple, Lvs revol recurved narrow ensiform glauc Warts prickly scatt. over both sides
4448 Leaves very green erect recurved, marginal and dorsal spines at the end red
4449 Leaves oblong lanceolate spiny toothed beneath white with warts, Petals unequal

** *With a stem*



4450 Leaves spreading ascending spiny at edge, Pedunc branched, Branches with a double bract
4451 Leaves ensiform glaucous recurved at end, Marginal serratures white
4452 Leaves oblong ensiform somewhat spotted, Edges cernuous white with straight spines
4453 Leaves stem-clasping reflexed spiny at edge
4454 Leaves ovate ensiform glaucous deflexed covered over especially beneath with scattered spines
4455 Leaves oblong ensiform glaucous incurved above smooth beneath covered with scattered prickly warts

and Miscellaneous Particulars

are cultivated in Barbadoes and other West India islands, to obtain the hepatic aloes, which are brought to England and used chiefly for horses The aloes known by the name of Succotrine, is made chiefly from the species of that name, and A. spicata; being originally manufactured in the island of Zocotra or Socotora, in the straits of Babelmandel it retains the name: this drug is lighter colored, and not so coarse as the horse or

History, Use, Propagation, Culture,

hepatic aloes A spicata is cultivated extensively at the Cape of Good Hope, and a considerable part of what is sold as coming from Socotora is from that quarter All the medicinal aloes are grown on the poorest soil In preparing the drug, the leaves are cut off close to the stem, then cut in pieces, and the juice expressed, this is allowed to remain at rest for forty-eight hours, during which time a feculent matter is deposited, after which the supernatant liquor is poured off into flat dishes and evaporated in the sun At the Cape, in the month of July, the leaves are pulled, then cut into pieces, the juice expressed, and inspissated by means of heat

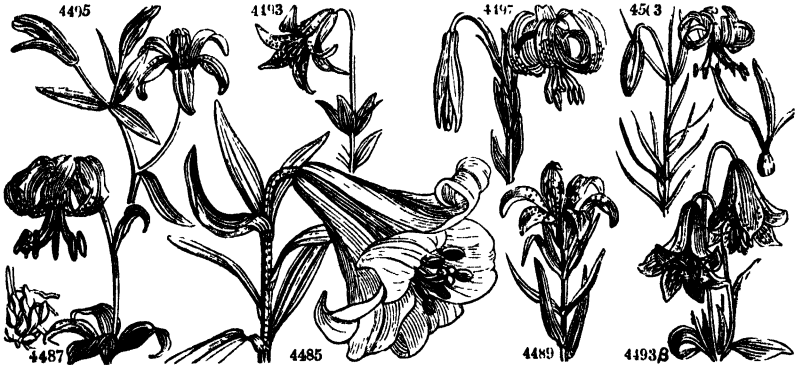
The month of March is the period for cutting the aloes in the island of Barbadoes The leaves are cut off close to the stem, and disposed in tubs, in such a manner that the juice runs out. After a sufficient quantity of it is collected, it is exposed to heat in copper boilers, and as it becomes more inspissated by a constant and regular fire, it is ladled from one boiler to another, and fresh juice added, until that in the last, which is called the *teache*, acquires the consistence of honey, when it is poured into calabashes, and hardens by age. It is

4456 Suckers from the root, Lvs. obl. acum. glauc. spread. cover. at side and back with very broad brown spines
4457 Caulescent, Leaves ensiform toothed mottled spreading
4458 Leaves ovate lanc pale-green with obl obsolete whitish barred spots, Spines rufous
4459 Leaves obl lanc dull green rather glaucous with obl. large transverse spots and rufous spines
4460 Leaves spotted, Edges and keel serrulate at end
4461 Leaves thick spiny at edge below spinulose appressed not dotted, Racemes in umbels
4462 Leaves erect broadly ovate acute, Spines marginal numerous white
4463 Leaves erect spreading remote ovate acute, Spines marg. few large yellow
4464 Leaves ovate acum green, Edge and keel very spiny, Spines long very white
4465 Leaves cæspitose very short glaucous 3-cornered at end, Angles with numerous white spines
4466 Distinguished from A serra by the spines not being united at base
4467 Leaves acuminate above flat smooth beneath warted
4468 Leaves glaucous streaked, Edges obsoletely toothletted

4469 Leaves green lined, Spines red
4470 Leaves very glaucous, Spines red
4471 Leaves lorate ensiform downward spotted with white, Marginal spines middle-sized red
4472 Leaves broad ensiform recurved smooth hard, Spines marginal and dorsal red at end

4473 Leaves tongue-shaped smooth distichous, Flowers racemose pendulous cylindrical
4474 Leaves trifarious painted channelled, Angles cartilaginous
4475 Leaves ovate oblong attenuate spreading glaucous, The edge and keel upwards with white spines
4476 Caudex leafy, Leaves lorate ensiform channelled spreading green serrulate
4477 Glaucous polished, Leaves oblong acuminate with a deep white entire cartilaginous edge
4478 Leaves tufted with the spines of the edge united at base, Scape toothed
4479 Leaves smooth pale-green straight erect-spreading soft
4480 Leaves lorate lanceolate acuminate green, Edge red with many white teeth
4481 Stem shrubby, Leaves long-lanceolate recurved at end glaucous smooth spotted with red spines
4482 Lvs narrow sword-shaped beneath spotted with white, Spots warty scatt Edge with minute white spines
4483 Caulescent, Lvs ovate acum glaucous spreading at the edge and back spiny, Spines very broad yellow

4484 Leaves lanc scattered narrowed at base, Cor campan smooth inside
4485 Leaves scattered lanc Cor cernuous campanulate
4486 Leaves scattered lanceolate, Cor tubular campan Stem smooth
4487 Leaves nerveless whorled cuneate-lanceolate, Flowers solitary with revolute spotted sepals



4488 Leaves scattered, Cor campan upright rough inside

4489 Leaves scattered lanc the upper whorled, Stem 1-flowered winged

4490 Leaves scatt lanc obl Cor erect revol camp within papillose without smooth
4491 Leaves scatt lin lanc Stem 1-flowered, Cor erect, Pet with long claws wavy at edge reflexed at end
4492 Leaves whorled, Flowers erect, Cor campan Petals clawed

4493 Leaves whorled linear, Flowers reflexed, Cor revolute campanulate

4494 Lower leaves whorled, upper scatt Flowers racemose reflexed, Cor revolute
4495 Leaves whorled ovate lanceolate, Flowers reflexed, Cor revolute
4496 Leaves ternate or scattered lin falc 3-nerved ciliated, Pedunc pubes Cor erect rough inside
4497 Leaves ternate or scattered linear 3-nerved ciliated, Pedunc tomentose, Flowers erect rough inside
4498 Leaves lin lanc scattered, Flowers reflexed, Cor revolute dotted inside
4499 Leaves scattered linear, Pedunc long, Flowers reflexed, Cor revolute papillose inside
4500 Leaves scattered lin subulate, Flowers reflexed, Cor revolute toothed and warted inside
4501 Like a Martagon, but the stamens are united in a tube
4502 Leaves scattered sessile 5-nerved, The upper cord ovate, Cor revolute papillose inside
4503 Leaves linear subulate scattered smooth, Flowers reflexed, Sepals revolute smooth inside

and Miscellaneous Particulars

brought home in these calabashes, or large gourd-shells, which contain from sixty to seventy pounds weight each (*Thomson's Mat. Med.* 141)

In the West Indies, the Cape, and most countries where the woody prickly species abound naturally, they are planted as hedges, and the fibres of the leaves, after being macerated for juice, manufactured into cordage or coarse cloth

A. picta, latifolia, and saponaria are so named from the spots of the leaves, which are of the color of soft soap

The curious species of aloes, inhabitants of the greenhouse, require but little water sandy loam, mixed with a little lime rubbish or gravel, suits them best, and they flower more abundantly by being exposed to the open air in summer They are increased by suckers, or leaves, stripped off the plants and laid on a pot of mould, or planted shallow in it, will produce young plants (*Bot Cult* 130)

771 *Lilium.* From the Celtic word *Li*, which signifies whiteness. The lily has always been considered the

History, Use, Propagation, Culture,

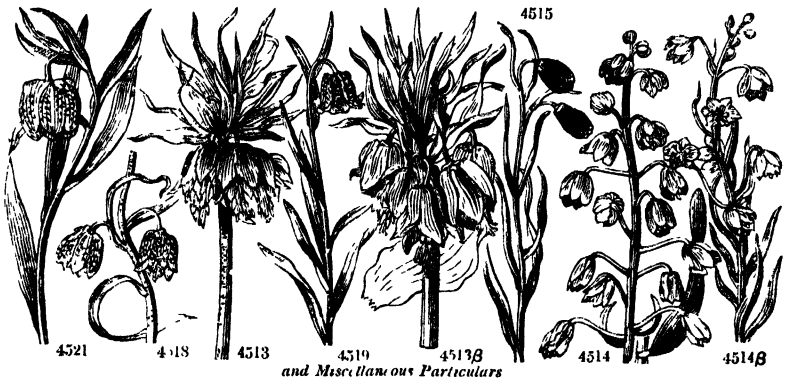
emblem of whiteness This is a splendid genus, all the species of which are considered border flowers of great beauty The more common sorts, species, and varieties, will thrive in any soil and situation, even under the shade of trees The Canadian, Pomponian, and Philadelphian martagons are somewhat tender, and require the protection of ashes or rotten bark in winter They are generally planted in borders, and need not be taken up oftener than every three or four years in September, and replanted six inches deep in the October following None of the species can be safely transplanted after they have pushed leaves, without weakening them so as to prevent their flowering for several years This remark, indeed, will apply to most bulbous rooted plants Mr Griffin, of South Lambeth, whose superior skill in the cultivation of bulbous plants is well known (*Hort Trans* iv 344), has been in the practice of keeping the lilium japonicum in pots, protected by a greenhouse or garden frame but he thinks they thrive best in the former He places the bulb in twenty-four sized pots, not lower than an inch from the surface of the mould, which is composed of about two-thirds peat and one-third loam, the bottom of the pot being covered to the depth of two inches, with broken pieces of tile and the rough siftings of peat The plants are kept entirely from frost, and are watered very little when in a dormant state, for they are then very impatient of wet in excess The pots kept in the greenhouse are placed at a distance from the flue to prevent the mould drying quickly (*Hort Trans* iv 554.) Mr S Brooks grows in a brick-pit, which he can cover with mats or glasses at pleasure, but he says, it "appears to be sufficiently hardy to endure our winters, as I have had a bed of them two years in the open ground without protection" (*Hort Trans* iv 552)

772 *Tulipa* Linnæus classed this among barbarous names In Persian it is called *thoolybân* (*De Souza*), whence undoubtedly its origin In old French it is called *tulipan* T Gesneriana (Gesner, a Zurich botanist), may be called the king of florists' flowers, having been a prime object of attention with this class of cultivators for nearly three centuries It appears to have been brought to Europe from Persia by way of Constantinople in 1559, and in a century afterwards to have become an object of considerable trade in the Netherlands, and a sort of mania among the growers, who bought and sold bulbs at prices amounting to 500*l.* sterling and upwards, in those days an immense sum The taste for tulips in England was at its greatest height about the end of the seventeenth and the beginning of the eighteenth century It afterwards declined, and gave way to a taste for rare plants from foreign countries The tulip, however, is still extensively cultivated in Holland, from which all Europe is supplied with bulbs, and also to a considerable extent in England, both in tradesmen's gardens and in those of the opulent It is, however, like the auricula, pink, &c more the poor man's flower than that of the botanists or country gentleman

The varieties of the tulip are endless, and their names arbitrary, like those of all florists' flowers One of the latest London catalogues (Mason's) enumerates six sorts of early blowing tulips, four perroquets or middle blowers, twenty-two double sorts, and upwards of 100 single late sorts; the last being the only sorts valued by florists as competition flowers These late sorts are classed by the Dutch as under.—

Prime baguets (*baguette*, Fr, a rod or wand), very tall, fine cups with white bottoms, well broken with fine brown, and all from the same breeder

Baguets Rigaut's (supposed from Rigaud, some eminent florist's name, or *rougeaude*, red face); not quite so tall, but with strong stems, and very large well-formed cups, with white bottoms, well broken with fine brown, and all from the same breeder



4504 Stem 1-fl smooth, Flower nodding, Petals acute bearded at end, Leaves lanceolate
4505 Flower erect, Petals lanceol acuminate, Leaves lanceolate linear
4506 Coat of bulb woolly inside, Leaves ciliated glaucous, Stem and flower smooth
4507 Stem 1-fl smooth, Flower erect, Petals obtuse smooth, Leaves ovate lanceolate
4508 Stem 1-fl pubescent, Flower erect, Petals obtuse smooth, Leaves ovate lanceolate
4509 Flower erect stellate with a dark eye, Leaves linear lanceolate
4510 Leaves lin. lanc convolute, Petals lanceolate greenish outside
4511 One-flowered, Flower from fusiform spreading, Sepals very long caudate
4512 Flowers erect flat, Stem 2-leaved 2-3-flowered, Leaves linear subulate

4513 Raceme comose naked below, Leaves entire

4514 Raceme naked, Leaves oblique

4515 Leaves glaucous numerous oblique, Cor. turbinate
4516 Leaves lanc alternate remote, Stem 1-flowered naked upwards, Angles of caps obtuse
4517 Leaves linear whorled opp and alternate when old cirrhose, Stem many-flowered, Capsule winged
4518 Lower leaves opp Inner flowers among the leaves
4519 Leaves scattered flat coriaceous glaucous, Cor campanulate revolute at end
4520 Leaves alternate linear nerved flat, Stem 1-flowered
4521 Leaves lin lanc alternate, the upper approximated shorter than the terminal solitary flower
4522 Leaves lanc approximated, the upper opp as long as the terminal solitary flower, Capsule obtuse angled
4523 Leaves alternate linear channelled, Stem one-flowered
4524 Leaves whorled, Flower erect, Cor campanulate, Petals sessile

4525 Leaves fleshy spiny at end
4526 Herbaceous caulescent, Leaves ensiform

and Miscellaneous Particulars

Incomparable Verports, very perfect cups, cherry and rose, and white bottoms, well broken with shining brown

Byblomens, or mixt flowers, the *flamands* of the French florists, with bottoms white, or nearly so, from different breeders, and broken with variety of colors

Bizarres (*bizarre*, Fr odd, irregular), ground yellow, from different breeders, and broken with variety of colors

What are called breeders are procured from seed, and consist of one plain color on a white or yellow bottom. These being cultivated on a dry and rather poor soil, become broken or variegated, and produce new varieties The time that elapses before they break, varies from one to twenty years or more, and sometimes this change never takes place, so that whoever thinks of raising new varieties of tulips from seed, must be possessed of an ample fund of patience and perseverance The early dwarf tulip, known among florists as the Van Thoil, is a distinct species, T. suaveolens

In raising tulips from seed, the florists pursue a mode in some respects the reverse of that practised with other plants Instead of saving the seed to be sown from the finest variegated tulips, they prefer unbroken flowers or breeders, selecting such of these as have tall strong stems, with large well-formed cups, clear in the bottom Plants raised from seed saved from the finer variegated sorts, form poor weak breeders of no value. The seed is sown on fine light soil, thinly covered, and protected and shaded by a frame At the end of the second year the bulbs are taken up and replanted three inches apart, and again at the end of the fourth year Some will bloom the fourth year, most the fifth, and all of them the seventh year Being now furnished with a set of breeders, all that the florist can do is to take up and replant till they break or shew variegation, which, as already observed, some will do in a year or two, and some not for a long period, or never. Some vary the soil to promote breaking, but in doing this there is often danger of weakening the strength of the flower

In cultivating choice tulips, an open airy situation, dry at bottom, is made choice of, there excavations are made commonly in the form of beds four feet broad, of any convenient length, and two and a half or three feet deep In the bottom a layer of well rotten hot-bed dung is laid and well trod in, and on this two or two and a half feet of rich fresh sandy loam. On this the roots are planted six inches apart, and covered four inches. The best season is the beginning of November In very severe winters, protection by mats or by a layer of decayed tanner's bark, may be requisite; but the tulip is very hardy, and almost the only protection it requires is shading and shielding from rain and winds during full bloom The bulbs should be taken up annually, as soon as the flowers are decayed, and kept in a dry airy situation till wanted for planting. (See *Maddocks*, *Hogg*, *Emerton*, &c)

T clusiana and T celsiana are both elegant little border bulbs, inferior indeed to their prototypes in splendour of coloring, but more elegant in their simplicity.

773. *Fritillaria* *Fritillus* signifies a dice-box, and is said to have been the origin of this name This is a genus with flowers shewy and angular in appearance. They require a deep loamy soil, and are readily increased by offsets or seeds They will grow in the shade of trees and shrubs, and do not require to be taken up above once in three years.

774 *Dracæna* From Δρακαινα, the female of δρακων, a dragon, because the inspissated juice becomes a red powder very like the eastern dragon's blood D. draco has the habit of a palm. The trunk is nearly

History, Use, Propagation, Culture,

equal in size, which is rarely more than eight or ten inches the whole length; the inner part very pithy, next to this a circle of strong fibres, and the outside soft, the same diameter the whole length, circular marks or rings are left the whole length where the leaves have fallen off The top sustains a large head of these, coming out singly all round it

775 *Phylloma* From φυλλον, a leaf, and λωμα, an edge, in reference to the broad red edge of the leaves. The plant resembles an aloe in foliage and flowers, and requires the same culture

776. *Aletris* From αλ ιας, meal, in allusion to the powdery dust with which the whole plant appears to be covered. Small North American plants, which may be cultivated with a little attention in rich leaf mould

777. *Tritoma* From τριτος, three, and τεμνω, to cut, in allusion to the three sharp edges of the ends of the leaves. (v *Ker, in Bot. Mag.* fol 744) The species of this genus thrive best in peat soil, but will do very well in any other light earth They are hardy enough to endure our mildest winters in the open air, and only require the protection of a frame in severe frosts There being also a genus of insects called Tritoma, Professor Link calls this genus Tritomanthe

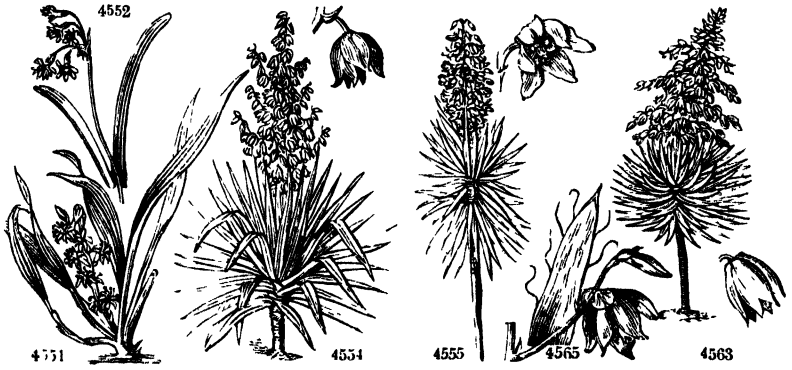
778. *Veltheimia.* Frederick Augustus de Veltheim was a German botanical amateur, of whom nothing more is known. This genus resembles the last, and is of easy culture in any light loamy soil, and readily increased

4527 Leaves lanceolate narrowed each way, Corymb very short terminal many-flowered
4528 Leaves lanc. obliquely bent, Panicle hanging down divaricating
4529 Leaves lanceolate acute discolored
4530 Leaves lanceolate lax, Flowers very fragrant
4531 Head of flowers sessile in the centre of the ovate leaves

4532 Leaves tooth-spiny, Racemes axillary

4533 Flowers stalked oblong tubular, Cor in fruit smooth mealy, Leaves broad lanceolate mucronate
4534 Flowers sub-sessile campanulate, Cor in fruit rugose very rough, Leaves lanc ensiform acute

4535 Leaves with the keel and edge rough, Cor clavate cylindrical
4536 Leaves with keel and edge smooth, Cor clavate cylindrical
4537 Leaves with keel and edge rough, Cor globose at end



4538 Leaves lanc plaited wavy obtuse, Teeth of the limb rounded straight
4539 Leaves lanc. glaucous curled at edge mucronate at end, Limb spreading

4540 Leaves about 11 spreading flaccid broadly lanceol ensiform glaucous obscurely barred
4541 Leaves beneath convex lined channelled not barred
4542 Leaves about 19 sub-erect rigid brittle broad lanceolate ensiform glaucous obscurely barred
4543 Leaves lanc uniform, Style twice as long as stamens, Bractes thrice as short as tube of cor Flow sessile
4544 Leaves about three flaccid lanc. ensiform pale-green with scarcely any bars
4545 Leaves lanc revolute recurved dull green slightly edged with fulvous
4546 Leaves about eleven nearly erect rigid brittle lanc ensif with very obscure bars
4547 Leaves smooth oblong acute flat and lin lanceolate channelled, Style the length of stamens
4548 Leaves with woolly nerves lower oblong, rest lin Pedunc without bractee
4549 Leaves about 12 sub-erect lanc ensif much barred with a small bristle at end
4550 Leaves about 20 spreading lanc ensif much barred, with 4-6 strong lines beneath
4551 Leaves distichous lanceolate ensiform keeled, Flowers solitary sessile

4552 Nectary 1-leaved 6-toothed
4553 Nectary 3-leaved

4554 Leaves quite entire
4555 Leaves crenulate straight
4556 Leaves linear very narrow stiff closely curved back into a semicircle serrulate at edge
4557 Leaves crenate nodding
4558 Leaves erect incurved rough on both sides dull glaucous with strong white marginal threads
4559 Leaves lorate linear lanc obliquely bent glaucous, Suckers tuberous

4560 Leaves all very flaccid weakly recurved with very strong brownish threads
4561 Leaves in a close head very stiff green rough at edge
4562 Leaves recurved deflexed with a few threads
4563 Leaves a little plaited mucronate, Flowers very close together camp not opening curved outwards at end
4564 Leaves linear lanc narrow glaucous with fine white marginal threads
4565 Leaves erect recurved broadly channelled with very strong twisted brown marginal threads

and Miscellaneous Particulars

by offsets from the bulbs, or by pulling off the leaves close to the bulb, and then planting them in pots of mould, when, like most other bulbous rooted plants, they will produce bulbs at their base The species are quite hardy, although usually treated as greenhouse plants.

779. ***Sanseviera*** This is a succulent genus, of the easiest culture and propagation in sandy loam with little water. It is probable that nearly all the numerous kinds adopted here from the works of Mr A H. Haworth, are varieties of one common stock, which in the woods of Guinea sports into an infinite number of forms.

780. ***Tulbaghia*** This was named in honor of —— Tulbagh, a Dutch governor of the Cape of Good Hope, who patronized travelling naturalists Very pretty plants, less fragrant than beautiful, they are rarely seen in collections, but may be cultivated in very light sandy peat in a good greenhouse

781 ***Yucca.*** The inhabitants of St. Domingo call this plant *Yuca* The species are considered highly desirable from their palm, or oriental pine-apple, or aloe character, and as being evergreens. For this reason they make a striking contrast in gardens and shrubberies, with European shrubs They grow slowly, and do not flower freely They are well adapted for a conservatory, as even the reputed hardy species do not thrive generally in the open air

History, Use, Propagation, Culture,

782 *Erythrónium* From ἐρυθρός, red, in allusion to the color of the flower and leaves Beautiful little vernal bulbs, the favorites of gardeners, from the cottager's border to the nobleman's flower garden The E. americanum runs very much at the root, and will not flower unless confined and prevented wasting its vigour in long subterraneous surculi

783 *Gloriosa* So named on account of the glorious colors of its flowers, and the elegance of their form This is a splendid and curious genus, which requires considerable care in its treatment so as to make it flower freely The late John Sweet, of Bristol, has given the following directions, "When the stalks and foliage have decayed in the autumn, and left the root, like a well-ripened potatoe, in a dormant state, the pot in which it is, must be removed from the bark-bed (to a dry part of the house) at some distance from the fire · all the warmth at this time necessary being merely what is sufficient to keep the earth in the pot free from damp · and to prevent the waterings of the house, or other moisture, falling on the earth in the pot, it should be covered, by inverting upon it another pot of the same size, or if larger, it will hang over its edges, and more effectually exclude the wet. If the roots are small, two or three may be placed together in the same pot, whilst in their dormant state, but if they are thus shifted, the mould must be well shaken down in the pot, in order to prevent the access of air to them the old mould in which they grew must also be used; for fresh earth or sand would stimulate them to move too early About the second week in March, the roots must be replanted, putting one or two, according to their size, into pots measuring six inches over The best compost for them is fresh loam, mixed with an equal quantity of peat-mould, of good quality, the loam should be good, not over rich with dung, nor too heavy The roots are to be covered about two inches deep; and care must be taken not to break them, unless nature has shown where it is practicable to divide them easily. The pots, when filled, must be plunged into the bark-bed, where the heat should be equal to ninety-five degrees of Fahrenheit's scale. Water is to be given very sparingly at first, and though, as they grow,

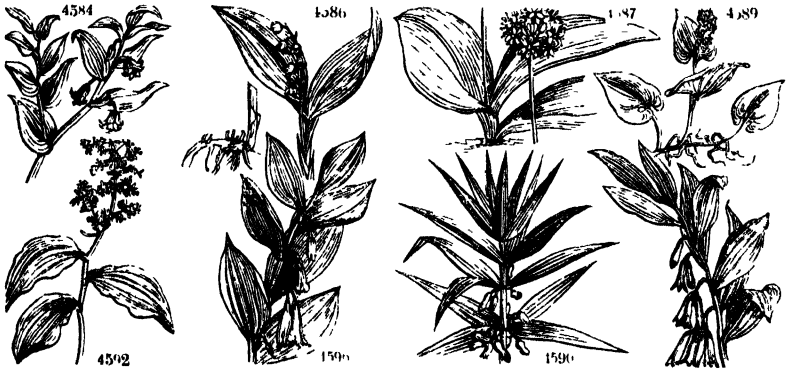
4566 Leaves erect lin. lanc. flaccid glaucous green quite smooth with a slight red edge
4567 Stemless, Leaves linear very straight, Scape branched at base, Cor round campanulate
4568 Leaves few loosely headed long lanceolate, their edges rough
4569 Leaves erect rigid narrow ensiform glaucous with a broad white edge and a few threads
4570 Leaves a little recurved glaucous lin lanc. at the edge and keel rough, beneath glaucous
4571 Leaves lin lanceolate recurved almost into a circle deep green 7-8 lines broad roundish at edge

4572 Style filiform

4573 Style clavate 3-cornered

4574 Leaves cirrhiferous
4575 Leaves acuminate

4576 A small plant like a Crocus



4577 Leaves perfoliate ovate
4578 Leaves perfoliate elliptic oblong obtuse, Cor narrowed at base scabrous within, Anthers cuspidate
4579 Leaves perfoliate ovate lanceolate acute
4580 Leaves perfoliate oblong acute, Petals smooth on both sides, Nect roundish
4581 Leaves sessile
4582 Leaves stalked

4583 Leaves stem-clasping and stem smooth
4584 Smooth shining, Leaves stem-clasping serrulate ciliated, Anthers short 2-horned
4585 Downy hoary, Leaves sessile cordate acuminate, Pedicels in pairs on a very short stalk

4586 Scape naked smooth, Leaves ovate

4587 Leaves ovate oblong obtuse ciliated, Scape leafless, Umbel capitate
4588 Leaves radical elliptical, Umbel terminal
4589 Leaves cordate, Flowers tetrandrous
4590 Leaves stem-clasping in threes, Raceme terminal simple
4591 Leaves alternate stem-clasping elliptical acute, Raceme terminal simple
4592 Leaves alternate sessile ovate acuminate, Panicle terminal naked

4593 Leaves whorled
4594 Stem furrowed, Leaves alternate amplexicaul oblong pubescent at edge, Pedunc axillary 2 fl
4595 Stem rounded furrowed, Leaves amplexicaul ovate downy beneath, Pedunc axill about 2-fl.
4596 Leaves alternate stem-clasping, Pedunc. axillary 1-fl
4597 Leaves alternate stem-clasping, Stem round, Pedunc axillary many-fl
4598 Leaves alternate stem-clasping acuminate, Stem angular, Pedunc axillary many-fl
4599 Stem round, Leaves opposite oblong acuminate shining, Pedunc umbell 3-5-flowered

and Miscellaneous Particulars.

they will require a more liberal supply, yet it is necessary at all times to be very moderate in giving it The heat must be well kept up, and as the roots extend, they must be supported Under such treatment as I have described, I have known one plant grow ten feet in the course of a season, and to have numerous blossom-stems upon it." It is readily increased by dividing the roots (*Hort Trans* iii 2, 3) The flowers are at first green, they afterwards assume those beautiful markings of yellow for which they are so much esteemed

784. ***Bulbocodium.*** From *βολβος*, a bulb, and *κωδιον*, wool; its bulb is enveloped in a rough and velvetty covering A beautiful little vernal flower resembling a small species of Colchicum.

785. ***Uvularia.*** A diminutive of *uva*, a bunch of grapes. A genus of little beauty and of easy culture,

786. ***Streptopus.*** From *στρεφω*, to turn, and *πους*, a foot, or, in botanical language, stalk. Its flower-stalks are constantly twisted. A plant like an Uvularia in habit.

787. ***Convallaria*** From *convallis*, a valley, in allusion to the places where it grows. (*Muguet*, Fr) C majalis is an elegant and delicate scented plant, which has long been a favorite of the florist, though, as it is not a native of hot countries, it is not likely to be the Lily of the Valley of Solomon Notwithstanding the fragrance of the flowers when green, yet when dried they have a narcotic odour, and if reduced to powder excite sneezing. An extract prepared from the flowers or from the roots partakes of the bitterness, as well as of the purgative properties, of aloes. A beautiful and durable green colour may be prepared from the leaves with lime The plant is very common in the woods about Woburn in Bedfordshire, and from thence the London markets are supplied with the flowers It forces freely, and few plants are more eligible for that operation

788. ***Smilacina*** A diminution of Smilax, another genus of plants, which see in its place These are very pretty little hardy American flowers, requiring some delicacy in their management.

789. ***Polygonatum.*** From *πολυς*, many, and *γονυ*, a knee; on account of the numerous articulations of its

History, Use, Propagation, Culture,

stem The English name arises from the roots, which in P vulgare are full of knots, and a transverse section of them shews characters which dreamers have discovered to represent the impress of the famous seal of Solomon

790. *Ophiopogon* From *οφις*, a snake, and *πωγων*, a beard snake's-beard. This plant is best grown in pots, as it requires the protection of a frame during severe frosts

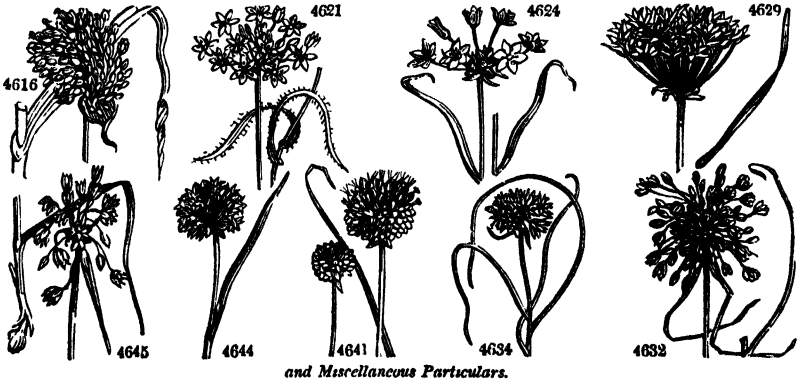
791. *Eucomis* From *ευ*, well, and *κομη*, hair, on account of the fine tuft of leaves, in botanical language called *coma*, by which the stem is surmounted Handsome herbaceous plants which are nearly hardy

792 *Brodiæa.* Named by Sir James Smith, after James Brodie, Esq of Brodie House, a gentleman to whom the botany of Scotland is indebted. Highly curious little plants with blue flowers

793. *Peliosanthes* From *πελιος*, livid, and *ανθος*, a flower, in allusion to the color of the flowers *Teta* is the native of the plant in India, and having been adopted by Dr Roxburgh, ought not to have been neglected in this country.

4600 Scape naked, Leaves linear thrice as long as scape
4601 Scape naked, Raceme spiked, Flowers aggregate

4602 Scape clavate, Leaves broad lanceolate acute
4603 Scape clavate, Leaves multifarious expanded
4604 Scape clavate, Leaves elliptical acute twin lying on the ground
4605 Scape cylindrical, Leaves tongue-shaped obtuse lying on the ground
4606 Scape cylindrical, Leaves ovate oblong wavy spreading, Crown as long as raceme
4607 Scape cylindrical, Leaves oblong lanceolate channelled spreading, Crown short, Racemes long
4608 Scape cylindrical, Leaves lanceolate spreading striped, Crown short, Raceme long



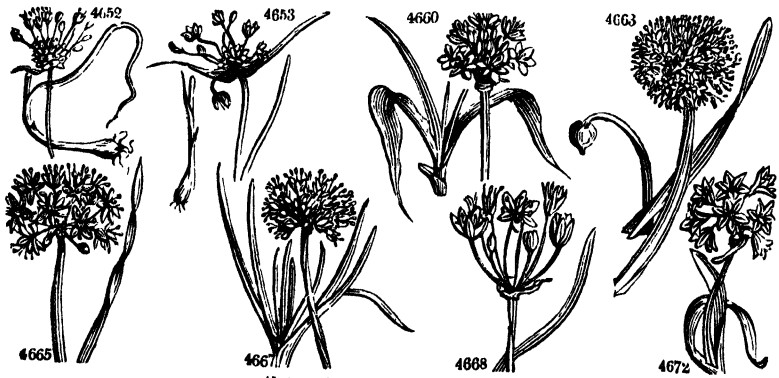
4609 Flowers large lax, Leaves of corona lanceolate undivided
4610 Leaves of the corona subulate
4611 Flowers clustered, Leaves of corona bifid

4612 Scape shorter than ovate-lanceolate leaves
4613 Scape branched longer than leaves

4614 The only species

4615 The only species

A. *Stem leafy Leaves not fistular*
Umbel not bulbiferous Leaves flat
4616 Umb. globose, Stam. 3 cusp Sepals with a rough keel
4617 Stam tricuspidate, Root tunicated
4618 Umb globose, Stam. tricuspidate twice as long as flower
4619 Umb capitate, Stam subulate twice as long as flower
4620 Umb capitate, Stam lanceolate longer than flower, Leaves elliptical
4621 Umb fastigiate, Stam subulate, Leaves linear ciliated
4622 Stam filiform thrice as long as flower, Leaves oblique
4623 Cauline leaves lanceolate, Umbel dense depressed, Stamens subulate shorter than flower
4624 Umb fastigiate, Sepals emarginate, Stamens very short simple
4625 Stam. 3-pointed as long as flower, Leaves very narrow, Scape declinate
4626 Very upright, Leaves channelled
4627 Umb loose few-flowered, Leaves smooth
4628 Very like Allium subhirsutum differing only in the smallness of the flowers, Sepals 3 lines long
Umbel not bulbiferous Leaves not flat
4629 Stamens simple, Umbel flat, Leaves half-rounded
4630 Outer peduncles shorter than the rest, Stamens 3-pointed
4631 Flowers pendulous, Sepals ovate, Stam longer than flower
4632 Flowers pendulous truncated, Stam simple as long as flower
4633 Pedunc capillary effuse, Stam simple, Spathe very long
4634 Stam simple twice as long as flower, Spathe as long as flower-stalks one valve shorter
4635 Umbel globose, Stam 3-pointed, Flowers lateral nodding, Leaves half-round
4636 Stamens simple twice as long as flower, Umbel globose, Spathe subulate very long
4637 Umbel fastigiate about 6-flowered, Sepals acute, Stamens simple, Leaves setaceous
4638 Umbel globose very dense, Spathes lanc as long as flow -stalks, Stam 3-pointed longer than fl Lvs ½ round
4639 Flower-stalks nearly equal, Sepals ovate conniving as long as simple stamens, Style longer than stamens
4640 Spathe ovate shorter than umbel, Stamens simple shorter than flower
4641 Leaves half-round, Stamens 3-pointed longer than flower
4642 Umbel globose, Stamens simple longer than flower, Spathe subulate
4643 Umbel sub-globose, Stamens 3-pointed shorter than flower
Umbel bulbiferous Leaves flat
4644 Sheaths of leaves rounded, Spathe blunt, Stamens 3-pointed
4645 Umbel spreading, Peduncles nodding, Stamens subulate, Spathes with very long points
4646 Flowers all male, Stamens 3-pointed, Spathe with a very long point



and Miscellaneous Particulars.

794. *Aphyllanthes* From *a*, privative, *φυλλον*, leaf, and *ανθος*, a flower, leafless flower. Its stems are naked, like a rush, and bear on their summit a little tuft of blue flowers.

795. *Sowerbæa.* So named in honor of the late James Sowerby, an excellent draughtsman and ingenious naturalist. The power he possessed of representing the general features of plants within the compass of a few inches, as in his English Botany, has never been possessed in the same degree by any other individual than the late Sydenham Edwards. His execution as an artist is fully attested by the superb plates of the Flora Londinensis, of his own Fungi, and indeed of almost every botanical work of merit which appeared during his life. His talents and his reputation are inherited by his sons. This plant requires plenty of water, and is easily increased by dividing the roots

796. *Allium.* From the Celtic *all*, which signifies hot or burning This is a genus of strongly scented bulbous plants, all of them edible, and some of them of the greatest antiquity as potherbs

History, Use, Propagation, Culture,

A Porrum (From *pori*, in Celtic, to eat) *Leek*, Engl, *Poireau*, Fr, *Lauch*, Ger, and *Poro*, Ital, has a cylindrical scaly imperfect bulb, which is blanched in gardens, and much used in soups and stews It is sown in March, transplanted in May in shallow drills, and being slightly earthed up as it advances, is fit for use in October, and remains in that state till April or May following

A. sativum, *Ail*, Fr, *Knoblauch*, Ger, and *Aglio*, Ital, has soboliferous bulbs, which are used in seasoning, and sometimes in medicine It is cultivated by dividing the bulb, and planting the soboles in February or March They are fit to take up in the September following, and laid up in a dry situation till wanted for use

A. scorodoprasum. (From σκοροδον, onion, and πρασον, leek, as it both leek and onion) *Ail d'Espagne*, Fr, *Rockenbolben*, Ger., and *Scorodoprasso*, Ital, has bulbs like garlic, but the soboles or cloves are smaller. It is cultivated for the same purposes as that species, and is considered as having a more delicate flavor.

A. ascalonicum (growing near Ascalon) *Eschalôte*, Fr, *Schalotte*, Ger., and *Scalogna*, Ital., is the mildest of cultivated Alliums. It has a soboliferous bulb, small fistular leaves, and seldom flowers. It is propagated by the clove, planted in autumn or spring, and taken up for use in August or September. It is very subject to insects, which autumn and shallow planting are found to counteract (*Calcd. Mem* i. 109. and *Hort. Trans.* ii. 98. *Encyc of Gard* 3847)

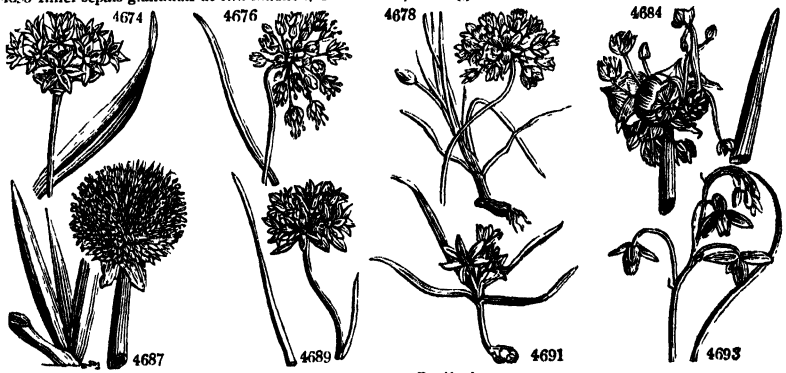
4647 Bulbs compound, Stamens 3-pointed
4648 Leaves crenulate, Sheaths 2-edged, Stamens 3-pointed
4649 Lake Allium carinatum, but the stamens are three-pointed
4650 Stamens subulate twice as long as flower, Spathe longer than umbel

Umbel bulbiferous Leaves not flat

4651 Leaves half round, Spathes much longer than umbel, Sepals obtuse, Stamens simple exserted
4652 Stamens 3-pointed
4653 Leaves rough half-round furrowed beneath, Stamens simple

B *Leaves radical, not fistular*

4654 Scape rounded, Umb many-fl. fastigiate, Leaves linear channelled angular beneath, Stam subulate
4655 Scape rounded, Leaves lin lanceol. Umb fastigiate, Sepals very narrow, Stamens simple
4656 Scape rounded, Leaves lanceolate, Umb hemispherical, Sepals spreading, Stamens simple
4657 Scape rounded, Lvs lin lanc wavy, Umb hemispherical, Roots very long, Stam simple twice as long as fl



4658 Scape oblique 4 cornered, Leaves linear, Umb fastigiate, Stamens simple as long as fl
4659 Scape rounded, Leaves half-round, Spathe acum longer than umbel, Stam simple longer than flower
4660 Scape ½ rounded, Leaves lanceolate acuminate flaccid ciliated sheathing, Umbel fastigiate, Sepals obtuse
4661 Scape 2-edged angular, Umbel clustered, Stamens simple as long as flower, Leaves linear oblique
4662 Scape nearly 2-edged, Umbel capitate, Stamens longer than flower, Leaves linear spiral
4663 Scape 2-edged, Umb. drooping before flowering, afterw erect, Lvs lin flat, Stam 3-pointed longer than fl
4664 Scape rounded, Leaves subulate, Umbel globose, Stamens 3-pointed
4665 Scape 2-edged, Leaves linear convex and smooth beneath, Umbel roundish, Stamens subulate
4666 Scape rounded very long, Leaves linear channelled, Stamens subulate connate at base
4667 Scape 2-edged, Leaves linear channelled angular beneath, Umbel fastigiate
4668 Scape 3-cornered shorter than the lin furrowed leaves, Umb fastigiate, Stamens simple, Sepals obtuse
4669 Scape rounded longer than the linear subulate leaves, Umb fastig Stamens simple, Sepals mucronate
4670 Scape rounded, Leaves linear
4671 Scape 3-cornered, Leaves lanceolate stalked, Umbels fastigiate
4672 Scape and leaves 3-cornered, Stamens simple
4673 Scape rounded, Leaves linear flat ciliated, Umb few-flowered, Sepals obovate concave
4674 Scape nearly cylindrical, Leaves lanceolate sessile, Umbel fastigiate
4675 Scape half-round, Leaves lanceolate oblong flat smooth, Umbel globose, Seeds solitary
4676 Scape 4-cornered, Umb fastigiate cernuous, Leaves linear flat, Stamens subulate longer than flower
4677 Leaves twisted linear, Umbel loose, Filam subulate as long as flower
4678 Scape rounded longer than leaves, Umb compact, Stam subul as long as flower
4679 Scape rounded at end, Umbel half globose, Leaves linear flat chann at base, Stam subul longer than fl
4680 Scape rounded, Umb fastigiate, Leaves half-round compressed, Stam lanceolate shorter than fl
4681 Scape rounded, Umb few-flowered fastigiate, Leaves lin channelled, Stam lanceolate shorter than fl.

C *Leaves fistular.*

4682 Scape leafy, Umb fastigiate, Spathes nearly equal, Sepals mucronate
4683 Scape leafy at base
4684 Scape fistular twisted, Umb bulbiferous proliferous, Stamens 3-pointed
4685 Scape rounded with an angle, Leaves linear obtuse, Umb rounded, Stamens setaceous twice as long as fl.
4686 Scape ventricose beneath longer than the round leaves
4687 Scape as long as the round ventricose leaves
4688 Scape as long as the round subulate leaves
4689 Scape not quite naked round, Leaves half-round, Stamens subulate, Sepals lanceolate acute
4690 Scape round, Leaves setaceous subulate ciliated, Sepals ovate lanceolate emarginate at ends
4691 Scape scarcely any, Capsules cernuous, Leaves flat ciliated

§ 1 *Three stamens fertile.*

4692 Inner sepals glandular at end inflexed, Leaves subulate channelled recurved
4693 Inner sepals glandular at end inflexed, Peduncles spreading, Leaves linear lanc flat reflexed

and Miscellaneous Particulars

A cepa (*Cep* signifies head in Celtic) *Oignon*, Fr, *Zwiebel*, Ger. and *Cipolla*, Ital, is universally cultivated for the kitchen, and is used as a pot-herb, salad, and pickle. It is commonly raised from seed, which is sown on rich, loamy, and rather moist soil, in March; and being thinned, weeded, and the soil stirred, the bulbs will be fit to take up in September, when they may be kept through the winter like potatoes or apples It is also grown from small bulbs, which are planted on the surface of the soil in March, and swell to a large size (if not earthed up) in the course of the season. Sometimes onion-seeds are sown in autumn in a very dry situation, and the young plants are taken up and transplanted in spring or a sowing is made very early in spring on a warm border or on a hot-bed, and the crop transplanted from that

There is a variety called the underground-onion, which multiplies its bulbs by offsets below the surface

The species called the tree onion, like several others, produces its bulbs instead of or among the umbel of flowers It is occasionally cultivated, but chiefly as matter of curiosity.

A. fistulosum is grown chiefly as a scallion, or spring salad onion. It has almost no bulb, but large succulent fistular leaves, strong in flavor It is sown in autumn, and fit to be used in spring

797 *Albuca*. Derived from *albus*, white, in allusion to the color of the flowers of this genus. Not a very happy allusion though, because the flowers are mostly green The stem of the Asphodel was called *albucus* by

History, Use, Propagation, Culture,

the Latins A genus of little beauty, but of easy management in sandy loam and decayed vegetable soil, and propagation is effected by suckers from the old bulbs, or by taking off leaves with a scale, and planting them round the edge of a pot of sandy loam

798 *Xanthorrhœa.* From ξανθος, yellow, and ῥεω, to flow. The plant produces a yellow gum

799 *Thysanotus* From θυσανος, a fringe, on account of the fringe of the sepals. Elegant little New Holland plants, with bright purple blossoms and slender grassy leaves

800 *Eriospermum.* From εριον, wool, and σπερμα, seed, on account of the envelope of the seed. Very curious little Cape plants, with deformed or unusually shapen leaves

801. *Gagea.* Named by R. A Salisbury, Esq, after his friend Sir Thomas Gage, a great amateur of botany. A genus of curious little bulbous plants, none of which exceed the height of more than three or four inches, and principally distinguished from Ornithogalum by the yellow color of their flowers.

4694 Inner sepals glandular at end inflexed, Scape erect, Fl nodding, Lvs linear subulate channelled smooth
4695 Inner sepals glandular at end inflexed, Peduncles spreading at right angles, Lvs lanc lin. obliquely bent
4696 Inner sepals glandular at end infl. Scape erect wavy, Fl cernuous, Lvs lin subul chann. outside hairy
4697 Inner sepals vaulted at end, Leaves smooth, Peduncles the length of bractes

§ 2 *Six stamens fertile*

4698 Inner sepals vaulted at end, Leaves lin flattish, Scape shorter than leaves, Pedunc very long spreading
4699 Inner sepals glandular at end inflexed, Leaves lin lanc convol upright shorter than scape
4700 Inner sepals glandular at end reflexed, Leaves lin lanc. flattish, Pedunc at right angles, Flowers erect
4701 Scape shorter than leaves few-flowered, Flowers nodding, Filam 2-toothed
4702 Leaves lanceolate, Raceme pyramidal before the leaves, Filam glandular at base
4703 Leaves lin subulate channelled, Scape simple shorter than leaves, Scales of root wrinkled across
4704 Inner sepals glandular at end inflexed, Lvs lin lanc flat, Pedunc very long erect spreading, Fl upright
4705 Inner sepals vaulted at end, Leaves lin lanceol channelled upright, Pedunc. shorter than nodding flow
4706 Inner sepals vaulted at end, Leaves lin lanc channelled, Pedunc. spreading the length of nodding flow
4707 Inner sepals vaulted at end, Lvs lin subul chann hairy clammy, Ped spread twice as long as nodd. fl.
4708 Inner sepals vaulted at end, Leaves lin subulate convolute at the end spirally twisted villous

4709 Stem very short, Leaves 2-edged lengthwise, Scape very long higher than the spike
4710 Stemless, Leaves 3 cornered flat in front beyond the middle hollowed, Scape very long higher than spike
4711 Stemless, Leaves 3 cornered below the middle in front little raised above middle concave, Bracts very long

4712 Roots fibrous, Stems branched diffuse rounded striated, Branches somewhat angular, Anthers unequal
4713 Bulbs fascicled, Leaves radical channelled nearly as long as the rounded simple stem

4714 Leaves roundish acuminate cucullate at base
4715 Leaf sub-cordate acute cucullate pubescent
4716 Leaves ovate lanceolate at the edge wavy involute
4717 Leaves elliptical obtuse flat
4718 Leaf proliferous, Leaflets filiform undivided sessile

4719 Radical leaf linear flat, Peduncles simple umbellate, Sepals obtuse smooth, Bulbs clustered
4720 Radical leaf linear lanc flat, Pedunc simple somewhat umbellate, Sepals obtuse smooth, Bulb solitary
4721 Leaves linear filiform upright, Pedunc about 3 with a three-leaved involucrum
4722 Scape angular naked, Pedunc umbellate branched pubescent, Sepals lanc acute
4723 Scape naked, Pedunc 3 umbell pubescent, Leaves filiform, Three outer sepals longer than the others
4724 Leaves half cylindrical, Cauline dilated at base

4725 Scape 2-leaved, Leaves opp Pedunc 1-fl Outer sepals lanc retuse inner ellipt twice as broad
4726 Scape naked, Flowers umbelled, Filam all 2-forked bearing the anther in the middle
4727 Raceme few-flowered, Sepals lanceolate, Leaves filiform channelled, Filam subulate
4728 Corymb few-flowered, Pedunc longer than bractes, Filam subulate
4729 Raceme spiked many-fl Lvs lin lanc weak, Every other stamen with two teeth, Bractes longer than fl.
4730 Raceme oblong, Filam lanceolate membranous, Pedunc and fl spreading
4731 Corymb few-flowered shorter than lanceolate strongly fringed leaves
4732 Raceme very long, Sepals linear obtuse, Filam lanceol equal, Style the length of stamens
4733 Raceme very long, Sepals lanc oblong, Filam broad lanceol alternately shorter
4734 Raceme long, Filam subulate alternate lanceolate, Bractes membranous ovate twice as long as pedunc
4735 Raceme few-flowered, Sepals linear oblong obliquely bent emarginate, Filam lanc subul Leaves linear
4736 Leaves short oblong erect, Scape very long, Flowers campanulate the length of stamens
4737 Raceme very long, Filam subulate, Pedunc much longer than flower, Leaves lanceolate
4738 Raceme very long, Filam subul Pedunc length of fl Bractes the length of pedunc Lvs lin lanc loose
4739 Lvs glaucous twisted upwards, Raceme divaricating on a long scape, Filaments with an ovate base
4740 Raceme very short, Bractes lanc the length of flowers, Sepals obtuse, Filam subulate
4741 Raceme conical, Fl numerous ascending, Sepals oblong flat, Stam lanc equal, Style very short

and Miscellaneous Particulars

802 *Ornithogalum* From ὄρνις, a bird, and γάλα, milk. No good explanation has been offered of the application of this word, that of Tournefort is not worth quoting. O. squilla is the officinal squill. It has a bulb almost as big as the human head, pear-shaped, and tunicate like the onion. From the middle of the root arise several shining leaves a foot long, and two inches broad at their base, lessening all the way to the top, where they end in points They continue green all the winter, and decay in the spring, then the flower-stalk comes out, rising two feet high, naked about half way, and terminated by a pyramidal thyrse of white flowers

The squill is one of the few medicines known in the early ages of Greece, which is still held in great estimation It is very nauseous, intensely bitter and acrimonious, without any perceptible smell It is poisonous to several animals if much handled it exulcerates the skin, and in large doses frequently repeated, it not only excites nausea, but strangury, bloody urine, and hæmorrhoids, with fatal inflammation and gangrene of the stomach and bowels. Under proper management, however, it is a medicine of great practical utility. In

History, Use, Propagation, Culture,

dropsy it has long been esteemed the most certain and effectual diuretic with which we are acquainted, and it is usually employed in asthma

803 *Scilla* From σκυλλω, to injure, according to Miller, because its root is a violent poison as well as an article of medicine In Arabic it is called *asgyl*, has not the name *scilla* been obtained rather from this root? The genus is so ill defined that botanists are more guided by their blue colour than by any precise mark, in referring plants to this rather than Ornithogalum

S peruviana or hyacinth of Peru is erroneously named, being a native of Spain It is valuable as an evergreen, or rather wintergreen, its fine lucid green leaves appearing before winter and continuing through that season, till it sends up its thick succulent scapes about the end of April There are two varieties, one with a deep blue, and the other with a white flower Like other Spanish bulbs it is liable to be destroyed by an extraordinary severe winter

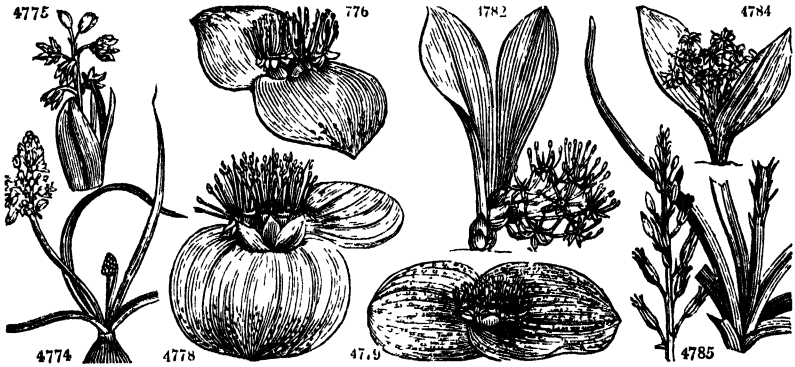
S. verna is a maritime plant found on the coast of Cornwall, Wales, the Isle of Man, and the Hebrides.

S non-scripta is the Hyacinthus of that name of Linnæus, the *Jacinte des bois*, of the French, and *Nederlandische* or *Englische Hyacinthe*, of the Germans The fanciful specific name of non-scriptus was

4742 Raceme long, Filam subul Sepals lanc at the end callous inflexed, Leaves linear depressed flat
4743 Raceme few-fl Filam subulate, Sepals lin obtuse 3 outer bearded at end, inn mucron Leaves filiform
4744 Raceme long many-fl. Filam. subulate, Sepals lanc. acute, Leaves filiform subulate
4745 Leaves filiform fleshy, Scape few-flowered
4746 Corymb many-flowered, Filam. subulate, Cor broadly campan Outer sepals obsoletely 3-toothed
4747 Corymbs many-fl racemose, Filam alternately forked, Leaves lanceolate
4748 Raceme contracted corymbose, Filam alternately emarg Leaves lanc with cartilaginous teeth
4749 Like the last, but the flowers very yellow, and the bractes very narrow the length of the flower-stalk
4750 Raceme many-fl contracted, Altern filam emarginate, Leaves linear channelled
4751 Raceme very long, Leaves lanc linear, Flowers spreading, Stam dilated alternately wedge-shaped
4752 Leaf solitary longer than scape, Flowers few spiked sessile
4753 Flowers without the leaves, Bractes reflexed

4754 Raceme conical oblong
4755 Corymb clustered conical
4756 Raceme oblong conical, Sepals lined
4757 Raceme few-flowered, Peduncles without bracteæ, Leaves lanceol lying on the ground
4758 Scape angular, Peduncles alternate shorter than flower, Bractes obtuse very short
4759 Four-leaved, Scapes many half-rounded striated 2-flowered decumbent after flowering
4760 Scape angular, Raceme corymbose, Peduncles twice as long as fl Bractes obsolete
4761 Raceme few-flowered with bractes, Flowers campanulate, Leaves linear channelled radical many
4762 Leaf roundish somewhat spiked on one side
4763 Raceme cylindrical many-flowered, Sepals half as long again as the ovaries, Peduncles colored
4764 Leaves filiform linear, Flowers corymbose, Peduncles naked ascending the length of the flower
4765 Flowers racemose, Leaves lanceolate linear about two elevated on a scape
4766 Scape rounded, Corymb few-flowered umbelled, Bractes filiform the length of peduncles
4767 Flowers campanulate 6-parted, Raceme cernuous
4768 A species which has not yet been seen in flower, nor described
4769 Raceme many-fl obl conical, Flowers campan erect, Bractes 2-parted longer than pedunc. Lvs. lanceol.
4770 Flowers campanulate 6-parted revolute at end

4771 Flowers 6-parted, Raceme cernuous, Leaves shorter than scape
4772 Flowers funnel-shaped corymbose erect, Scape shorter than the leaves
4773 Scape longer than keeled linear leaves, Spike racemose, Five sepals ascending, the lower deflexed
4774 Flowers campanulate half six-cleft racemose, Stamens membranous



4775 The only species, like a pale-flowered variety of *Scilla sibirica*

4776 Leaves roundish smooth
4777 Leaves lanceolate oblong acuminated

4778 Leaves roundish smooth towards the end muricated
4779 Leaves roundish veiny warted rough

4780 Leaves ovate and lanceolate with hairy tubercles, Sepals filiform
4781 Leaves lanceolate and elliptical veinless warted, Warts naked, Sepals ovate
4782 Leaves oblong lanceolate flat smooth
4783 Leaves lanceolate wavy smooth
4784 Leaves lanceolate, Sepals much shorter than the tube, Filam capillary alternately longer

4785 Scape naked simple, Stamens twice as long as flower, Leaves linear channelled

and Miscellaneous Particulars

applied to this plant by Dodonæus, because it has not the marks of Ai, Ai, on the petals, as other hyacinths are supposed to have, and therefore is not the Hyacinthus poeticus This idea has its origin in the Roman mythology, in which Apollo, being much grieved for the death of the youth Hyacinthus, changed his blood into a flower which bore his name, &c It is a native of almost every part of Europe and of Persia

804 *Puschkinia* Named after Count Mussin Pouschkin, a Russian botanist and patron of botany A very remarkable little plant, resembling a Scilla in appearance, but well defined by the very curious union of its stamens into a cup

805 *Massonia* So named by Thunberg, after Mr Francis Masson, author of Stapeliæ Novæ, a successful botanical collector at the Cape of Good Hope, Madeira, the West Indies, and finally North America, into whose wildernesses he went to die Very singular plants, with broad leaves lying flat on the ground, and compact umbels of flowers

806 *Eremurus* From ἐρημος, desert, and οὐρα, a tail tail of the desert. Its long spikes of yellow flowers may be easily imagined to merit such an appellation in their native abodes

History, Use, Propagation, Culture,

807 *Bulbine* From βολβος, a bulb The species are deservedly common in flower gardens, being at once shewy, fragrant, of easy culture, and rapid increase by suckers

808 *Asphodelus* From α, privative, and σφαλλω, to supplant that is to say, a flower which cannot be supplanted or surpassed *Linn* The yellow and white species are old inhabitants of our gardens, of easy culture and rapid increase Immense tracts of land in Apulia are covered with the latter species, which affords very good nourishment to the sheep It was sacred to Proserpine, and used in funeral ceremonies

809 *Anthericum* A name applied by the Greeks to the stem of the asphodel, and not misapplied to this set of plants, which in some sort resemble the asphodel Plants with fleshy leaves, and spikes of bright yellow flowers, easily cultivated if kept dry

4786 Leaves fleshy rounded, Stem shrubby erect branched
4787 Leaves fleshy rounded glaucous, Stem shrubby short rooting
4788 Leaves fleshy tongue-shaped lanceolate flat on both sides
4789 Leaves fleshy linear acuminate channelled, Scape twice as long as leaves
4790 Leaves fleshy subulate half rounded flexuose glaucous 3 times as short as scape
4791 Leaves fleshy subulate rounded, Scape racemose
4792 Leaves ensiform fleshy 3 cornered fringed, Scape simple, Raceme very long

4793 Stem leafy, Leaves 3 cornered striated
4794 Stem leafy, Lvs subul 3 cornered striated, Bractes membranous lanceol. : the upper longer than flowers
4795 Stem naked branched, Pedunc. altern. longer than bract, Leaves ensiform carinate smooth
4796 Stem naked simple, Pedunc clustered the length of bractes, Leaves linear keeled smooth
4797 Stem naked, Leaves upright striated subulate fistular
4798 Leaves linear weak, Scape erect branched, Flowers small
4799 Stem leafy naked above branched, Leaves filiform striated toothed ciliated
4800 Stem nearly naked, Leaves upright cylindrical fistular

4801 Leaves fleshy lanceolate flat concave at base reflexed at end, Raceme nodding at end
4802 Leaves fleshy oblong lanceolate acuminate nerved straight 4 times as short as scape
4803 Leaves flattish, Scape 1-flowered
4804 Leaves flat, Scape branched, Flowers flat, Pistils straight
4805 Leaves linear keeled shorter than the branched scape, Flowers clustered in threes pendulous
4806 Leaves linear channelled smooth cartilaginous at edge, Scape simple
4807 Leaves lanc linear channelled with an obtuse concave end, Scape and raceme simple, Flowers spreading
4808 Raceme simple long many-flowered, Pedunc spreading in flower, appressed in fruit
4809 Roots fibrous, Filaments declinate the outer not bearded
4810 Leaves filiform flexuose reflexed longer than scape, Scape simple filiform, Raceme few-flowered
4811 Leaves flaccid glaucous with the edge and nerves rough, Stem panicled branched, Filam not bearded

4812 Leaves oblong, Raceme corymbose, Stamens dilated in middle papillose
4813 Leaves fleshy linear-subulate half-rounded upright
4814 Leaves fleshy compressed hispid
4815 Leaves rounded filiform upright shorter than scape, Scape simple
4816 Leaves linear filiform flexuose reflexed at base ciliated the length of the branched scape
4817 Leaves filiform rounded roughish, Filaments smooth, Sepals lanceolate
4818 Leaves flat smooth linear lanceolate acute, Scape simple, Raceme many-flowered cylindrical compact
4819 Leaves 3-cornered rough, Scape branched, Flowers revolute
4820 Leaves linear ensiform keeled 3-cornered shorter than the branched scape
4821 Leaves linear flat depressed shorter than the branched scape, Alternate sepals wavy
4822 Leaves channelled sword-shaped, Scape simple, Bractes remote 3-flowered
4823 Leaves fleshy hairy sword-shaped 3-cornered channelled on the narrow side, Scape simple
4824 Leaves flat, Scape simple, Flowers flat, Pistil declinate
4825 Leaves flat, Scape simple, Flowers campanulate, Stamens declinate

4826 Racemes divided, Pedicels clustered, Inner sepals crenulate, Capsules pendulous
4827 Raceme divided, Bractes leafy, The bearded half of filam with 2 appendages at base, Lvs lanc ensiform

4828 Stemless, Leaves lanceolate radical little longer than simple scapes
4829 Leaves flat, Scape branched, Peduncles clustered, Flower flat

4830 Lvs lanceol. acuminate upright spreading, Panicle branched upright many-flowered, Branches smooth

4831 Flowers nodding, Stamens propendent, Filaments striped, Leaves flat, Bulbs clustered

4832 Leaves ensiform, Filaments woolly
4833 Bractes unequal the lower embracing the stalk, the upper setaceous

and Miscellaneous Particulars

810 *Arthropodium.* From ἀρθρον, a joint, and πους, a foot, on account of the jointed footstalks of the flowers. Distinguished by its bearded filaments.

811 *Chlorophytum* From χλωρος, green, and φυτον, a plant. Very inconspicuous flowers requiring a bark-bed, but easily cultivated under such circumstances.

812 *Caesia* Named after Frederick Cæsius, who lived in 1703

813 *Narthecium* From ναρθηξ, a rod or wand, in allusion to the slender spike of flowers This genus resembles a small Anthericum, from which genus it has been separated.

History, Use, Propagation, Culture,

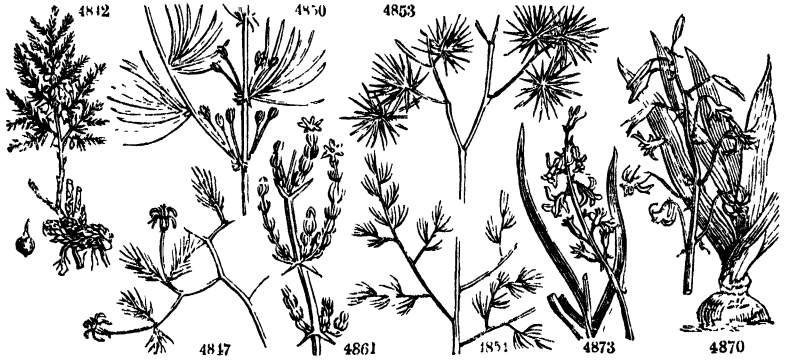
814 *Dianella* A diminution of *Diana*, the name which the genus originally received from Commerson The species are found in the recesses of forests, where the goddess of hunting may be supposed to inhabit

815 *Eustrephus* From *ευ*, well, and *στρεφω*, to turn, in allusion to the twining habit of the species

816 *Asparagus* From *σπαραασσω*, to tear, on account of the strong prickles with which some of the species are armed Some are dioecious, and others are prickly evergreen climbers A officinalis, *Asperge*, Fr, *Spargel*, Ger, and *Isparago*, Ital, is one of the oldest and most delicate of culinary vegetables It is found on the sea-shores in different parts of Britain and in many parts of Europe, and is abundant in the inland sandy plains in Russia, Turkey, and Greece Asparagus was in much esteem both among the Greeks and Romans It is much praised by Cato and Columella, and Pliny mentions a sort which grew near Ravenna, a deep sandy country, three shoots of which would weigh a pound. It is equally admired by the moderns, and assiduously cultivated in private gardens everywhere, and to a great extent round London, Paris, and Vienna In no part of the world is it grown to such perfection as in the market gardens round London That of the parish of Mortlake is particularly strong and succulent the soil is a sandy loam, deeply trenched, and well manured, the seed is sown in drills and thinned out till the plants stand six inches apart in the row, and the rows are a foot asunder Round Paris and Vienna more pains are taken in preparing the soil, by forming excavations and filling them with layers of turf, durable manure, as bones, wood-chips, &c, sand, manure, loam, &c., but though plantations on such beds last longer than on our's, they do not yield better shoots, and it may justly be questioned whether they are equally profitable to the cultivator

The culinary preparations of asparagus are few, its very delicate flavor rather being deteriorated than improved by powerful tastes It is best boiled and served alone, to be eaten with butter and salt, or with the points of the shoots cut in small pieces, and served up as green pease It is esteemed diuretic, and in Paris

4834 Radical leaves sword-shaped flat shorter than the stem with the keel and edges smooth, Panicle simple
4835 Radical leaves ensiform long smooth at the edge and keel, Panicle upright
4836 Leaves bright-green smooth, Panicle lax decomp Sepals of pendulous flower reflexed, Fllam. strumous
4837 Leaves linear-lanceolate at the edge prickly, Keel smooth



4838 Stem leaves numerous long ensiform rough at the edge and keel, Branches of panicle short
4839 Leaves radical lin -lanceolate at the keel and edges smooth, Panicle decompound straggling

4840 Leaves ovate or elliptical-lanceolate, Anthers after flowering twisted
4841 Leaves linear or linear-lanceolate, Anthers after flowering straight

4842 Stem herbaceous round erect, Leaves setaceous
4843 Stem herbaceous erect rounded, Leaves setaceous ½-whorled and whorled, Stipules solitary unarmed
4844 Stem half-climbing, Branches straggling, Leaves setaceous curved, Flowers globose
4845 Stem unarmed rounded, Branches declinate, Leaves setaceous
4846 Stem much branched wavy, Leaves setaceous pungent, Flowers campanulate
4847 Stem herbaceous unarmed decumbent much branched, Branches wavy, Leaves setaceous
4848 Herbaceous unarmed twining, Leaves lanceolate falcate
4849 Stem herbaceous erect, Branches straight, Leaves bundled setaceous long, Peduncle nodding
4850 Prickly solitary recurved, Branches round, Leaves fascicled linear falcate, Peduncle 1-fl clustered
4851 Prickles solitary, Branches striated, Leaves bundled linear-subulate falcate, Racemes many-fl axillary
4852 Branches striated, Leaves linear falcate unequal, Flowers few
4853 Prickles solitary, Branches round reflexed bent back, Leaves setaceous bundled
4854 Prickles solitary, Stem erect, Branches filiform, Leaves bundled setaceous
4855 Prickles solitary reversed, Branches angular, Leaves lanceolate linear
4856 Prickles solitary, Branches angular wavy, Leaves bundled 3-cornered blunt deciduous
4857 Stem unarmed angular shrubby, Leaves needle-like rigid perennial mucronate equal
4858 Herbaceous unarmed, Branches wavy, Leaves lanceolate
4859 Stem unarmed angular shrubby, Leaves subulate striated unequal diverging
4860 Unarmed, Branches bent back, Leaves rounded subulate
4861 Spines 4, Branches clustered rounded, Leaves setaceous
4862 Leaves solitary linear lanceolate, Stem wavy, Prickles recurved

4863 Leaves oval sub-erect plain, Raceme long cylindrical, Bractes hooked back upon themselves
4864 Leaves linear lanc obliquely bent smooth, Flowers nodding
4865 Leaves linear keeled ciliated
4866 Leaves lanceolate smooth channelled at base, Flowers erect
4867 Leaves wedge-shaped smooth, Scape few flowered
4868 Leaves lanceolate smooth wavy, Peduncles horizontal
4869 Leaves linear lanceolate half-round

4870 Leaves broad lanceolate erect much shorter than scape, Peduncles very long
4871 An undescribed species, said to be in the gardens about London
4872 Leaves bright green channelled striated, Sepals oval the length of stamens
4873 Leaves glaucous, Raceme lax, Sepals linear much spreading longer than stam

and Miscellaneous Particulars.

is much resorted to by the sedentary operative classes, as taylors, weavers, &c when they are troubled with symptoms of gravel or stone

There are some varieties and subvarieties of asparagus, but excepting the red-topped and green-topped, the others are merely local varieties, and can hardly be said to be obtainable by seed

In the kitchen garden asparagus is generally grown in beds four feet broad, and in rows a foot or eighteen inches apart by nine inches in the row The plants are either raised from seed where they are to remain, or raised on a seed bed the preceding year and transplanted The value of the crop depends on the soil being dry, sandy, trenched two and a half or three feet deep, and powerfully manured During winter the beds are covered with dung or litter to protect them from the frost In spring this is raked off into the alleys and dug in, while the beds are stirred with a fork, to admit the air, heat, rain, &c to stimulate the rising shoots Asparagus from seed will be fit to cut the third year, in perfection the fifth, and will continue good for ten or twelve years The season for cutting is from the middle of April to the middle of June

Asparagus is extensively forced, generally by taking up the roots and placing them on dung or tan beds; but sometimes a more gentle forcing is given by covering the beds with dung in the manner of forcing sea-cale. By the former mode earlier crops are obtained, but the roots are lost, by the latter, the crop is only forwarded a week or two, but the roots remain to produce the following year

817 *Drimia* So called from the Greek word δριμυς, caustic, because the juice of the roots is so very acrid, as, when applied to the skin, to cause inflammation and even blisters

818 *Uropetalon* From ουρα, a tail, and πεταλον, a petal, in allusion to the manner in which the divisions of the flower are lengthened out. Curious and rare bulbous plants, very nearly related to Zuccagnia, perhaps not generically distinct.

History, Use, Propagation, Culture,

819 *Hyacinthus* Every one knows the fable of Hyacinthus, who was killed by Apollo and changed to this flower Bochart, however, remarking that the ancients applied the name to a red flower, concludes that the Arabic *yâgdut*, which signifies red, has something to do with the name. A conjecture certainly sufficiently learned, but less plausible

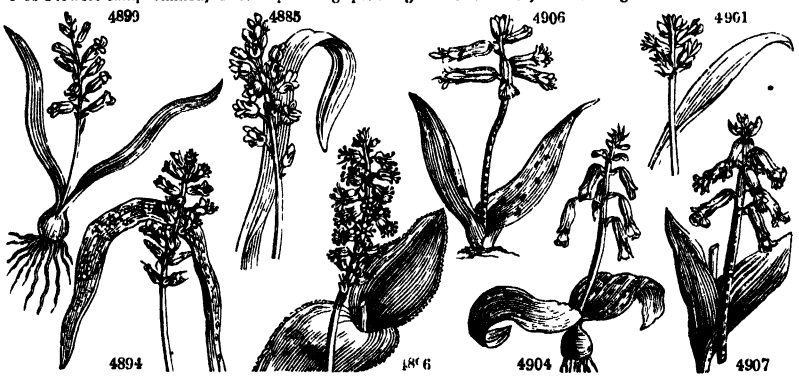
H orientalis is the origin of one of our finest florist's flowers, and, like the tulip and narcissus, of a considerable commerce to the Dutch It is a native of the East, and abundant about Aleppo and Bagdat, where it flowersin February It seems to have been first cultivated as a flower by the Dutch, but when is unknown. Most probably in the beginning of the sixteenth century, soon after the revival of commerce in the west of Europe, when the merchants of Holland traded to the eastern shores of the Mediterranean and the Archipelago About the end of the sixteenth century there were seven or eight varieties known in England In 1620, Swertius, in his Florilegium, figured forty varieties, Miller says the Haarlem florists in his time (say 1720) had above 2000 varieties, and though the passion for this flower has greatly declined, they have still upwards of half that number. In England three or four hundred sorts are annually imported from the Dutch florists by the seedsmen

A fine double hyacinth is characterized by strength and enlargement of all the parts, and by bright distinct colors The fundamental varieties are double, semidouble, single, red, white, purple, blue, and yellow, in many different shades and variegations A variety degenerates in a few years; but some have existed undeteriorated upwards of a century Varieties are raised from seed, and flower the fourth or fifth year: their names are after the growers or their patrons, favorite friends, public characters, or the celebrated names of history and antiquity

The seeds of the hyacinth are sown in October, after they have ripened, or in the following March They remain three years with no other culture than covering with a little earth in autumn, but the fourth season they are transplanted into beds, where they remain two or three years longer till all the bulbs have flowered

The soil is essentially a very sandy loam and vegetable mould, and if in forming the beds this soil can be made to the depth of two feet, and at the bottom of the bed a layer of six or nine inches of cow-dung

4874 Flowers campanulate half 6-cleft cylindrical at base
4875 Flowers funnel-shaped half 6-cleft ventricose at base



4876 Leaves linear channelled longer than scape

4877 Flowers cylindrical ovate uniform horizontal subsessile

4878 Flowers camp cylindrical half 6-cleft, Pedunc in fruit very long and horizontal
4879 Flowers cylindrical angular on long stalks, the upper sterile on very long stalks

4880 Flowers campan cylindrical, Limb erect shorter than tube, Leaves lin lanc erect
4881 Flowers globose uniform the lower remote, Leaves linear upright channelled
4882 Flowers ovate uniform clustered . the upper sessile, Leaves lax dependent linear

4883 Flowers campanulate sessile, Inner sepals longer spreading obtuse, Leaves lin lanc smooth
4884 Flowers campanulate sessile, Inner sepals longer spreading obtuse, Lvs obl lanc with cartila cren edge
4885 Flowers campanulate sessile, Inner sepals longer spreading obt. Scape ang at end short than lin obl lvs
4886 Fl campanulate sessile, Inner sepals longer spreading emarg Lvs lin chann lax twice as long as scape
4887 Fl campan. sessile, Inner sepals longer spreading obov obt Lvs lin channelled lax longer than scape
4888 Fl camp cylind. on short stalks erect, Inner sep long lanc obt erect, Lvs lin chann lax long than scape
4889 Flowers camp stalked, Inner sepals longer obovate spreading, Lvs lanc channelled shorter than scape
4890 Fl camp stalked horizontal, Inner sep longer obt Stam longer than fl Lvs lanc twice as short as scape
4891 Leaves two, Scape not longer than leaves, Fl short horizontal, Stamens long declinate
4892 Leaves two oblong, Raceme compact, Flowers short campanulate nearly as long as stamens
4893 Leaves three lanceolate blistered shorter than scape, Flowers campanulate erect
4894 Flowers camp on short stalks, Inner sep long obtuse, Scape 3 cornered reclinate, Leaves blistered
4895 Fl camp stalked, Inner sep long obt. revol Stam longer than fl Scape angular at end, Leaves blistered
4896 Leaves two oval-edged, Flower erect conical shorter than spreading stamens
4897 Fl camp flat at base length of stalk, Inner sep long. obt Stam longer than fl Scape ang at end, Lvs obl.
4898 Leaves lanceolate erect unequal the larger cucullate at base, Scape few-flowered shorter than leaves
4899 Lvs lin lanc two-spreading, Flowers whole-colored with the outer sepals nearly as long as the inner
4900 Flowers cylindrical length of stalks, Inner sepals longer obtuse unequal, Leaf one lin lanceol
4901 Lvs two lin lanc spreading, Fl erect sessile clust ovate with inner sep much the narrowest and longest
4902 Flowers cylind. stalked, Sepals linear obtuse equal, Scape angular at end, Leaves lanc deflexed
4903 Flowers cylind stalked pendulous, Inner sepals longer emarginate, Leaves lanceolate
4904 Flowers cylind stalked pendulous, Inner sepals longer emarginate spreading, Leaves obl spreading
4905 Leaves twin obl not spotted, Scape erect not spotted, Flowers cylindrical pendulous
4906 Flowers cylind on short stalks pendulous, Inner sepals longest, Leaves oblong
4907 Leaves twin lin lanc spotted, Scape erect, Flowers pendulous with the inner limb of sepals spreading
4908 Flowers camp stalked, Outer sepals long spreading inner connate, Leaves long channelled

and Miscellaneous Particulars

deposited, the plants will thrive the better The season of planting is from the middle of October to the middle of November The bed should be protected from heavy rains and severe frosts by the usual means, and about the beginning of April, when the flowers begin to open, an awning of canvass should be fixed over them, to exclude all extremes of weather, and the more brilliant moments of sunshine In three weeks or a month after blooming the bulbs should be taken up, unless they are intended to remain for seed They should be dried in the shade, or under a few inches of dry earth, kept dry, and afterwards cleaned and wrapped up in separate papers, or laid on open airy shelves till wanted for replanting

The hyacinth forces well, especially some of the blue sorts, it also does better than most bulbs when planted on water

820. *Zuccagnia* This plant was named in honor of Attili Zuccagni, superintendant of the garden at Florence. It is scarcely a different genus from Uropetalon.

821. *Muscari* Something which smells of musk, called μοσχος in Greek, *muscus* in Latin, *misk* in Arabic (*Forskahl.*) M. comosum, β monstrosum, is a most ornamental border flower The bulb is large, ovate, and solid: the leaves narrow, a foot long, with obtuse points the flower-stalks rise near a foot and a half high, they are naked at the bottom for about seven or eight inches, above which the panicles of flowers begin, and terminate the stalks. The flowers stand upon pedunclcs which are more than an inch long, each sustaining three, four, or five flowers, whose petals are cut into slender filaments like hairs, they are of a purplish blue color, and, having neither stamina nor germ, never produce seeds. The other species are very pretty hardy flowers

M racemosum was named starch hyacinth by William Curtis, from the smell of the flower.

822 *Lachenalia.* So named in honor of Wernerus de la Chenal, of Switzerland, author of some medical and botanical tracts printed at Basle. The numerous species of this genus were chiefly introduced from the Cape by Masson: they bear a strong general resemblance, and are yet individually different, they may be styled diminutive, but pretty, they grow readily in sand and peat, and may be forced or retarded so as to flower at almost any season. They must be very sparingly watered when not in a growing state

History, Use, Propagation, Culture.

823 *Phormium* From φορμος, a basket This plant sends up numerous leaves, which in New Zealand and Norfolk Island are manufactured into matting, or a coarse thread is separated from them and made into cordage and coarse linen, as is done from different species of Aloe, Agave, and Liliaceæ in the Levant and south of Europe The plant thrives in any rich light soil, increases readily by offsets, and is said to stand the open air about Cork, where thoughts are entertained of using it as a substitute for flax The experiments, however, which have been made in New Holland by some spirited individuals respecting its cultivation, have all failed.

824 *Cyanella* Derived from κυανος, blue, in allusion to the color of the flowers of some species; all are very pretty and easily cultivated

825 *Leontice* An abridgment of *Leontopetalum*, its ancient name, from λεων, a lion, and πετηλον, a leaf, because the shape of the leaves was thought to resemble the print of a lion's foot.

826. *Caulophyllum* From καυλον, a stem, and φυλλον, a leaf Its leaves are so terminated by the stalk, as to appear a mere continuation of a stem

827. *Diphylleia* From δις, two, and φυλλον, a leaf The plant has never more than two leaves

828. *Prinos.* This was the Greek name of the evergreen oak, from πριω, to saw, on account of the strongly toothed leaves of that plant. The species are low shrubs of little beauty, but of the easiest culture in any light soil

829 *Berberis. Berbérys*, according to Golius, (p 246), is the Arabic name of this plant. B vulgaris is at once an ornamental shrub, a fruit tree, a hedge plant, a dye, a drug, and a reputed enemy to the corn farmer When covered with flowers in spring, or with fruit in autumn, it is a fine object. The leaves are of a yellowish or bluish green, and gratefully acid to the taste The smell of the flowers is offensive when near, but pleasant at a certain distance. The berries are so very acid, that birds seldom touch them The berberry, however, is cultivated for the sake of these, which are pickled and used for garnishing dishes; and being boiled with sugar, form a most agreeable rob or jelly, they are used likewise as a sweetmeat, and are put into sugar-plums or comfits. As a medicine the fruit is considered a mild restringent acid, agreeable to the stomach, and of efficacy (like other vegetable acids) in hot bilious disorders, and in a putrid disposition of the humours. The roots boiled in a lye yield a yellow colour and in Poland they dye leather of a fine yellow

4909 The only species, resembling an *Agave*

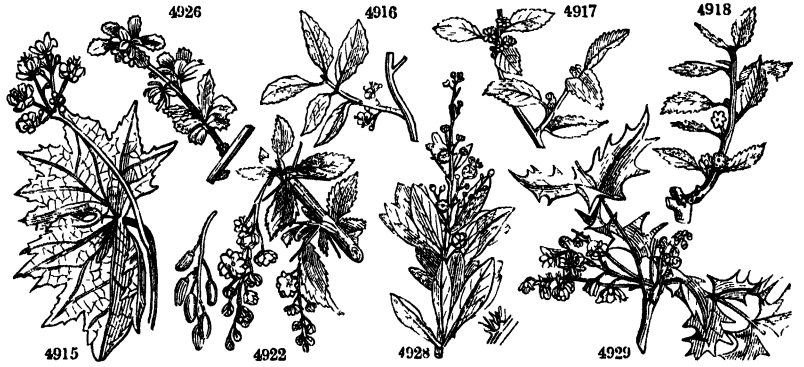
4910 Stem leafy panicled, Racemes divaricating, Leaves lanceolate wavy
4911 Scape naked branched, Racemes erect, Leaves linear lanceolate flat

4912 Leaves pinnated, Leaflets whorled lanceolate acute 3-pointed
4913 Radical leaves biternate, cauline ternate, Fruit ovate

4914 Cauline leaf triternate, floral biternate

4915 Quite smooth, Leaves palmate angular lobed serrated with taper-pointed lobes

4916 Leaves obovate lanceolate acuminate doubly serrated, Veins beneath hairy
4917 Leaves oval pointed at each end mucronate serrulate pubescent beneath, Female flowers solitary
4918 Leaves lanceol serrated acuminate smooth on each side, Flowers all 6-cleft
4919 Leaves lanceol very finely and distantly serrated acute at each end quite smooth, Male flow. 3-androus
4920 Leaves lanceol obt smooth serrated at end
4921 Leaves elliptical acuminate smooth somewhat serrated at end



4922 Racemes simple pendulous, Leaves obovate ciliate-toothed

4923 Branches dotted, Prickles in 3s, Lvs simple obovate remotely toothed, Racemes short, Fruit globular
4924 Spines 3-parted, Leaves oval with a few large spiny teeth, Ped short 4-fl Peduncles elongate corymbose
4925 Spines 3-5-parted, Leaves oval-oblong entire or serrated, Racemes 3-8-flow almost shorter than leaves
4926 Spines 3-7-parted, Leaves lanceolate obovate ciliate-toothed, Peduncles 1-flowered shorter than leaf
4927 Spines 3-parted, Leaves lanceolate obovate ciliate serrate, Racemes pendulous, Petals emarginate
4928 Spines 3-parted very few, Leaves obl obtuse entire or a little toothed, Racemes many-fl nodding
4929 Lvs pinnated in 4 or 5 pairs, Leaflets ovate lanceolate spreading toothed, Racemes erect much clustered
4930 Spines simple scarcely two-toothed at base, Lvs obl with 4 or 5 spiny teeth, Racemes spreading many-fl
4931 Spines 3-parted, Lvs ovate lanceolate smooth some entire some three-toothed, Pedicels solitary one-flow

4932 Leaves supra-decompound with lanc entire leaflets

4933 Leaves pinnate lanceolate emarginate

4934 Cor 6-cleft, Segments lanceolate revolute, Leaves ovate acute
4935 Cor 4-cleft, Segments ovate, Leaves obovate

and Miscellaneous Particulars

with the bark of the root The inner bark of the stems also will dye linen of a fine yellow, with the assistance of alum. Kine, sheep, and goats are said to eat it, horses and swine to refuse it. This species varies with red, purple, pale yellow, and stoneless fruit

Insects of various kinds are remarkably fond of the flowers of the barberry, and the Æcidium Berberidis, its particular inhabitant, is supposed to generate the dust which, carried from the bush by winds, and lighting on wheat and other growing corns, gives rise to the Puccinia, a minute fungus, which closes up the pores of the leaves, and appears like rust or mildew (*Sir J Banks on Blight, &c*) Many highly respectable authorities in Britain, on the continent, and in America, are in favor of and against this opinion Willdenow, Withering, and Dwight have stated various remarkable cases on good authority Sir J Banks and his draughtsman Bauer proved the fact of the mildew being a fungus

Linnæus observed, that when bees in search of honey touch the filaments, the anthers approximate to the stigma and explode the pollen Sir J. Smith ascertained that the same effect is produced by touching the inside of the filaments with a small bit of stick (*Phil Trans* vol lxxviii 1 158)

All the other species are much esteemed as ornamental plants B aristata is a fine hardy evergreen shrub. B. ilicifolia and emarginata are also hardy, but less ornamental. B fascicularis is a beautiful ornamental nearly hardy shrub, remarkable for its pinnated leaves

830. *Nandina* *Nandin* is the name of this shrub in Japan, where it is a garden shrub the flowers are in panicles, and succeeded by berries of the size of a pea. In the greenhouse it grows freely in loam and peat, and ripened cuttings, with their leaves on, root in sand under a hand-glass

831. *Cossigna* Named by Commerson, after M. de Cossigny, a French naturalist, then living at Pondicherry Fine plants with handsome pinnated leaves

832 *Hillia.* So named by Jacquin, in honor of Sir John Hill, author of many large works on botany and other parts of natural history, as well as general literature Owing to some differences with his contemporaries, and writing against the Royal Society, after being rejected as a fellow, his memory in England has not met with much respect; in truth it was but little that it deserved. The species are of easy culture, and cuttings root readily in sand.

History, &c., Propagation, Culture,

833 *Richardia* So named by Houston, after Richard Richardson, an English botanist. Cuttings root in sand under a glass

834 *Canarina* That is to say, a plant native of the Canaries This plant, Sweet observes, "is very desirable, as it flowers in autumn and winter, when few other plants are in bloom After flowering, the stem lies down, and the roots continue dormant all the summer, when they need but little water When they begin to grow they had better be placed in the stove, as they will not flower so abundantly in the greenhouse A light loamy soil suits them best, or a mixture of loam and peat, and they are readily increased by dividing the roots, or from cuttings planted in the same kind of soil under a hand-glass" (*Bot Cult* p 162)

835 *Frankenia* In honor of John Frankenius, professor of botany at Upsal, who first enumerated the plants of Sweden in Speculum Botanicum, 1638, and Speculum Botanicum Renovatum in 1659

836 *Peplis.* One of the Greek names of the Purslane The plant now so called resembles the Purslane in some points

837 *Oryza* From the Arabic word *Aruz*, the Greeks coined their word ὄρυζα, and the various modern nations of Europe their *rice, riz, reis,* &c. O sativa, the common rice, has the culm from one to six feet in length, annual, erect, simple, round, jointed Leaves subulate-linear, reflex, embracing, not fleshy Flowers in a terminating panicle Calycine leaflets lanceolate Valves of the corolla equal in length, the inner valve even, awnless, the outer twice as wide, four-grooved, hispid, awned Style single, two parted

O mutica, the dry or mountain rice, cultivated in Ceylon, Java, and of late in Hungary, has the culm three feet high, and more slender Fruit longish, with awns the longest of all. It is sown on mountains and in dry soils, rots with a long inundation, and perishes with sea water

The varieties of rice, as of other cultivated grain, are as numerous as the different soils, climates, and other physical circumstances, in which it is cultivated besides the dry rice, the chief sorts, by some considered species, are the O præcox, or early rice, and the O glutinosa, or clammy rice, both cultivated in irrigated lands

The native place of rice, like that of the other sorts of grain in common use, is unknown, it is cultivated in great abundance all over India, where the country will admit of being flooded, in the southern provinces of China, in Cochinchina, Cambodia, Siam, Japan, &c In Japan it is very white, and of the best quality It has also been introduced into cultivation in the southern kingdoms of Europe, Italy, Spain, the south of France, and within a few years into Hungary and Westphalia. In Carolina it has long been a staple commodity. Houghton's account of its introduction there is, that Ashby was encouraged to send a hundred pound bagfull of rice to that province, from which, in 1698, sixty tons were imported into England. Dalrymple says, that rice in Carolina is the result of a small bag of *paddy*, given as a present from Dubois, treasurer of the East India Company, to a Carolina trader A Dutch vessel also, from Madagascar, brought rice into the same province, and to this is attributed their having two kinds. (*Oriental Repertory*, 1)

In the hilly parts of Java, and in many of the Eastern islands, the mountain rice is planted upon the sides of hills, where no water but rain can come, it is, however, planted in the beginning of the rainy season, and reaped in the beginning of the dry season The natives call it *Paddy Gunung*, which signifies mountain rice It is entirely unknown in the western parts of India, but it is well known in Cochinchina, where it thrives in dry light soils, mostly on the sides of hills, not requiring more moisture than the usual rains and dews supply, neither of which are frequent at the season of its vegetation

There is a kind of hill rice which is hardy enough to grow on the edge of the Himalayan snows. It is almost to be expected, that this will, at some future time, prove an acquisition of value to the European cultivator.

Rice is extensively cultivated in the East Indies and China, and chiefly on low grounds near large rivers,

4936 The only species, Leaves lanceolate ovate rough

4937 The only species, Leaves stalked hastate toothed

4938 Flowers solitary, Petals repand obtuse, Leaves linear ciliated at base
4939 Flowers fascicled, Petals acute, Leaves linear ciliated at base
4940 Flowers fascicled, Petals repand obtuse, Leaves linear oblong hairy at base
4941 Flowers solitary, Petals subrepand, Leaves roundish ovate powdery beneath

4942 Flowers hexandrous axillary solitary, Flowers stalked rounded ovate

DIGYNIA.

4943 The only species

4944 Prickly
4945 Unarmed. Leaves wavy

and Miscellaneous Particulars.

which are liable to be annually inundated, and enriched by the deposition of mud According to Sir George Staunton's account, the Chinese obtain two crops of rice in a year from the same ground, and cultivate it in this way from generation to generation on the same soil, and without any other manure than the mud deposited by the water of the river used in overflowing it. After the waters of the inundation have withdrawn, a few days are allowed for the mud to get partially dry, then a small spot is enclosed by a bank of clay slightly ploughed and harrowed, and the grain, previously steeped in dung, diluted with animal water, is then sown very thickly on it. A thin sheet of water is immediately brought over it, either by a led stream, or the chain-pump Thus a seed-bed or nursery is prepared, and, in the meantime, the remainder of the tract is preparing for being planted When the plants are six or seven inches high, they are transplanted in furrows made by the plough, so as to stand about a foot apart every way, water is then brought over them, and kept on till the crop begins to ripen, when it is withheld, so that when harvest arrives the field is quite dry It is reaped with a sickle, threshed with a flail or the treading of cattle, and the husk taken off by beating it in a stone mortar, or passing it between two flat stones, as in a common meal mill. The first crop being cut in May, a second is immediately prepared for by burning the stubble, and this second crop ripens in October or November After removal, the stubble is ploughed in, which is the only vegetable manure such lands can be said to receive from man. In Japan, Ceylon, and Java, according to Thunberg, Davis, and Raffles, aquatic rice is cultivated nearly in the same manner Mountain-rice is grown much in the same way as our barley.

In Lombardy and Savoy rice is sown on rich lands, the sower often wading to the knees in water · one crop a year only is obtained, but four crops are often taken in succession In America a similar practice obtains.

In Westphalia, and some other parts of the south of Germany, rice has long been cultivated, there it is sown on lands that admit of irrigation, but the water is not admitted till the seed has germinated, and it is withdrawn, as in Italy, when the crop comes into flower From long culture in a comparatively cold country, the German rice has acquired a remarkable degree of hardiness and adaptation to the climate, a circumstance which has frequently been alluded to as an encouragement to the acclimating of exotics. It is found, Dr Walker remarks (*Essays on Nat. Hist*), that rice seeds direct from India will not ripen in Germany at all, and even that Italian or Spanish seeds are much less early and hardy than those ripened on the spot.

In Hungary rice has not been long cultivated the mountain sort has chiefly been tried, and that in the manner of our barley or summer-wheat

In England a crop of rice has been obtained near Windsor, on the banks of the Thames

In the stove, or in a hot-bed, rice may be grown in pots of rich soil placed in pans of water, and in August they may be set in the greenhouse, or under any glass roof open at the sides, and they will produce perfect grains

By far the best imported rice is that from Carolina it is larger and better tasted than that of India, which is small, meagre, and the grains frequently broken As an article of diet, rice has been extolled as superior almost to any other vegetable but, whatever it may be in warmer climates, where it is a common, and to many persons almost their only food, it does not appear so well calculated for European constitutions as the potatoe; for we find that the poor constantly reject the use of rice when potatoes are to be had; and whilst these can be obtained, we may venture to predict, that rice will always be considered in this country, rather as a dainty, to be eaten with sweet condiments, spices, fruit, &c than as ordinary food. (*Wellich's Family Cyclopædia.*)

838 *Atraphaxis.* A name given by the Greeks to the Atriplex of the Latins, derived from α, privative, and τραφω, to nourish, that is to say, a plant yielding no nourishment. Cuttings root freely in sand under a glass, but the plants are of neither beauty nor curiosity

History, Use, Propagation, Culture,

839. *Flagellaria.* From *flagellum*, a thong, in allusion to the length, toughness, and slenderness of its shoots.

840. *Scheuchzeria* So named by Linnæus, in memory of the two brothers, John James Scheuchzer, professor of mathematics at Zurich, author of Itinera Alpina, and John, professor of physic at Zurich, author of a famous Treatise on Grasses A curious little marsh plant.

841. *Triglochin.* From τρεις, three, and γλωχις, a point, in allusion to the three angles of the capsule All domestic cattle are fond of the hardy species, which afford an early bite on the sides of Highland mountains, and are greedily eaten where they occur in salt marshes.

842. *Lichtensteinia* Named after M Von Lichtenstein, a Prussian traveller at the Cape of Good Hope.

843. *Myrsiphyllum.* From μυρσινη, a myrtle, and φυλλον, a leaf, in allusion to the resemblance between the leaves of the species and those of myrtle

844. *Tofieldia.* Named by Hudson, after a Mr Tofield, a country gentleman living near Doncaster.

TRIGYNIA.

4946 A shrub with distichous branches, Leaves cirrhous at end

4947 A rushy aquatic plant

4948 Capsules 3-celled linear
4949 Capsules 3-celled smooth linear narrowed at end
4950 Capsules 6-celled ovate

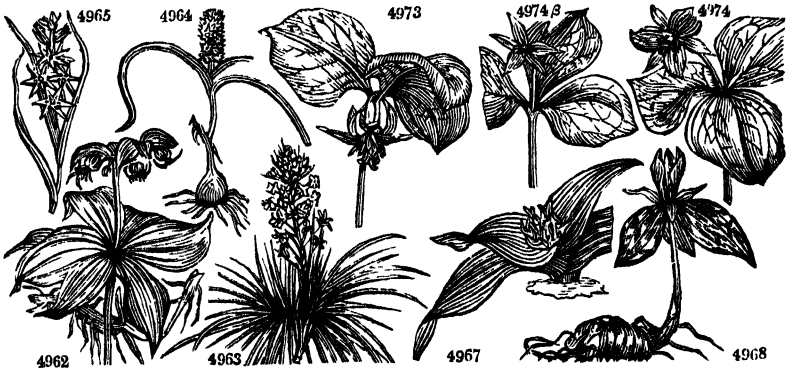
4951 The only species, Sepals very narrow

4952 Leaves ovate cordate at base oblique
4953 Leaves alternate ovate-lanceolate

4954 Smooth, Flowers clustered in spikes, Sepals obtuse, Capsules oblong
4955 Scape rachis and leaf-stalks downy all over

4956 Leaves lanceolate bearded at base, Stem 3-flowered, Sepals sessile
4957 Stemless, Leaves imbricated grassy, Flowers sessile
4958 Leaves linear subulate, the upper dilated at base, Spike wavy, Sepals with claws
4959 Leaves linear, Spike one-sided, Sepals with claws
4960 Leaves lin lanc longer than one-flowered stem, Sepals lanc. with claws
4961 Peduncles one-flowered cernuous

4962 Leaves whorled in the middle of stem, in threes at the summit



4963 Leaves of the stem setaceous

4964 Spike many-flowered longer than leaves, Tube twice as long as limb
4965 Leaves lanceolate channelled upright, Tube shorter than stellate limb
4966 Leaves lanceolate hooded

4967 Leaves oblong lanceolate cucullate

4968 Flower sessile erect, Petals lanceolate erect twice as long as calyx
4969 Flower sessile erect, Petals linear lanceolate erect a little longer than calyx
4970 Stalk of flower nearly erect, Petals oval-lanceolate acute recurved about twice as long as narrow calyx
4971 Stalk of flower erect, Petals oblong acute spreading a little longer than calyx
4972 Stalk of flower erect, Petals scarcely longer than calyx, Leaves oval oblong obtuse sessile
4973 Stalk of flower recurved, Petals lanceolate acuminate flat reflexed the length and breadth of calyx
4974 Stalk of flower inclining, Flower nodding, Petals scarcely longer but much broader than calyx

4975 Flower pendulous, Petals ovate with a short point, Leaves rounded rhomboid acuminate subsessile
4976 Flower cernuous, Petals spatulate-lanceolate erect at base much longer than calyx

and Miscellaneous Particulars.

845 *Melanthium.* A name applied by the Greeks to the Nigella of the Latins What resemblance the modern plant bears to the ancient has not been stated

846 *Medeola* A name in remembrance of Medea, the famous sorceress, given to this plant on account of supposed powerful effects in medicine, but which it is now thought not to possess

847 *Xerophyllum.* From ξηρος, dry, and φυλλον, a leaf: its leaves appear as if withered An American plant with a long spike of white flowers, resembling Helonias

848 *Wurmbea* So called by Thunberg, in gratitude for services rendered him at Batavia by one Wurmb, a Dutch agent there Jussieu considers this not generically distinct from Melanthium

849 *Androcymbium* From ανηρ ανδρος, a man, or, in botanical language, a stamen, and κυμβος, a little boat, in allusion to the peculiar conformation of the stamens and their appendages.

850 *Trillium* From *trilix*, triple, the calyx has three sepals, the corolla 3 petals, the pistil 3 styles, and the stem 3 leaves These are curious little plants, somewhat difficult to keep Sweet says they do best on a bed of peat, and may be increased, though slowly, by the division of the root or by seeds

History, Use, Propagation, Culture,

851 *Colchicum* From Colchis, saith Dioscorides, where this plant grows in abundance; but it is probable that the term Colchicum was applied to all poisonous plants, among which this certainly held no inconsiderable place The economy of this plant in regard to its bulbs, flowers, and seeds, is singular, and may be classed with other anomalies found in Crocus, &c The bulb, which in C. autumnale is about the shape and size of that of a tulip, is formed in the following manner · —

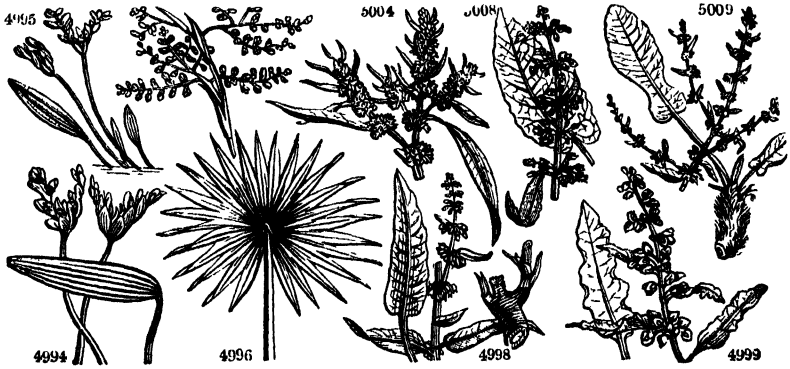
From the permanent, striated, dilated tuber of the old root, situated on one side, and clothed with the coats of the preceding root-leaves, a new plant springs, which is tuberous at the base, throws out fibres at bottom like other bulbs, and is received into the bosom of the former tuber, which embraces it half round This has an outer radical spathe, which is cylindric and tubular, cloven at top on one side, and half under ground. From two to six flowers half emerge from this spathe without leaves In the mean time the fruits, much later than the flowers, sit on the stem rising out of the spathe. As the plant advances the new tuber increases, the old one, deprived of its nutriment, perishes, and at the same time the former pushes forth from its base the germ of a succeeding plant. There are commonly two lateral germs from the same tuber, one lower, just described, bearing the flower and seed, the other superior, caulescent like the former, but more slender, and scarcely floriferous

The flowers, which arise with long slender tubes from the root, die off in the end of October, without leaving any external appearance of seeds These lie buried all the winter within the bulb, in spring they grow up on a fruit-stalk, and are ripe about the time of hay-harvest May not the very great length of the styles account in some measure for the delay in the ripening of the seeds? As this plant blossoms late in the year, and probably would not have time to ripen its seeds before winter, Providence has contrived its structure such, that it may be performed at a depth within the earth, out of the reach of the usual effects of frost, and as seeds buried at such a depth are known not to vegetate, a no less admirable provision is made to raise them above the surface when they are perfected, and to sow them at a proper season

4977 Leaves flat lanceolate erect

4978 Leaves linear channelled erect, Styles shorter than flower
4979 Leaves 5 ovate-oblong very broad, Flowers very numerous
4980 Leaves wavy spreading
4981 Two or many-flowered, Sepals linear oblong obtuse, Leaves small oval grassy-green
4982 Leaves 4 glaucous spiral, Flowers small very dwarf, Style one
4983 Leaves appearing with flower linear much spreading

4984 Scape leafy, Leaves oblong lanceolate, Flowers dicecious
4985 Leaves lanceolate ensiform nerved, Bractes linear-lanceolate
4986 Scape leafy, Raceme oblong, Bractes short oblong, Leaves smooth lanceolate linear
4987 Leaves channelled nerved, Segments of flower broad ovate with a transverse nectary at base
4988 Root horizontal, Leaves lanc. erect, Bractes longer than flower, Nectaries distinct
4989 Scape leafy, Raceme showy lax, Bractes membranous, Leaves subulate setaceous very long
4990 Raceme oblong lax, Leaves very long and narrow, Caps. oblong
4991 Leaves grassy, Panicle loose, Segments of flower ovate acute



4992 Leaves very long narrow dry, Flowers racemose

4993 Leaves oval, Spike one cylindrical
4994 Spike bifid, Leaves linear oblong floating, Bractes entire
4995 Spike bifid, Leaves linear lanc. erect, Bractes bipartite

4996 The only species

5010 Valves rounded cordate repand · one grained, Leaves cordate oblong wavy at edge
5011 Valves oblong obtuse entire : one grained, Leaves lanceolate
5012 Valves entire lanceol. one grained, Leaves cordate lanceolate
5013 Valves entire lanceolate acute grained, Upper leaves linear-lanceolate

and Miscellaneous Particulars

There are a few varieties of common Colchicum cultivated by florists, *viz.* the white, striped-flowered, striped-leaved, broad-leaved, many-flowered, and double-flowered No cattle are said to eat it, though it is remarkably abundant in the meadows of the Italian Alps, and the leaves must certainly be frequently made into hay

C autumnale, as a medicine, has been known since the days of Hippocrates. It possesses diuretic, purgative, and narcotic properties and on the continent, where it was recommended to notice by Baron Stoerck, it is a favorite remedy in dropsy, particularly hydrothorax, and in humoral asthma. But as it does not differ in its mode of action from squill, and is more uncertain in its operation, it has not been much used in that complaint in this country In gout and rheumatism, however, its efficacy has been fully ascertained and in allaying the pain it may be almost said to possess a specific property. It operates on the bowels chiefly, and the nerves, diminishing the action of the arterial system. (*Thomson's Mat Med* 257)

All the species are ornamental as border-flowers, and may be blown in water-glasses.

852 *Helonias* Derived from ἕλος, a marsh. Some of the species grow in bogs in N. America These plants delight in a moist situation and peat soil : they increase slowly by dividing at the root or by seeds.

853. *Nolina* Named after an American botanist of French extraction, called P. C Nolin. This plant is best grown in pots, as it requires protection during winter.

854 *Aponogeton* A name of the same meaning as Potamogeton (see that genus), of which it is probably an incomplete anagram. These plants are bulbous aquatics, and grow freely in loam and peat plunged in a cistern of water They are very pretty ornaments of the aquarium.

855 *Sabal.* A name employed by Adanson. It is supposed to have no meaning

856 *Rumex* A name given by the Latins to a root of thorn

R patientia (so called from the slowness of its operation as a medicine) and sanguineus, were formerly

CLASS VII.—HEPTANDRIA. 7 STAMENS.

A SMALL class, of which the Parinarium, which is a good tropical fruit, and the valuable Horse-chesnut, Æsculus, are the only remarkable genera The Astranthus is a curious genus of the natural order of Homalineæ.

Order 1. MONOGYNIA. 7 Stamens 1 Style.

862. *Trientalis* Cal 7-leaved Cor 7-parted, equal, flat Berry without juice
863 *Disandra* Cal about 7-parted Cor. rotate, 7-parted. Caps 2-celled, many-seeded
864 *Pisonia* Cal campanulate, 5-cleft Cor O Berry 1-celled, 1-seeded
865 *Petiveria* Cal 4-leaved Cor O Style lateral. Stigma pencil-shaped Seed 1, with four reflexed awns at the end.
866 *Æsculus* Cal 1-leaved, inflated Cor 4–5-petaled, unequal, pubescent, inserted in the calyx. Caps. 3-celled Seeds large, chesnut-like
867 *Jonesia* Cal 2-leaved Cor funnel-shaped, with a closed fleshy tube and 4-cleft limb. Nectary, a ring inserted in the throat of the tube A Legumen

History, Use, Propagation, Culture,

862. *Trientalis* From *treis*, the third of a thing; why so named we do not understand. Sir J E Smith says, "Few persons have seen the fruit of this plant, and it was most unaccountably mistaken, even by Linnæus and Gærtner The valves of the ripe capsule become concave externally, convex and polished within, and have been taken for a permanent corolla But they are opposite to the calyx leaves, which the segments of the corolla are not The beautiful tunics of the seeds were supposed to be the skin of a dried berry, and are not faithfully represented by Gærtner. (*English Flora*, vol ii 208)

863 *Disandra*. From *dus*, difficult, and *anyr andros*, a male, or, in botanical composition, a stamen, that is to say, a plant of which the stamens are subject to vary, and therefore difficult for botanists A trailing plant with bright yellow flowers

864 *Pisonia*. So named by Plumier, in honor of William Piso, a physician at Amsterdam, author of the Natural History of Brazil, 1648, fol P. aculeata is an inelegant tree with round reclining spiny branches, wanting support. It is common in the savannahs and other low places in the island of Jamaica, and in

868 *Dracontium* Spathe cymbiform. Spadix covered Cal O Petals 5 A berry
869 *Calla* Spathe ovate. Spadix covered Cal O. Cor O A berry
870 *Parnassum* Cal. 5-cleft. Petals 5 Stamens 14, of which 7 are barren. Drupe fleshy cribrose. Nut 2-celled, with 1-seeded cells.

Order 2. DIGYNIA.  7 Stamens 2 Styles.

871. *Limeum* Cal 5-leaved. Petals 5, equal. Caps. globose, 2-celled.

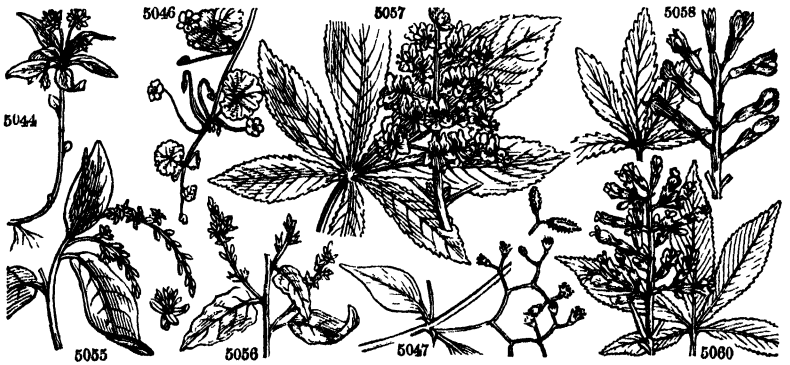
Order 3 TETRAGYNIA  7 Stamens. 4 Styles.

872 *Saururus* Cal. a spike of 1-flowered scales Cor O Ovaries 4 Berries 4, 1-seeded
873. *Astranthus* Cal O Cor hypocrateriform, with a 14-cleft limb Seed 1, small, superior.

Order 4. HEPTAGYNIA.  7 Stamens 7 Styles.

874 *Septas* Cal 7-parted. Petals 7 Ovaries 7 Caps 7, many seeded.

MONOGYNIA.



5044 Leaves lanceolate entire
5045 Leaves narrow lanceolate acuminate oblique

5046 Leaves reniform crenate, Flower-stalks in pairs

5047 Spines axillary horizontal, Leaves ovate narrowed at each end, Corymbs axillary
5048 Unarmed, Leaves opposite acuminate narrowed into a short stalk very smooth fleshy
5049 Unarmed, Leaves opposite a little narrowed towards the base entire smooth, Lateral nerves parallel
5050 Unarmed, Leaves ovate acuminate, Flowers cymose erect, Fruit berried
5051 Unarmed, Leaves opposite acute scarcely narrowed at the base entire smooth with parallel nerves
5052 Leaves ovate entire villous, Flowers in umbels
5053 Leaves shining pointed (*Lilac de Madagascar*)
5054 Leaves oblong acuminate smooth, Cymes compound, Flowers polygamous, Fruit spiny

5059 Leaves quinate pointed at each end downy beneath unequally toothed, Petals 4
5060 Leaves quinate beneath at the rib pubescent, Petals 4 with connivent claws longer than the calyx
5061 Leaves quinate quite smooth, Petals 4 spreading with claws the length of the calyx, Fruit spiny

and Miscellaneous Particulars.

several other islands in the West Indies, where it is very troublesome to whoever passes, fastening itself by its strong crooked thorns to the clothes, and the seeds being glutinous and burry, also fasten themselves to whatever touches them so that the wings of the ground-doves and other birds, are often so loaded with the seeds, as to prevent their flying, by which means they become an easy prey.

865 *Petiveria* So named by Plumier, in honor of James Petiver, apothecary of London, and fellow of the Royal Society, author of Museum, 1695; Gazophylacium, 1702, collected into one volume folio, with many plates P alliacea, is common in savannahs and woods in the West Indies, where it is a troublesome weed, and tastes the milk of cows that feed on it It is so acrid, that on chewing a little, it burns the mouth and leaves the tongue black, dry, and rough, as it appears in a malignant fever. It is thought, however, to be coveted by Guinea-hens, and hence its vulgar name of Guinea-hen weed.

866 *Æsculus*, or *Esculus*, as Pliny writes it. A name which the Latins gave to a tree which furnished them with an esculent nut that plant was the Quercus Esculus of Linnæus. *Marronier*, Fr, *Marronen-*

History, Use, Propagation, Culture,

baum, Ger, and *Marrone*, Ital Æ. hippocastanum (*ἵππος*, horse, horse-chesnut; because it was formerly a veterinary medicine) is a magnificent tree, at once grand from its magnitude and massy form, and beautiful when in blossom, from being covered with spikes of delicate white and pink flowers, protruding from among elegant digitate leaves It is a rapid growing tree, and speedily produces a considerable bulk of timber, which, however, is of little value as such The plant is best adapted for an ornamental tree in the outskirts of plantations, in avenues, or singly on lawns It is much prized by the French as an ornamental avenue tree, and when the geometric style of gardening was in vogue in this country was a good deal planted, as at Bushy park, Canons, Castle Howard, &c During the rage for the picturesque, it fell into disrepute from its "compact lumpish parabolic form," but the public are now convinced that there are other beauties besides those peculiarly adapted for representation by painters, and the taste for trees beautiful or interesting from their flowers, foliage, or other details, is now reviving The nuts or capsules are large and mahogany colored, and have often occasioned regret that they are not edible, like those of the Spanish chesnut Deer eat them greedily, and may be seen watching about the trees for their fall during windy weather. In Turkey they are ground and mixed with horse provender According to some, swine and sheep may be fattened on them, and poultry when they are boiled They are of a saponaceous nature, and broken and steeped in hot water might save soap, where that article is excessively dear This tree migrated from the northern parts of Asia into England by Constantinople, Vienna, Italy, and France Parkinson in 1629 places it in his orchard as a fruit tree, and describes the nuts as superior to the ordinary sort

E Pavia was so named by Boerhaave, in honor of Peter Paw, a Dutchman, and professor of botany at Leyden, in 1601

The other species have beautiful flowers, but are not free growing trees

5062 Leaves 6-7-nate obov acuminate 2-serrate, Petals 4 connivent with claws shorter than cal Anth smooth
5063 Leaves quinate, Petals spreading with claws shorter than calyx, Stam twice as long as cor Fruit spiny
5064 Leaves quinate, Petals 4, Stamens twice as long as corolla

5065 The only species

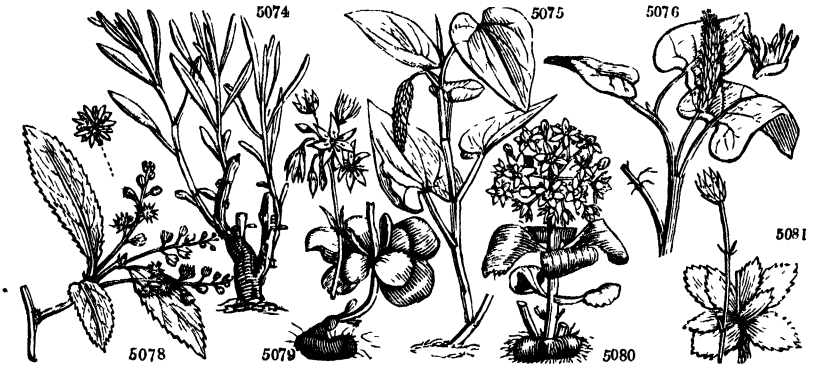
5066 Leaves supradecompound, pedate, Segments pinnatifid, Scape much shorter than leaf-stalks
5067 Leaves sagittate, Peduncles and petioles prickly
5068 Stem climbing, Leaves cordate ovate bored through

5069 Leaves sagittate cordate, Spathe cucullate, Spadix male upwards
5070 Leaves cordate, Spathe flat, Spadix hermaphrodite all over
5071 Leaves cordate acuminate, Spathe boat-shaped hiding the spadix

5072 Leaves ovate-oblong green above white beneath
5073 Leaves long oblong-lanceolate very white all over

DIGYNIA.

5074 Leaves oblong stalked



TETRAGYNIA

5075 Leaves cordate stalked
5076 Leaves deeply cordate ovate-lanceolate shining
5077 Leaves cordate ovate acuminate shining nerved

5078 Leaves ovate lanceolate serrated

HEPTAGYNIA.

5079 Leaves connate crenate roundish, Stem nearly leafless
5080 Floral-leaves 4 spatulate doubly crenate, Umbel compound
5081 Stem-leaves about two hooded and connate into a skreen, Flowers many minute

and Miscellaneous Particulars

867 *Jonesia* Named in honor of the famous Sir W Jones, who to his other accomplishments added the knowledge of botany The most fragrant tree of India Large cuttings root well in sand under a hand-glass.

868 *Dracontium* From δρακων, a dragon The stems of some species are mottled like the skin of a snake

869 *Calla* A name of one of Pliny's plants, which probably was applied to something of the same natural order as that now called Calla

870. *Parinarium* The Guiana name of the genus is Parinari Very fine trees with fine bunches of terminal flowers, which are succeeded by plum-like fruits, that in hot climates are esteemed and served up at table It has been called Petrocarya by Schreber and other Linnæan botanists, who fancy science to depend upon names

871 *Limeum* An ancient name of a poisonous plant It is derived from λοιμος, pest, poison It was used, says Pliny, to poison arrows with The plant to which modern botany has applied this name is a dangerous poison

872 *Saururus* From σαυρα, a lizard, and ουρα, a tail, on account of its long and pyramidal tail, which may be compared to the tail of a lizard Aquatic plants with neat foliage, but with no beauty in their flowers

873 *Astranthus* From αστερ, a star, and ανθος, a flower, on account of the star like disposition of the segments of the flower A small Chinese bush with serrated leaves, and spikes of pale whitish green flowers

874 *Septas.* From *septem*, seven. All the parts of the flower are in seven. Very neat little Cape plants, with umbels of white flowers.

Class VIII. — OCTANDRIA. 8 Stamens.

This is a class, which, with reference to the plants which compose it, is of much consequence to the botanist and gardener To the former it is recommended by the singular Melastomaceous plants which it contains, the curious Michauxia, and the Jeffersonia, remarkable for its capsule, which opens like a snuff-box. To the gardener it possesses irresistible attraction, not only in the delightful Tetratheceæ, Boroniæ, and Correas of New Holland, in the Dimocarpus of China, celebrated for its truly excellent fruit, and in the Fuchsias, Œnotheras, Combretums, and Vacciniums, some of which form the pride of our hardy gardens; but also in the magnificent tribe of Heaths, which are certainly the most beautiful of plants under cultivation This is abundantly attested by the splendid collections of Lee of Hammersmith, Rollison of Tooting, and last, but not least, of Loddiges of Hackney, where the precision of science is combined with the allurements of form and coloring

Order 1 MONOGYNIA.  8 Stamens. 1 Style.

§ 1. *Ovary superior*

875 *Tropæolum* Cal 1-leaved, 5-cleft, spurred Petals 5, unequal Nuts coriaceous, furrowed. Seed 1, roundish.
876 *Roxburghia* Cal 4-leaved. Petals 4. Nectary 4 lanceolate leaves inserted in the middle of the petals Anthers 2, hanging down from the base of each nectarial leaf Caps 1-celled, 2-valved, many seeded Seeds on a spongy placenta.
877 *Grisiea* Cal 4-cleft. Pet. 4, from the recesses of the calyx Filaments very long, ascending Capsule globose, 1-celled, many-seeded
878 *Boronia* Cal. 4-cleft, persistent. Petals 4, ovate Nect. coronate. Filam ciliated, incurved. Stigma capitate Caps 4, 2-valved Seeds solitary, with an arillus
879 *Tetratheca* Cal 4-cleft Petals 4 Anthers 4-celled Caps 2-celled, 5-valved, with valves bearing the septa in their middle Seeds about 2
880 *Correæa* Cal campanulate Petals 4 Caps 4-celled, opening with 4 valves Cells 1-2-seeded.
881. *Mimusops* Cal 4-leaved. Petals 4 Nectary 16-leaved Drupe pointed.
882 *Ornithrophe* Cal 4-parted Petals 4, bearded in the middle. Ovary double Berries 2, 1-seeded
883 *Dimocarpus* Sepals 5 Petals 5, reflexed, villous inside Berries 2, one of which is often abortive, barked, tubercled, 1-celled, 1-seeded.
884 *Melicocca* Cal 3-parted. Petals 4, reflexed below the calyx Stigma peltate Drupe with a bark
885 *Blighia.* Cal 5-parted. Petals 5 Style very short Stigmas 3. Seed solitary with a very large arillus
886 *Metaxba* Cal 5-parted Petals 5, with two scales at their base Caps. oblong, 1-celled, 2-seeded
887 *Koltreuteria* Sepals 5 Petals 4, irregular Nect 4 bifid scales Caps inflated, 3-celled, with 2-seeded cells
888 *Guarea* Cal 4-toothed. Petals 4 Nectary cylindrical, bearing the anthers on the orifice Caps 4-celled, 4-valved Seeds solitary.
889 *Amyris* Cal 4-toothed Petals 4, oblong, spreading Stigma capitate Berry drupaceous, by abortion 1-seeded
890 *Ximenia* Cal 4-cleft Petals 4, hairy, revolute Drupe 1-seeded
891 *Bæckia* Cal 5-cleft. Petals 5 Caps 3-4-celled, many-seeded, covered with the calyx Seeds few
892 *Erica.* Sepals 4, persistent. Cor 4-cleft, persistent. Filaments inserted in the receptacle Anthers bifid. Caps membranous, 4-8-celled
893 *Menziesia* Cal 1-leaved Cor 1-petalous, ovate Filam inserted in the receptacle Caps. 4-celled, with the septa from the inflexed edges of the valves. Seeds many, numerous
894 *Chlora* Sepals 8 or 10 Cor. 1-petalous, 8-cleft. Caps 1-celled, 2-valved, many-seeded
895 *Michauxia* Cal many-cleft Cor rotate, 8-10-parted, revolute Nect. 8-valved, staminiferous. Caps 8-10-celled, many-seeded
896 *Jeffersonia* Sepals 5, colored, deciduous Petals 8, incurved spreading Stamens surrounding the ovary Caps obovate, stipitate, 1-celled, opening below the end.
897 *Dodonæa* Sepals 4 Cor. O. Filaments very short. Anth. oblong. Caps 3-celled, 3-winged Seeds 2
898 *Lawsonia* Cal. 4-cleft. Petals 4 Stamens in 4 pairs Caps 4-celled, many-seeded. Seeds angular

§ 2. *Ovary inferior.*

A *Seeds many*

899 *Osbeckia* Cal 4-cleft its lobes separated by a fringed scale Cor of 4 or 5-petals Anthers rostrate Caps 4-5 celled, surrounded by the truncated tube of the calyx Recept compressed, half ovate.
900 *Rhexia* Cal urceolate, 4-5-cleft. Petals 4, inserted in the calyx, oblique Anthers declinate Caps setose, 4 celled, inside the calyx Recept lunate. Seeds numerous cochleate
901 *Œnothera* Cal tubular, 4-cleft, with deciduous deflexed segments Petals 4, inserted in calyx Stigma 4-cleft Caps 4-celled, 4-valved, inferior Seeds naked, affixed to a 4-cornered central receptacle
902 *Gaura* Cal 4-cleft, tubular Petals 4, ascending towards the upper side Nect inferior, 1-seeded.
903 *Epilobium* Cal 4-cleft, tubular Petals 4 Caps oblong, inferior Seeds comose
904 *Fuchsia* Cal funnel-shaped, colored, deciduous Petals 4, in the throat of calyx, alternate with its segments Nectary an 8-furrowed gland Stigma capitate Berry oblong, obtuse, 4-cornered, 4-celled
905 *Jambolifera* Cal 4-toothed. Petals 4, funnel-shaped Filaments flattish. Stigma simple Fruit a 4-celled drupa
906. *Oxycoccus* Cal. 4-cleft Cor 4-parted, with linear revolute segments. Filaments conniving. Anthers tubular, 2-parted. Berry many-seeded
907 *Vaccinium* Cor urceolate or campanulate, 4-5-cleft, with reflexed segments. Filaments inserted on the ovary. Berry 4-5-celled, many-seeded.

B *Seed one*

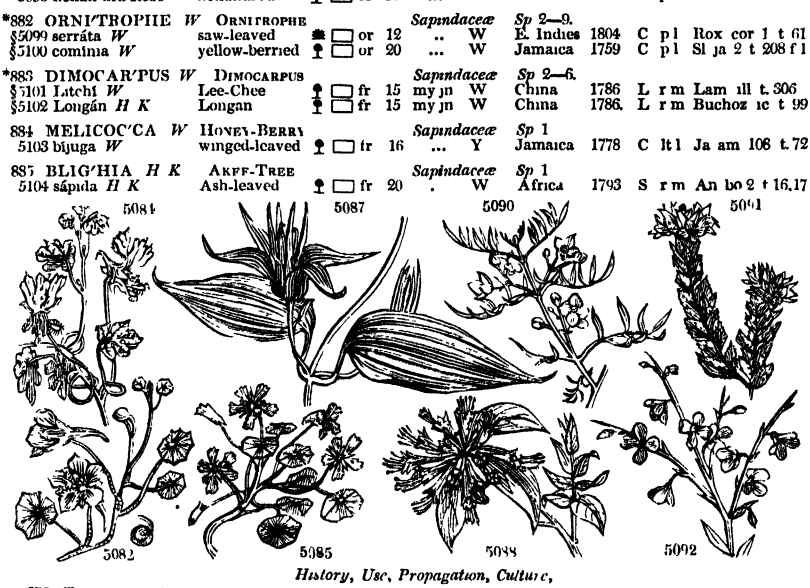
908 *Memecylon* Cal with a striated bottom, and an entire edge Cor 1-petalous. Anthers inserted on the side of the end of the filament Berry crowned with the cylindrical calyx
909 *Lagetta* Cor caducous, tubular, 4-toothed, with 4 petal-like glands. Drupe hairy, pisiform, 1-seeded
910. *Daphne* Cor. 4-cleft, like a corolla, withering, including the stamens Drupe 1-seeded.
911. *Dirca* Cor. tubular, with an obsolete limb Stamens longer than tube Berry 1-seeded.

912. *Gnidia.* Cor. funnel-shaped, 4-cleft; with 4-8-petaloid scales at the orifice. Nut somewhat drupaceous
913. *Stellera.* Cor. 4-cleft, inflated in middle Stam inserted in throat, very short. Nut 1, beaked.
914 *Passerina.* Cor. 4-cleft, naked. Style filiform, lateral, long. Stamens inserted on the tube Nut 1, coated.
915 *Lachnæa* Flowers in heads Cor. 4-cleft, with an unequal limb Filaments long, with an unequal insertion. Nut somewhat drupaceous
916. *Combretum.* Cal. 4 toothed, campanulate, superior. Petals 4, inserted in the calyx Stamens very long. Caps. 4-angular, with membranous angles, 1-celled. Seed 1, oblong.

Order 2. DIGYNIA.  8 Stamens. 2 Styles.

917. *Galensa* Cal. 4-cleft. Cor. O Capsule roundish, 2-seeded.
918 *Aphananthe* Sepals 5. Two stamens opposite 2 sepals, 6 opposite and alternate with three other sepals
919. *Weinmannia.* Sepals 4 Petals 4 Caps. 2-celled, 2-beaked.
920 *Mohringia.* Sepals 4. Petals 4. Caps. 1-celled, 4-valved.

Order 3. TRIGYNIA.  8 Stamens 3 Styles



921 *Polygonum.* Cal. O Cor. 5-parted, like a calyx Seed 1, angular, covered. (Stamens and styles uncertain in number)
922 *Coccoloba.* Cal. 5-parted, colored, finally becoming berried. Cor O Berry formed of the calyx, 1-seeded.
923 *Paullinia* Sepals 5. Petals 4 Nect. 4-leaved, unequal Caps turbinate, 3-cornered, 3-celled, with 1-seeded cells. Seeds with an arillus.
924 *Serjania.* Sepals 5. Petals 4 Nect 4-leaved. Samaræ 3, longitudinally united, globose, connected downwards in a membranous wing
925. *Cardiospermum* Sepals 4 Petals 4 Nect 4-leaved, unequal. Caps 3, connate, inflated.
926. *Sapindus.* Sepals 4. Petals 4. Caps fleshy, connate, ventricose.

Order 4. TETRAGYNIA.  8 Stamens. 4 Styles.

927 *Verea* Sepals 4 Cor hypocrateriform, 4-cleft, with acute segments, and a ventricose tube Scales 4, at the base of the ovaries, linear Capsules 4, 1-celled, many-seeded
928 *Bryophyllum* Sepals 4. Petals 4, connate into a cylinder Seeds many
929. *Paris* Sepals 4 Petals 4, narrower Anth attached to the middle of filament Berry 4-celled
930 *Adoxa* Cal. 2-3-cleft, inferior. Cor 4-5-cleft, superior Berry 1-celled, 4-5-seeded, united with the calyx.
931 *Elatine* Sepals 4 Petals 4 Caps 4-celled, 4-valved, depressed, many seeded, the dissepiments opposite the sutures
932 *Haloragis* Sepals 4, superior Petals 4, caducous Drupe dry Nut 4-celled
933. *Forskohlea.* Cal. 4-leaved Petals 8 spatulate. Seeds 4 enveloped in wool.

History, Use, Propagation, Culture,

875 *Tropæolum* From *tropæum*, a trophy The leaf resembles a buckler, and the flower an empty helmet, of which trophies were formed T majus is an ornamental annual, and also a culinary plant The flowers are eaten in salads, and are very grateful they are also used as a garnish The seeds, which consist of three conjoined berries or nuts, with grooved wrinkled gibbous husks that become fungous when dry, are pickled in salt and vinegar, and used as a substitute for capers, to which some prefer them In the evening the flowers emit spontaneously at certain intervals visible sparks like those of an electric machine This was first observed by the daughter of Linnæus

876 *Roxburghia* In honor of William Roxburgh, M D born in Scotland, and settled in the East Indies, author of a splendid work on the plants of the coast of Coromandel. A singular plant, the natural affinities of which are yet obscure, it grows in loam and peat, and may be increased, though but slowly, by dividing at the root

877 *Grislea* So named after G Grisley, a Portuguese surgeon, author of Viridarium Lusitanicum, 1661 A free flowering shrub of considerable beauty, it grows in loam and peat, and cuttings root in sand under a hand-glass in heat

878 *Boronia* So named after Francis Borone, an Italian servant of Dr Sibthorp, who perished from an accident at Athens Pretty little New Holland plants, generally with red flowers These are valuable plants, as flowering nearly all the year "They thrive best in sandy peat, with the pots well drained with broken potsherds They may be propagated by layers or ripened cuttings, taken off at a joint and planted in sandy peat, and placed under a bell-glass, will strike root, if properly managed the glass must be taken off occasionally to dry them, as they are very liable to damp off"

879 *Tetratheca* From τετρα, four, and θηκη, a cell, in allusion to the four cells of the anthers, for which the plants are remarkable Cuttings root in sand under a bell-glass

880 *Correæa* So named after Joseph Correa de Serra, a learned Portuguese, who, without publishing much, was one of the most profound theoretical botanists of this age He died at Lisbon in 1823 "Ripened cuttings

* *MONOGYNIA.*

5082 Leaves peltate repand mucronate, Petals acute

5083 Leaves peltate repand, Petals obtuse

5084 Leaves peltate 5-lobed palmate toothed, Petals jagged

5085 Leaves peltate, Lobes obtuse unequal, Flowers pinnate
5086 Leaves peltate 5-lobed, Lobes obtuse repand, Petals cuneate toothed at end

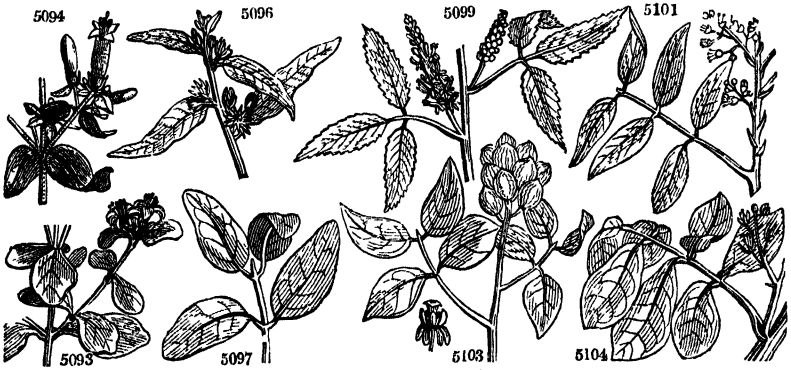
5087 Leaves cordate many-nerved

5088 Leaves minute tomentose beneath, Corymbs axillary spreading

5089 Leaves linear lanceolate entire tomentose beneath
5090 Leaves pinnated with an odd one in 2-4-pairs very smooth, Leaflets linear acute, Pedunc dichotomous
5091 Leaves simple trapeziform acute serrulate at end smooth

5092 Leaves alternate few lanceolate and branches smooth

5093 Leaves ovate downy beneath, Teeth of calyx small acute distant
5094 Leaves ovate obtuse beneath rusty with down, Flowers erect, Calyx truncate
5095 Leaves ovate-oblong cordate, Flowers pendulous, Calyx with 4 acute teeth



5096 Leaves alternate ovate acuminate
5097 Leaves alternate clustered at the ends of the branches oblong very obtuse
5098 Leaves alternate obovate emarginate, Flowers hexandrous

5099 Leaves ternate rough, Leaflets stalked ovate acuminate serrate, Racemes simple
5100 Leaves ternate, Leaflets stalked oblong narrowed at each end pubescent beneath, Racemes compound

5104 The only species

and Miscellaneous Particulars

will root freely in sand under a bell or hand-glass The cuttings must not be planted too thick, or they will be liable to damp C. speciosa has generally been reckoned difficult to strike from cuttings, but it roots as freely as the others if properly managed, and requires the same treatment"

881 *Mimusops* From μιμος, an ape, and οψις, figure The flowers are thought to resemble the countenance of a monkey Ripened cuttings root readily in sand under a hand-glass

882. *Ornithrophe* From ορνις, a bird, and τροφη, nourishment Its fruit is much eaten by small birds In the Isle de France it is called *bois de merle*, or *thrush-wood*. Cuttings root in sand under a hand-glass

883. *Dimocarpus* From δισμος, double, and καρπος, fruit, its fruit grows in pairs These are fruit-bearing trees, cultivated in China The fruit is a berry in bunches of a red color, and rather larger than the grape The bunches are small, the skin of the berry is tough and leathery, the pulp is colorless, semitransparent, and of a slightly sweet subacid taste The fruit of D Litchi is frequently brought to England dried like raisins; that of D Longan has been ripened by John Knight, Esq of Lee Castle, in a lofty stove, erected for the purpose of growing tropical fruits A bunch was presented to the Horticultural Society, in September 1816, "supposed to be the only one ever produced in Europe, and which persons well acquainted with the long-yen in its native places of growth, pronounced to be quite as good as those grown within or near the tropics" (*Hort. Trans* ii 408)

884 *Melicocca.* From μελι, honey, and κοκκος, fruit, its fruit, which resembles the yolk of an egg, has a very sweet flavour mixed with a little acid This tree is cultivated in some parts of South America and in Jamaica for its fruit, which grows to the size of a large plum, and is very mellow The natives suck it for the sake of the salivation which it produces In our stoves it thrives well in light loamy soil, and cuttings root in sand under a hand-glass in heat

885. *Blighia* Named in honor of the famous Captain Bligh, who first carried the bread-fruit to the West Indies This is an esteemed African fruit tree with a reddish or yellow pome, about the size of a goose's egg,

History, Use, Propagation, Culture,

with the arillus of the seed of a grateful subacid flavor In the West Indies it is esteemed very wholesome and nourishing Here it grows well in loam and peat, and ripened cuttings with all their leaves on root best in sand under a hand-glass

886 *Metaiba* The vernacular name of the plant in French Guiana Large cuttings root best under a hand-glass in sand.

887 *Kolreuteria* So named by Laxmann, in honor of Joseph Gottlieb Kölreuter, who published *De plantis quibusdam Rariorib*us, *Tubing*, 1755, with a dissertation *De Insectis Coleopteris* He also made many experiments on the pollen of flowers, hybrid plants, &c published in the Petersburgh Transactions

This shrub should be planted in as sheltered a situation as possible, as it will not flower if too much exposed, and if the wood is not well ripened, the tops of the shoots will be injured by the frost.

888 *Guarea* The natives of Cuba call the plant *Guara* This tree, though it has an inconspicuous flower, yet has fine large leaves All parts of the plant, especially the bark, smell strong of musk, and may be used instead of that perfume for many purposes The wood is full of a bitter resinous substance, which renders it unfit for rum-hogsheads, being observed to communicate both its smell and taste to all spirituous liquors: but it is often cut for staves and heading, when there is a scarcity of other timber The powder of the bark is said to be a good emetic, and is sometimes used among the negroes for that purpose Ripened cuttings root in sand under a hand-glass

889 *Amyris* Derived from μύρρα, myrrh Its resinous gum has an excellent perfume. Almost every species of this genus produces some valuable gum or resin A. gileadensis produces the celebrated balm of Gilead It is a shrub with purplish branches, striated a little, with crowded ternate leaves, and protuberant buds loaded with balsamic resin

5105 Leaves alternate abruptly pinnated in 2-3 or 4 pairs

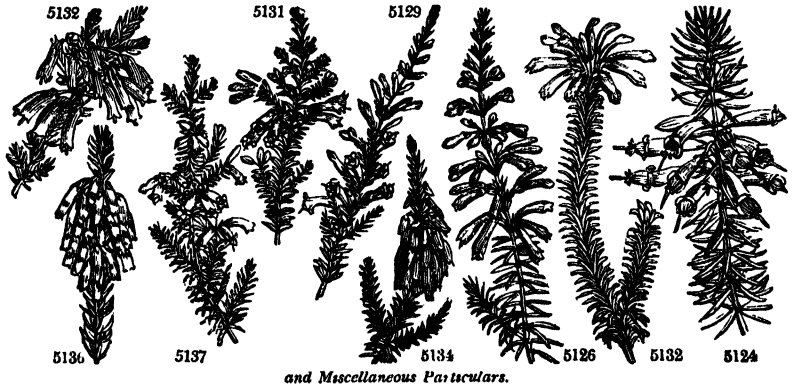
5106 The only species Leaves pinnated toothed torn

5107 Stalks of the leaves short tumid inflated

5108 Leaves simple lanceolate entire, Racemes simple axillary numerous
5109 Leaves ternate crenate acute

5110 Peduncles many-flowered, The lower usually changed into spines

5111 Leaves opposite beardless, Teeth of calyx membranous colored
5112 Leaves linear lanceolate, Peduncles axillary umbelled
5113 Leaves imbricated four ways obtuse with a little reflexed point, Teeth of calyx leafy



A TUBIFLORÆ *Corollas long and cylindrical*

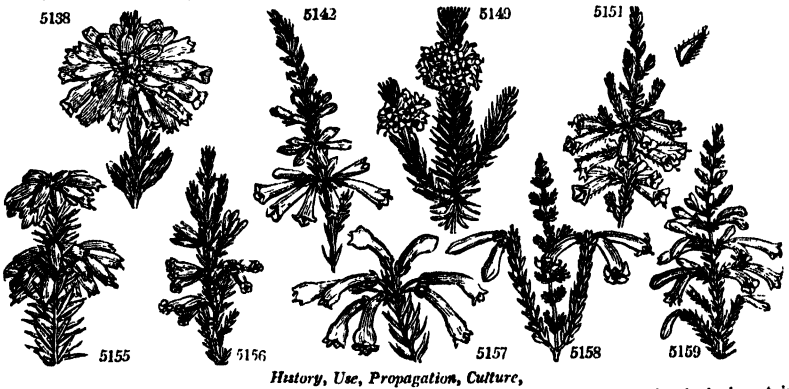
5114 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Bractes distant from calyx
5115 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Flowers solitary, Cor cylindrical
5116 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Segments of cor reflexed
5117 Stamens long connivent colored, Lvs. in 3s, Cal imbricated, Fl 3, Cor globose scarcely longer than cal.

5118 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Flowers solitary, Cor conical

5119 Anth bearded, Style incl Cor cylind contracted above the base, Fl pend Leaves 4 whorled
5120 Stamens long connivent colored, Leaves in threes, Cal imbricated, Flowers 3, Cor, cylindrical incurved
5121 Anthers bearded, Leaves in threes, Flowers terminal solitary
5122 Stamens exserted colored, Leaves in 3s, Cal imbricated, Flowers 3, Cor conical, Leaves recurved
5123 Anth bearded incl Style exsert Cor tubular clavate pubes Fl axill Leaves 3 imbricated
5124 Anthers beardless exserted, Cor incurved smooth, Style long, Flowers axillary stalked, Lvs 6 smooth
5125 Anth beardless included, Style exserted, Cor tubular clavate, Cal pubescent, Fl capitate, Leaves 6
5126 Ant beard includ. Style exsert. Cor tub incurv Cal simple gland tooth Fl axill. whorl Lvs 3 rough
5127 Anthers beardless, Lvs 3, Flowers solitary or 3 term Cal imbric Cor villous [at edge
5128 Cor cylind Anthers bearded, Lvs 3, Fl term 3, Cal imbric Style exserted rounded at end
5129 Anthers beardless, Lvs 4, Fl term Bractes ovate distant from cal Sepals ovate acumin
5130 Anthers bearded included, Style exserted, Cor tubul clav Cal double, Fl term 3, Lvs 3 smooth
5131 Anthers beardless, Leaves 3 smooth, Fl 3 term Cal imbric Corolla smooth
5132 Anth. bearded, Style incl. Cor cylind ventric Flowers umbelled capitate, Lvs 8 linear truncate

5133 Anth beardless exserted, Cor tub clavate pubescent, Fl term racemose, Leaves 5 or more smooth
5134 Anth bearded, Style includ. Cor. clav cylind Flow umbell Lvs 6 linear reflexed
5135 Anth beardless included, Style exserted, Cor ventricose at base, Fl term Lvs 4 pubescent erect
5136 Anth bearded, Lvs 4-6, Fl axill. Cal imbr Bract lanc Sepals broad lanceol
5137 Anth beardless, Lvs 4 ciliated, Fl term Two bractes next cal one distant, Cor smooth

and Miscellaneous Particulars.



A Opobalsamum produces the balsam of Mecca It has pinnate leaves, with sessile leaflets It grows near Bederhunin, a village between Mecca and Medina, in a sandy rocky soil, confined to a small tract about a mile in length, and attains the height of fifteen feet. The balsam is obtained by incision. Neither of these species are yet introduced to Britain: those we possess grow in loam and peat, and cuttings root freely in a pot of sand under a hand-glass.

890. *Ximenia.* Francis Ximenes was a Spanish naturalist from whom we have, published in 1615, four works upon the plants and animals useful in medicine in New Spain The flowers of this tree have an odor like frankincense: the fruit is yellow, shiny, the size of a pigeon's egg, with a thin rind and sweet subacid pulp: it is eaten by negroes and children in the West Indies. Cuttings root in sand under a hand-glass.

891 *Bæckia* From Abraham Bæck, who was physician in ordinary to the king of Sweden, and who communicated plants to Linnæus, by whom the genus was dedicated. These plants are of free growth in sandy loam and peat, and so hardy as to require little more than protection from frost during winter Young cuttings root in sand under a bell-glass

892 *Erica.* From ἐαγω, to break, in allusion to the brittle branches of the plant It was also reputed a specific for breaking the stone in the bladder. *La bruyère*, Fr, *Heide*, Ger., *Erica*, Ital, and *Brezo*, Span. Ling or common heath abounds in barren wastes in every part of Europe, and especially in the northern countries Though little regarded in warm climates, the different species of native Erica are made subservient to a great variety of purposes in the bleak and barren highlands of Scotland, and other northern countries. The poorer inhabitants cover their cabins with them instead of thatch, or else twist them into ropes, and bind down the thatch with them in a kind of lattice work They also make the walls with alternate layers of heath, and a sort of cement made of black earth and straw The hardy Highlanders frequently

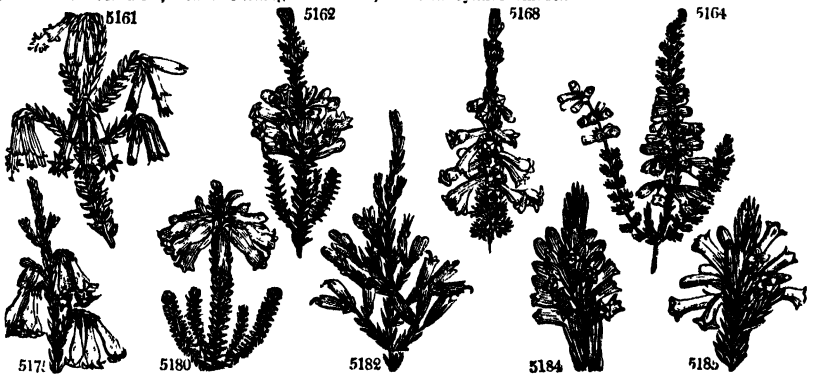
History, Use, Propagation, Culture,



make their beds with it In most of the western isles they dye their yarn of a yellow color, by boiling it in water with the green tops and flowers of this plant, and woollen cloth boiled in alum water, and afterwards in a strong decoction of the tops, comes out a fine orange color In some of these islands they tan their leather in a strong decoction of it Formerly the young tops are said to have been used alone to brew a kind of ale, and Boethius relates that this liquor was much used by the Picts. In some of the isles it is said they still brew ale with one part malt, and two parts of the young tops of heath, sometimes adding hops In many parts of Great Britain besoms are made of it The turf, with the heath growing on it, is cut up and dried for the fuel of the cottager, for heating ovens, covering under-ground drains, &c Sheep and goats will sometimes eat the tender shoots, but they are not fond of them Cattle not accustomed to browse on heath give bloody

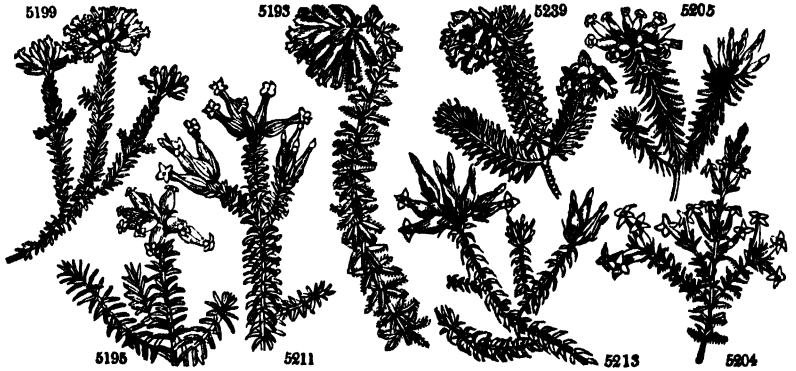
5148 Anthers beardless, Flowers 3, Cal imbricated, Cor smooth, Leaves pubescent
5149 Anth beardless exserted, Ovary turbinate, Lvs. 4-6, Fl axillary, Two bractes close to cal one remote
5150 Anthers beardless exserted, Lvs 4-6, Flowers axill Bractes remote, Ovary with 8 furrows smooth
5151 Anthers beardless included, Bractes next calyx, Cor hairy solitary, Leaves 4 hairy
5152 Anthers exserted gibbous at base, Bractes remote, Cal leafy, Lvs 4, Branches hairy, Fl terminal

5153 Anthers beardless, Lvs 4, Bractes a little distant from cal Sepals oblong revolute at edge
5154 Anthers beardless exserted, Lvs 4, Bractes linear distant from cal Sepals ovate acuminate
5155 Anth beardless, Lvs 4-6, Fl axill Two bractes next cal one remote, Ovary cylind Cor pubescent viscid
5156 Anthers beardless included, Lvs 4, Fl term few, Bractes lin remote, Sepals ovate acuminate
5157 Anthers beardless, Lvs 4-6, Fl axill. Two bractes next cal one remote, Ovary cylind Cor smooth viscid
5158 Anthers beardless included, Lvs 4, Fl term few, Bractes remote, Sepals ovate obtuse
5159 Anth beardless, Cor curved clavate smooth, Fl solitary term Leaves 4 linear smooth
5160 Anth. beardless included, Cal leafy imbricated, Leaves 3 smooth spreading, Style exserted
5161 Anth beardless exserted, Cor cylind ovate, Sepal col obl obt Leaves 3 appressed erect, Fl 3 terminal
5162 Anth beardless included, Cor cylindrical narrowed at base, Fl term umbell Leaves 6 smooth
5163 Anth beardless, Lvs 4, Fl. term 4 closely packed in 4-cornered head, Sepals lin subul Ped length of fl
5164 Anth beardless, Leaves 4, Fl term 4 closely packed in a 4-cornered head, Sepals lanceolate
5165 A handsome species with tufted hairy leaves It resembles E. linnæana
5166 Anth beardless, Leaves 4, Fl term 4 closely packed in a 4-cornered head, Sepals ovate roundish
5167 Anth beardless, Leaves 4, Fl axillary, Cor ribbed, Bractes nearly as long as calyx
5168 Anth beardless included, Leaves 6 ciliated, Flowers terminal, Cor clavate at first white afterwards red
5169 Anth beardless, Lvs 4-6, Fl axillary, Cor ribbed cylind with a spreading limb, Bractes ½ length of cal
5170 Anth beardless, Lvs 4-6, Fl axill Cor ribbed widest in middle with a revol limb, Bractes length of cal
5171 Leaves spreading smooth, Flowers clavate incurved smooth
5172 Anth beardless, Leaves 4-6, Fl axillary, Cor not ribbed, Sepals linear
5173 Anth beardless, Leaves 4-6, Fl. axillary, Cor not ribbed, Sepals from a broad base linear subulate
5174 Anth. beardless, Leaves 4-6, Fl axillary, Cor not ribbed, Sepals ovate acuminate
5175 Leaves upright smooth, Fl term 4 turbinate hairy
5176 Anth includ beardless, Bractes remote from flower, Leaves very short imbricated
5177 Leaves 3 smooth spreading distant, Fl axillary pendulous cylindrical smooth
5178 Anth beardless included, Leaves 4-6, Fl axill Two bractes next cal one remote, Ovary turbinate
5179 Leaves 4 hairy clammy, Fl cylindrical terminal curved smooth, Style exserted
5180 Anth beardless, Leaves 4-6 hairy, Fl axill Two bractes next cal one remote, Ovary clavate
5181 Leaves short with long hairs, Fl large axillary pendulous cylindrical with a green mouth
5182 Anth bearded, Leaves 3 ovate rough, Fl 3 cernuous smooth, Cal villous colored
5183 Anth beardless exserted, Leaves 4-6, Fl axill Bractes remote, Ovary with 4 furrows smooth
5184 Anth. beardless included, Lvs. 4-6, Fl axill Bractes remote, Limb of cor revolute, Ovary with 8 furrows [silky upwards

5185 Anth beardless included, Leaves 4-6, Fl axill Bractes remote, Limb of cor erect spreading
5186 Anth beardless exserted, Leaves 3, Fl terminal numerous, Bractes remote
5187 Anth beardless included, Leaves 3 hairy, Fl capitate, Cal imbr Cor very hairy
5188 Anth beardless, Leaves 4 triangular smooth, Fl term cylindr smooth



and Miscellaneous Particulars.

milk, but are soon cured by drinking plentifully of water The branches of heath afford shelter, and the seeds a principal part of their food to many birds, especially those of the grouse kind: and for this purpose the seed-vessel is formed and protected in such a manner, that the seeds are preserved a whole year, or even longer. Bees collect largely from the flowers, and honey made from them was anciently supposed to be of a bad quality, but in fact it is only of a darker color The foliage affords nourishment to the Phalæna quercus or great egger moth. Dodder frequently entwines itself about this plant, and gives it a singular appearance.

Till the latter end of the last century, this genus consisted of three or four humble British shrubs, and the heath of Spain (E. mediterranea), a slow growing tree. But when the Cape of Good Hope fell into the hands of the British, collectors were sent out, and soon brought to light some hundreds of species. It may serve as

History, Use, Propagation, Culture,

an easily recollected date, to say that all of them were sent home during the reign of George III., and as a tribute to merit, that most of them were gathered by Mr Francis Masson Their beauty needs no encomium; many are pretty, some are graceful or elegant, a few splendid, and there are curious, grotesque, and odoriferous species. Their culture and propagation is one of the most delicate branches of the art of gardening: it may be said to have been invented in England, and in the Hammersmith nursery, and places Britain far before all countries in this art as in so many others.

The only soil in which heaths will grow is earth of peat: if any substitute can be found, it is in leaf-mould

B. VENTRICOSÆ. *Corolla inflated*

5189 Anthers bearded, Bractes oblong next cal Cor. twice as long as calyx
5190 Anthers bearded, Bractes ovate next cal Cor. 4-cleft thrice as long as calyx
5191 Anthers bearded, Bractes ovate next cal Cor. 4-parted scarcely twice as long as calyx
5192 Anthers bearded included, Cal. leafy, Bractes remote from fl. Leaves 4 spreading smooth
5193 Anthers beardless, Flowers terminal, Two bractes next fl : one remote, Cor viscid-hairy
5194 Cal rhomboid-spatulate, Cor woolly inside, Leaves narrow-ovate cuneate pectinate
5195 Anth. beardless, Fl term Two bractes next fl · one remote, Cor smooth, Sepals lin lanceolate
5196 Anth. bearded, Two bractes next fl , one remote, Leaves 6, Beards of anth. very short
5197 Anth bearded, Bractes remote, Leaves 4 smooth, Beards of anth. very long
5198 Anth. beardless, Fl term 8, Bractes remote, Leaves 4, Sepals terminated by 3 or more bristles
5199 Anth. beardless, Fl term Two bractes next cal , one remote, Cor smooth, Sepals ovate acuminate
5200 Pubescent, Two subul. bractes next cal Leaves decussate 4, Cor villous many times longer than calyx
5201 Cal minutely ciliated, Tube narrow-cylindrical urceolate, Anthers beardless
5202 Anth beardless, Fl. term 4, Cal. imbric Sepals ovate oblong acute, Leaves recurved ciliated
5203 Anth. beardless, Fl. term. many, Cal imbric Leaves recurved terminated by a bristle

C. LIMBATÆ. *Corolla elongated, narrowed upwards, with a flat limb.*

5204 Anth beardless, Leaves ciliated and flowers 4, Sepals subulate, Stigma exserted
5205 Anth bearded, Bractes remote, Leaves 4 ciliated, Beards of anth very short
5206 Anth bearded included, Leaves 4 ciliated, Fl capitate, Bractes remote
5207 Anth bearded included, Cor globose ovate, Leaves opposite and scattered fringed with glands linear

5208 Anth. beardless, Fl terminal 3, Leaves 3, Bractes remote, Sepals subulate, Cor 4-cornered
5209 Anth included beardless, Fl. umbelled, Bractes remote
5210 Anth beardless, Fl term. 3, Leaves 3, Bractes remote, Sepals ovate oblong
5211 Anth beardless, Fl term 4, Leaves 4, Bractes remote
5212 Flowers long conical striped, with a flat limb, The whole surface of corolla shining
5213 Anth beardless, Fl term 8, Leaves 4, Bractes remote, Sepals terminated by a long bristle
5214 Anth beardless, Fl term 4, Cal imbricated, Sepals from a broad base, subulate, entire
5215 Anth beardless, Fl term. Leaves 4 smooth, Cor slender, Style included
5216 Anth beardless, Fl term 4, Cal. imbricated, Sepals ovate acuminate serrulate
5217 Anth. beardless included, Flowers fascicled, Style included, Leaves 4

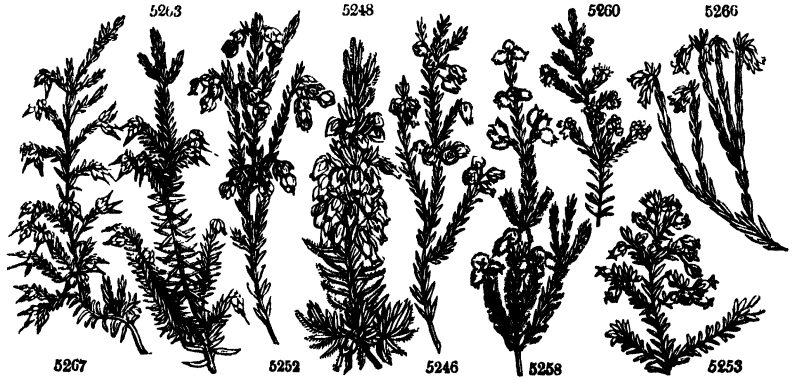
5218 Anth included beardless, Leaves 4 smooth erect, Fl term Cal imbricated leafy
5219 Anth. beardless, Leaves 3, Fl term Fl 3, Bractes remote, Cor viscid
5220 Anth bearded, Style included, Flowers terminal, Leaves lin 2 smooth, Branches deflexed
5221 Anth beardless included, Style included, Leaves 4, Flowers clustered

5222 Anth beardless, Cor somewhat 4-cornered, Sepals lanceolate entire, Fl term sessile, Leaves 4 smooth
5223 Cal ovate cuspidate scarcely serrated, Cor. three lines long, Limb twice as short as tube recurved
5224 Leaves 4 spreading, Fl 4 terminal
5225 Leaves 4 erect, Fl simple on little axillary branches, Cor ovate
5226 Leaves 3 smooth erect imbricated, Fl 3 terminal, Cor hypocrateriform, Tube slender
5227 Anth. beardless included, Sepals membranous ciliate toothed, Fl term sessile, Leaves 4 smooth
5228 Anth beardless included, Leaves 4-6, Fl axill Bractes remote, Limb of cor revolute, Ovary smooth
5229 Anth beardless, Fl terminal, Cal. imbricated, Fl 4 Sepals oblong obtuse, Leaves recurved setose
5230 Anth beardless, Flowers terminal subsessile 5, Bractes next calyx, Leaves spreading 5

5231 Leaves short erect, imbricated, Flowers terminal solitary, Tube ovate, Limb recurved
5232 Leaves 3 filiform spreading, Fl 3 term rotate, Stamens and styles exserted
5233 Leaves dense acerose smooth erect, Fl axillary, Tube cylindrical
5234 Leaves densely imbricated erect, Flowers large axillary, Petals sawed
5235 Leaves dense spreading, Fl 4 terminal, Tube ovate longer than limb
5236 Leaves 4 narrow erect smooth, Flowers terminal 4 very numerous, Tube ventricose

D CALYCINÆ *Corolla inclosed in the inflated calyx*

5237 Anthers crested, Cor. ovate, Style included, Cal turbinate, Leaves 3, Flowers umbelled



5238 Anthers crested, Bracteas remote, Leaves 3 much longer than the joints green
5239 Anth. crested, Leaves 3, Cal imbricated, Style included, Flowers terminal, numerous
5240 Anth crested, Leaves 3, Cal imbricated, Style included, Flowers terminal three

and Miscellaneous Particulars.

sifted very fine and mixed with fine sand Earth of peat is obtained by collecting peats from bogs or turf from the surface of peaty wastes and moist places, and laying the peats or turves in a heap to rot and moulder into earth This they will require several years to do, but in the meanwhile a portion of mould may be obtained whenever it is wanted, by turning the turves and sifting the fragments Sometimes this peat is found without any mixture of sand, at other times, where streams have run into the bog or lake while the peat was forming, it is mixed with fine sand that had been held suspended in the water This last is the best sort of peat for the Erica family, and therefore where peat is not sandy naturally, fine white sand

History, Use, Propagation, Culture,

or sand of any color, provided it be free from irony impregnation, should be procured and mixed with it This sand admits the water to penetrate into the soil and reach the roots of the plant, and also to drain away from the roots so as not to rot them Pots filled with pure peat-earth are apt to be either hard, dry, and impenetrable to water, or otherwise as wet as a saturated sponge The free growing kinds (according to Sweet) thrive best in good black peat, and like largish pots to grow in The dwarf and hard-wooded kinds like a very sandy peat, and smaller pot, well drained with broken potsherds and rough bits of turfy peat, they also require less water than the free growing kinds, as they grow chiefly at the Cape on the tops and sides of mountains, and in the crevices of rocks, &c chiefly in very sandy soil, and but little of it

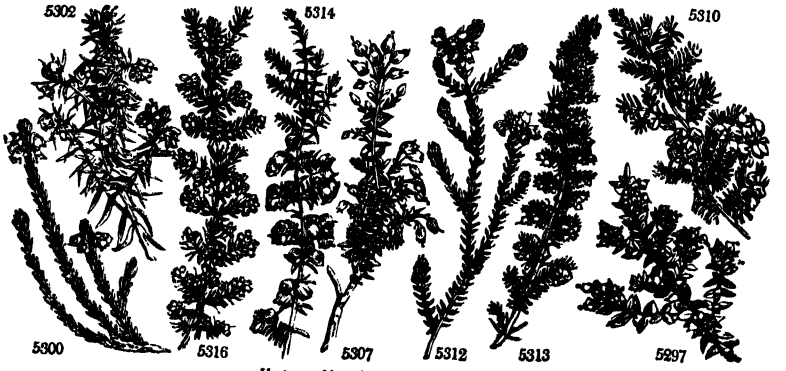
5241 Anth. crested, Leaves 3, Cal. imbricated, Sepals carinate, Flowers terminal three, Style included
5242 Anth beardless, Leaves 3 lanceolate smooth, Fl umbelled surrounded by colored bractes
5243 Anthers crested, Leaves 3 mucronate smooth with a white edge, Sepals lanceolate, Flowers terminal
5244 Anthers bearded, Leaves 3 oval imbricated, Flowers capitate
5245 Anthers bearded, Leaves 3 smooth, Cor campanulate, Style included, Flowers 3 sessile
5246 Anthers bearded, Leaves 4, Appendages subulate pectinate longer than the anther
5247 Anthers bearded, Style included, Cor ovate 4-cornered, Fl terminal 3, Leaves 3 or 4, Stem pubescent
5248 Leaves long ciliated spreading, Fl axill. Cor cylindrical, Cal. with keeled sepals
5249 Anth bearded included, Style included, Cor campan Fl axill nodding, Leaves 3 imbricated 6 ways
5250 Anth. beardless exserted, Style exserted, Cor campan Fl terminal capitate, Leaves 4-incurved ciliated
5251 Anth beardless included, Cor and calyx scarlet, Leaves opposite
5252 Anth beardless, Cor flat, Tube globose, Style exserted, Leaves 3
5253 Anth beardless included, Cor ovate, Flowers in umbelled corymbs, Lvs 3 triangular cartilagin at edge
5254 Anthers beardless exserted, Style exserted, Cor. campanulate, Flowers 3 terminal, Lvs 3 lanc. smooth
5255 Anthers beardless exserted, Cor campanulate, Cal imbricated, Style exserted, Leaves 3
5256 Anthers much exserted beardless, Cor campanulate length of the very hairy calyx, Leaves spreading
5257 Anthers much exserted beardless, Cor campanulate longer than the very hairy calyx, Leaves erect
5258 Anthers beardless included, Cor. globose campan Cal woolly, Flowers sessile, Lvs 3 lin obtuse villous
5259 Anthers beardless included, Leaves broadish, Fl terminal, Cal imbricated
5260 Anthers beardless included, Leaves 3 lines long, Fl capitate, Cal ciliated
5261 Anthers beardless of middle length, Cor campan longer than cal Style exserted, Leaves 3
5262 Leaves 4 hairy, Fl capitate, Sepals and bractes very hairy, Cor globose, Anthers beardless exserted
5263 Anthers beardless exserted, Style exserted, Cor. campan Leaves 3 imbricated in 6 rows
5264 Anthers beardless, Leaves linear 3 smooth, Limb of cor revolute
5265 Anthers beardless, Leaves appressed, Fl capitate, Cor limbate
5266 Leaves 2 channelled, Fl term on short stalks, Sepals ovate acute, Anth included crested
5267 Anth beardless included, Cor 3, Style exserted, Leaves 3
5268 Anthers bearded, Leaves opposite sagittate

5269 Anth crested, Leaves 3 erect spreading much longer than joints glaucous, Bractes remote from calyx
5270 Leaves wedge-shaped, Cal. ovate cuneate, Cor 4-cornered spherical, Anthers bearded
5271 Anth crested, Leaves 3 ciliated, Cal imbricated, Style exserted
5272 Anth crested, Leaves 3 smooth, Cal imbricated, Style exserted
5273 Anth crested, Leaves 4
5274 Anth crested, Leaves opp appressed, Cal large cup-shaped, Sepals rounded mucronate
5275 Anth beardless, Leaves 3, Bractes remote, Cor campan
5276 Anth beardless, Leaves and flowers 4
5277 Anth. beardless, Leaves 4, Flowers 8
5278 Anth crested, Cor ovate covered, Style included, Leaves 3, Stigma 4-parted
5279 Anth beardless, Leaves opposite imbricated appressed, Umbels terminal many-flowered

E. GLOBOSÆ. *Corolla small, globose*

5280 Cor globose, Anth crested, Two bractes next the calyx, the third remote
5281 Cor globose, Anth crested, All bractes close to calyx
5282 Cor globose, Anth crested, Bractes remote from cal Leaves glandular at edge, Sepals ovate
5283 Anthers bearded, Cor campanulate, Style included, Leaves 3, Flowers scattered
5284 Anth. bearded, Style exserted, Cor camp globose, Leaves 3 or 4 roughish, Branches pubescent

5285 Cor globose glutinous, Anth crested, Bractes remote, Leaves roughish
5286 Cor globose, Leaves quite smooth, Anth crested
5287 Anth crested, Leaves 3 ovate smooth, Flowers umbelled ovate, Cal entire, Branches villous
5288 Anth crested, Leaves 3 linear smooth, Fl umbelled globose, Cal lanceolate short, Branches smooth
5289 Leaves 3 or 4 spreading finely ciliated, Fl terminal, Bractes remote, Sepals ovate, Anth included crested
5290 Anth beardless, Leaves 3 triangular smooth, Fl racemose globose, Branches downy
5291 Anth crested, Style exserted, Cor. globose campanulate, Fl terminal umbelled, Leaves 4 smooth erect
5292 Anth. crested, Style included, Cor ovate, Umb many-fl. terminal, Leaves 4 or 5, Branches pendulous
5293 Anth bearded, Cor globose camp Cal appressed ciliated, Fl term and axill 1-sided, Lvs 4 horizontal
5294 Anth bearded, Style exserted, Cor campanulate, Fl whorled, Leaves 6 linear hairy
5295 Anth. beardless exserted, Cor campanulate, Fl term capitate, Leaves 4 incurved ciliated



and Miscellaneous Particulars.

The climate for the heaths is not required to be warm during winter; if the frost is excluded, that will be enough Some species, as the E. persoluta for example, will even bear to have the ground about their roots frozen without injury, provided it is not thawed in the sun, or too suddenly, or in a very warm temperature. In general the heaths may be kept in the coldest part of the greenhouse, and those not in flower in pits, well covered at night with mats or prepared coverings of reeds or straw. Too much fire-heat in winter will hurt them as much as any thing, as they only require to be kept from frost most of the kinds might be preserved through the winter in frames the only difficulty is to keep the damp from them.

Heaths require a great deal of air and light, and therefore should be placed near the glass and near such

History, Use, Propagation, Culture,

glass as may be opened to admit air every mild day in the year. They require also very regular supplies of water, not much at a time, but so frequently that the earth may never get dry or the plant droop Many kinds of plants, if they have suffered for want of water, may be recovered by an abundant supply, and placing them under a bell-glass on a little heat, but if once the roots of a heath are thoroughly dried, no art of the gardener will recover the plant. This is the true reason why so many heaths are destroyed when introduced as chamber plants, and also by gardeners who are ignorant of their nature

Heaths are propagated by cuttings, seeds, and a few by layers. In propagating by cuttings, the tender tops are taken at whatever season of the year they begin to grow, which with most sorts is about the month of June. The strong growing kinds require the cuttings to be rather larger than the others, and some of the stunted growing kinds should be kept in the hot-house a little while when they begin to grow, to draw them to a sufficient length of young wood, or cuttings cannot be procured Then take the extreme points of the shoots, and with a sharp penknife cut off their lower ends at right angles, placing the cutting on the nail of the thumb, as in cutting the nib of a pen The cutting will be from three quarters to an inch long: strip off the leaves from the lower end to nearly half the length of the cutting, and, in order that this may be done

5296 Anth. bearded exserted, Cor. campanulate, Leaves 3 or 4 ovate acute fringed with glands
5297 Leaves 3 ovate, Fl very minute 3-6 term Style long exserted
5298 Anth bearded, Cor. ovate conical, Style middling, Leaves 3 ovate pubescent white beneath
5299 Anth beardless included, Cor. roundish, Leaves 3 ovate acute ciliated, Stem hispid
5300 Shoots long, Leaves smooth erect imbricated, Fl axillary, Cor. globose shorter than stalk nodding
5301 Tube of cor cup-shaped, Fl axillary, Cal. imbric Leaves 4
5302 Leaves 3 spreading acerose, Cor campanulate rough with short hairs
5303 Bractes remote, Cor with a short open limb, Anth included bearded
5304 Flowers capitate, Bractes remote, Cor hairy, Anth included bearded

5305 Leaves hairy, Flowers capitate, Anth included bearded
5306 Bractes remote, Flowers very abundant, Anth included bearded, Style exserted

5307 Leaves 3 ovate ciliated spreading, Fl term 3, Bractes remote, Cor ovate shorter than its stalk
5308 Anth bearded, Style included, Cor. camp Cal villous, Fl. axill. whorled, Leaves 4 imbric villous

5309 Anth included bearded, Fl capitate, Bractes remote
5310 Leaves 3 narrow spreading, Cor 4 globose campanulate [quite smooth
5311 Anth bearded, Style exserted, Cor camp Sepals linear smooth, Fl terminal umbelled, Leaves 4, Stem
5312 Branches slender upright, Leaves 3 short smooth, Fl clustered terminal, Cor globose campanulate
5313 Anth bearded, Style included, Cor camp Sepals ciliated, Leaves 3-4 smooth, Branches pubescent
5314 Leaves 2 spreading very narrow, Leaves 3 terminal, Cor globose smooth
5315 Anth bearded, Style included, Cor ovate pubescent, Leaves 3 hairy, Stem hairy
5316 Anth. bearded, Leaves 4 or more hairy, Fl terminal, Cor pubescent

5317 Leaves 4 covered with glandular hairs, Fl capitate, Bractes none, Cal hairy, Anth included bearded
5318 Anth bearded, Cor globose mucous, Ped 3 term longer than fl Leaves 4 linear with a cartil serrul edge
5319 Anth crested, Style included, Cor globose, Fl umb Leaves 4 linear 3-cornered smooth
5320 Leaves 4 and branches hairy, Fl capitate 4 or more, Cal leafy, Anth exserted bearded, Style long exserted
5321 Anth beardless, Bractes remote
5322 Anth beardless, Leaves linear 3 smooth, Limb of cor revolute

5323 Leaves 3 short smooth, Fl solitary term Cor. ovate smooth, Anth a little exserted
5324 Anth beardless, Leaves 4 lanceolate villous, Fl racemose, Cal downy
5325 Anth. beardless included, Cor ovate campanulate, Style exserted, Stigma funnel-form, Leaves 3
5326 Anth. beardless, Leaves 3 linear smooth, Fl camp racemose, Bractes remote
5327 Anth beardless, Leaves linear 3 smooth, Limb of cor spreading recurved
5328 Anth beardless, Leaves linear 3 smooth, Limb of cor erect
5329 Anth beardless exserted, Leaves 3 ciliated at base, Fl term 3, Sepals scarious
5330 Anth beardless included, Stigma calyptcate, Cor dilated upwards, Bractes remote
5331 Anth beardless exserted, Leaves 3 smooth, Fl term Style exsert. Stigma peltate
5332 Anth beardless, Leaves linear 4 smooth, Flowers terminal nearly 12
5333 Anth beardl exsert Cor urceol smooth, Fl term umb Leaves 3 pointed ciliated imbricated

5334 Anth beardless exserted, Fl urceolate villous, Leaves 3 revolute villous
5335 Anth beardless exserted, Fl cernuous turban-shaped covered by calyx, Leaves 3
5336 Leaves 3 or 4, Fl terminal 2, Cor downy changing from green to crimson
5337 Anth crested, Cor ovate viscid, Fl term umb Leaves scattered arcuate truncate
5338 Leaves 3 erect imbricated smooth, Fl axill Cor urceolate, Style exserted
5339 Anth beardless included, Fl axillary spiked, Cor campan ribbed, Leaves 6 obtuse
5340 Anth beardless, Leaves 3 ovate villous
5341 Anth beardless, Leaves 3, Cal 4-cleft very densely downy
5342 Anth beardless, Leaves 3 hispid, Sepals hairy upwards, Cor smooth
5343 Anth bearded included, Cor very small obov obt smooth, Fl umb erect and cernuous, Lvs 3-4 smooth
5344 Leaves two distant, Fl numerous very minute globose campanulate, Style exserted

and Miscellaneous Particulars

without injuring the shoot, use a sharp penknife or a pair of small scissors, for the least bruise or wound spoils the cutting This done, dibble the cuttings into pots filled with moistened white sand from pits, or with any small sand from pits or rivers, or, in default of that, with powdered sandstone When they are all planted, water the whole to fix them still better, and when the moisture has subsided, cover them with a small crystal or greenish crystal bell-glass fitted within the rim of the pot, and place them in the shade on a spent hot-bed, keeping them quite close till rooted The free-striking sorts will have roots in two months, and the others at different periods from three to twelve months, most of them will be ready for transplanting into pots of the smallest size in the following March Their rooting is easily known by their beginning to shoot, and then the bell should be taken off an hour or two daily

Many Ericas ripen their seeds in this country, and of other sorts seeds are regularly obtained by the nurserymen from the collectors at the Cape of Good Hope Imported seeds generally arrive in the winter, and should be sown early in the spring following, in pots filled with equal parts of peat and sand well incorporated, the seeds should be thinly covered with earth gently pressed down, and bell-glasses placed over them as over the cuttings. The soil must be kept moderately moist by gentle waterings, and in about six or seven weeks

History, Use, Propagation, Culture,

the seeds, if fresh, will begin to come up, when the glasses may be removed by degrees, and the pots kept near the glass, and shaded from the mid-day sun till autumn, when they may be transplanted into pots of the smallest size

Seeds which are saved in this country may be sown as soon as gathered, if they ripen before November; but if after that period, it will be better to preserve them till spring, and then treat them like foreign seeds

Only a few heaths are propagated by layers, such as E. Massoni, retorta, petiolata, and one or two other delicate sorts, which when layed require two years to throw out roots On the continent most sorts of heaths are propagated by layers, because there they are ignorant of the easiest mode of managing cuttings.

One of the best growers of heaths in Britain is a gardener of the name of Henderson, at Woodhall, in West Lothian. This judicious cultivator has had an extensive collection of Ericæ for upwards of thirty years under his care, and has given some account of his mode of management in a late volume (vol. iii p. 323.)

F OVATÆ. *Corollas small, not globose.*

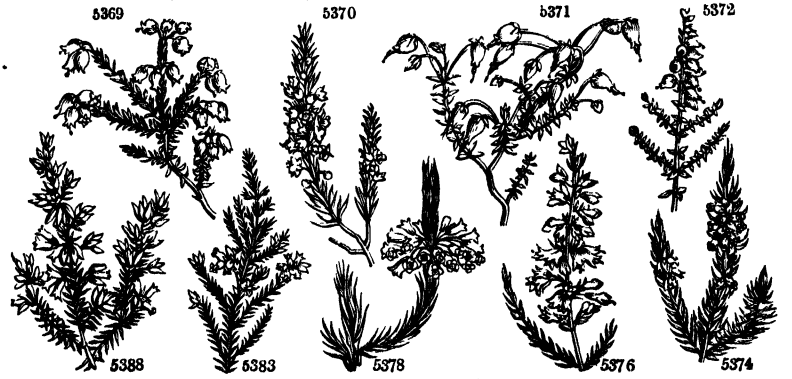
5345 Anthers crested, Cor. cylindrical, Style exserted, Leaves 3 spreading
5346 Anthers crested, Cor ovate, Leaves 3, Stigma capitate

5347 Anth. bearded, Style included, Cor ovate, Fl. term umbelled, Leaves 4 lin. horizontal
5348 Anth crested included, Leaves 3 recurved rough at edge, Cal short, Cor. campanulate viscid
5349 Anth crested, Leaves 4 ovate ciliated, Fl capitate, Cal. ciliated
5350 Anth. crested, Leaves 4 lanc. erect smooth, Fl capitate cernuous
5351 Anth crested included, Fl capitate, Leaves 3 or 4 lines long
5352 Anth crested, Cor. ovate, Style included, Leaves 4 ciliated, Fl capitate

5353 Very like E. cinerea, but the branches and calyx are downy with long hairs, Leaves 5 ciliated
5354 Anth. bearded, Cor ovate-conical villous, Style included, Sepals lanceolate, Fl umb Leaves 3
5355 Anth beardless included, Cor camp acute, Style included, Cal 4 cornered, Leaves 4 spreading
5356 Anth bearded included, Leaves 4 spreading hairy, Cor. dilated at end, Fl terminal
5357 Anth beardless exsert Style exsert Leaves 3, Branches downy
5358 Anth. bearded included, Leaves obtuse hairy, Fl capitate, Bractes remote, Cor silky

5359 Anth bearded, Cor ovate, Style included, Cal acute, Fl racemose
5360 Anth. bearded included, Style included, Cor slender, Leaves 4 obtuse glandular, Fl capitate
5361 Anth crested included, Cor prismatical, Leaves 3, Fl in bundles, Bractes many imbric involving the fl
5362 Anth beardless nearly exserted, Leaves 4 spreading hairy, Fl terminal umbelled, Sepals ovate
5363 Anthers beardless exserted, Cor oval twice as long as smooth calyx

5364 Anthers beardless exserted, Cor campan Style exserted, Leaves 3 acerose
5365 Anth exserted, Fl axill Leaves linear 3, Filam very long reflexed
5366 Anth exserted, Fl axill Leaves 3 ovate
5367 Anth exserted, Fl. axill Leaves linear 3 or 4, Bractes in middle of flower stalks, Cor conical



5368 Anth exserted, Fl axill Leaves 4-5, Bractes above the middle of flower-stalk, Cor urceolate
5369 Leaves short spreading, Fl terminal urceolate, Style a little spreading
5370 Anth exserted, Fl axill. Leaves 4-5, Cor campanulate, Pedunc the length of cor.

5371 Anth and style much exserted, Flowers axillary on very long slender hairy stalks
5372 Cor conical, Leaves 3 ovate ciliated, Anth beardless
5373 Plant all over hairy, Cor ovate, Sepals brown at end, Stamens and style exserted
5374 Cor. conical, Leaves 3 linear smooth, Anth beardless
5375 Cor cylindrical, Fl term Bractes remote, Anth beardless, Sepals ovate
5376 Cor cylind dilated upwards, Fl term Bractes remote, Anth beardless, Sepals subul from a broad base
5377 Cor. cylindrical dilated upwards, Fl axill Two bractes next cal Sepals ovate oblong
5378 Cor cylindrical dilated upwards, Fl axill Sepals subulate, Peduncles longer than flower
5379 Cor cylindrical dilated upwards, Fl axill Sepals subulate, Peduncles much shorter than flower
5380 Cor cylindrical dilated upwards, Fl axill Sepals linear
5381 Cor. conical, Anth. beardless, Leaves 4, Limb of cor erect

5382 Anth beardless, Leaves linear 4 smooth, Fl terminal 4
5383 Anth beardless included, Fl term Bractes remote, Cor narrowed upwards
5384 Leaves 3, Anthers beardless exserted, Flowers terminal
5385 Anth exserted, Fl axill Bractes remote, Leaves lin 5, Cor camp Limb reflex Ped twice as long as cor
5386 Cor cylindrical, Fl term Bractes remote, Anth bearded

5387 Stem spread on the ground, Leaves obtuse, Cor dewy outside clavate, Anth bearded
5388 Anth beardless included, Cor linear downy, Leaves downy 4
5389 Anth. crested, Leaves 3 ovate entire smooth, Fl umb furrowed, Cal. spreading entire

5390 Anth. bearded, Style included, Cor globose, Cal villous reflexed, Fl term umbelled, Leaves 4 hairy

and Miscellaneous Particulars

of the Caledonian Horticultural Society's Memoirs. He keeps his Ericas, he says, "at all times cool and airy, opening the glasses in winter when there is no frost, and letting the wind blow on them, and using no fire but in time of frost" "Never," he says, "shift any plant till the pot is quite full of roots. When the plants get large, several of them will continue in good health for three or four years without shifting, and flower well I have plants of E retorta here, in pots seven inches in diameter, which are very bushy, being eighteen inches across, and fourteen inches high above the pot, E. infundibuliformis, two feet and a half in diameter, and two feet nine inches high; Erica pilosa between five and six feet high and three feet across, in pots eleven inches in diameter: these have not been shifted for five years, and are in high health, and covered with strong fine flowers from the mouth of the pot to the top of the plant" (*Caled Mem* iii 327)

"A prejudice," Page observes, "having spread that the culture of heaths is difficult, one of the greatest ornaments of the greenhouse has hence of late been neglected, although the method of culture is as easy and nearly as certain as that of the Geranium, but requiring a little more delicacy in the execution"

History, Use, Propagation, Culture,

(*Prodromus*, &c art *Erica*) Those who complain of the difficulty of growing the heath, are often, as Loddiges remarks, ignorant people who have never had a heath to grow

One circumstance in favor of the culture of heaths is, that they are not subject to insects, or at least very rarely so (*Greenhouse Companion*, p 62)

The number of species is here reduced to those which are certainly different from each other. Of those enumerated in garden catalogues many are mere repetitions of each other

893 *Menziesia* Named in honor of Mr Archibald Menzies, an assiduous and successful botanist, who accompanied Vancouver, in the capacity of his surgeon, in his voyage round the world He is still living, and the ornament of the private circle in which he moves Small heath-like plants, all hardy, and requiring the same cultivation as Erica.

894 *Chlora* From χλωρος, green, in allusion to the color of the dried flower of C perfoliata. The whole plant dyes yellow.

895 *Michauxia.* In memory of Andrew Michaux, botanist to the king of France, who travelled into Syria,

5391 Anth. crested included, Flowers capitate campan. cernuous, Leaves 4 cernuous
5392 Anth. crested included, Fl. 3, Leaves 4 subulate erect mucronate
5393 Anth. bearded, Cor campan. Fl whorled, Leaves 6 hairy spiral
5394 Leaves narrow, Cal recurved horizontal, Cor. globose with segm. imbricated at base
5395 Anth. crested, Leaves 3 lanceolate rough, Fl 3, Cal ciliated reflexed

5396 Anth. crested included, Cor. urceolate hairy, Fl. umbelled, Leaves 4 ovate
5397 Anth. bearded included, Cor globose much less than colored calyx, Leaves 3 with a membranous edge

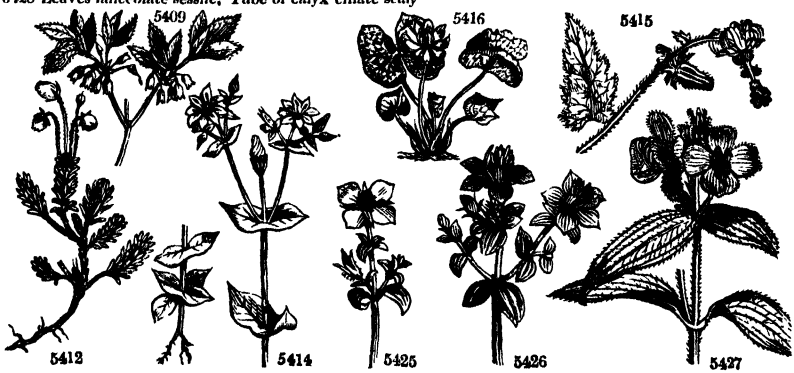
5398 Anth 2 horned included, Cor axill solitary, Leaves 3 ovate cordate ciliated
5399 Anth bearded included, Style exserted, Cor camp smooth, Fl. term sol Leaves 3 lin Branches hairy
5400 Anth. bearded, Leaves 3 linear hispid, Fl. umbelled, Cal rough
5401 Anth bearded, Cor camp smooth, Leaves 4 pubescent ciliated
5402 Cal 4-cleft, Cor linear smooth urceolate with a recurved limb, Capsule hairy
5403 Anth bearded included, Flowers racemose, Leaves 6 clustered
5404 Anth bearded, Leaves 4 ciliated, Fl umb Cal navicular ciliated at end
5405 Anth bearded perforated, Leaves 4, Stem angular downy, Cor narrow obovate
5406 Anth. bearded, Leaves 4, Cal. appressed, Cor linear pubes. with a very short recurved limb, Caps hairy

5407 Anth bearded, Leaves 4, Cal. appressed, Cor linear pubescent, Capsule smooth [smooth
5408 Anth bearded, Leaves 4, Cal appressed, Cor linear pubes with an oval tube and very short limb, Caps.

5409 Leaves obov lanc. beneath, beyond the nerves smooth, Cal 4-cleft, Fl urceol 8-androus
5410 Leaves pubescent beneath, Calyx 4-fid, Cor with a globose tube
5411 Leaves oval pubescent, Fl term aggregate nodding
5412 Leaves beneath densely downy, Cal. 4-parted, Tube of cor oval

5413 Leaves linear obtuse with cartilaginous teeth, Flowers 5-cleft decandrous

5414 Leaves perfoliate



5415 The only species

5416 The only species

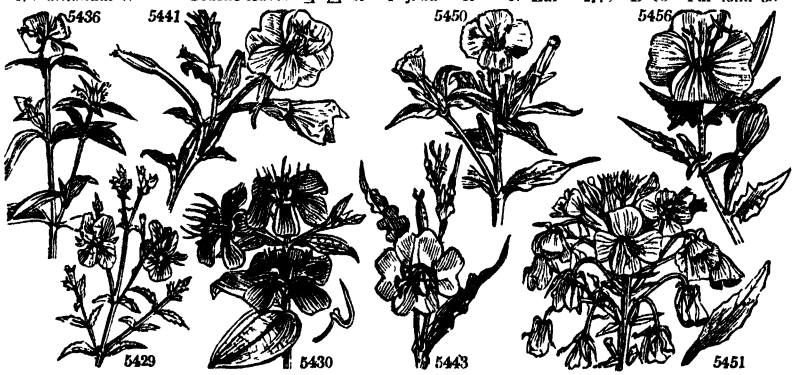
5417 Leaves obovate oblong viscous, Fl racemose, Fruit with 2 or 3 wings longer than stalk
5418 Leaves lanc narrowed at both ends viscid, Racemes branched, Fruit always with 2 wings length of stalk
5419 Leaves obl mucronate entire, Fl term sessile
5420 Leaves lanceolate narrowed at each end, Branches 3-cornered, Fruit with narrow wings
5421 Leaves oblong lanceolate with revolute edge, rather clammy, Flowers in short racemes

5422 Unarmed, Leaves subsessile ovate acute at each end
5423 Branches spiny
5424 Leaves subsessile lanceolate with terminal corymbs of flowers

5425 Leaves stalked, Calyx hispid
5426 Leaves sessile, Calyx smooth
5427 Leaves lanc obl acumin 5 nerved and branches hispid, Cal. covered with entangled radiate hairs
5428 Leaves lanceolate sessile, Tube of calyx ciliate scaly

and Miscellaneous Particulars.

Persia, and North America, and discovered this his genus It is a handsome biennial, which bears a profusion of shewy flowers bearing some distant resemblance to those of the Passion-flower



896. *Jeffersonia.* Named after Mr Jefferson, the celebrated President of the United States. A very curious plant, remarkable for the peculiar mode of dehiscence of its capsule.

897 *Dodonæa.* So named in honor of Rambert Dodoens, professor of medicine, a famous botanist of the sixteenth century, author of Fragum Historia, 1552; and Pemptades, 1583. He was born at Malines, in 1518, and died in 1585 The species are ugly tropical shrubs, of neither use nor beauty

898 *Lawsonia.* In memory of Isaac Lawson, M D author of A New Voyage to Carolina, London, 1709 L. inermis is the Henna plant, with the leaves of which the Egyptian women dye their nails pink It is of easy culture and propagation

899. *Osbeckia.* So named by Linnæus, in honor of Peter Osbeck, a Swedish clergyman, member of the academy of Stockholm, and of the society of Upsal: author of a voyage to China and the East Indies, in 1751. Englished by Forster, in 1771. Little plants resembling Melastoma. Young cuttings strike freely under a hand-glass.

History, Use, Propagation, Culture,

900. *Rhexia* A Greek name employed by Pliny to designate a Boragineous plant It is derived from *ῥῆσσω*, to burst, that is to say, good against ruptures The hardy species thrive best in a bed of peat, or they will grow very well in pots

901. *Œnothera* Derived from *οἶνος*, wine, and *θηρεύω*, to hunt The roots of this plant, O biennis, eaten after meals, are incentives to wine-drinking, as olives are This is an ornamental genus of easy culture in light rich soil, and they increase either by seeds or cuttings O. biennis is called the night primrose, because the flowers usually open between six and seven o'clock in the evening The mode of their expanding is curious. The petals are held together at top by the hooks at the end of the calyx, the segments of which first separate at bottom and discover the corolla, a long time before it acquires sufficient expansive force to unhook the calyx at top, when it has accomplished this, it expands very fast, almost instantaneously, to a certain point, and then makes a stop, taking a little time to spread out quite flat: it may be half an hour from the first bursting of the calyx at bottom to the final expansion of the corolla, which commonly becomes flaccid in the course of the next day, sooner or later according to the heat or coolness of the weather. The

5429 Lvs. sess. lanc. 3-nerved villous ciliated, Cal stellate hairy
5430 Leaves ovate lanc 5-nerved hairy on each side, Panic term loosely many-fl.
5431 Leaves finely hispid at edge, Stem quadrangular smooth, Flowers solitary in an involucre
5432 Decandrous, Lvs. sessile smooth ovate obtuse 3-nerved, Caps 2-valved
5433 Lvs sessile lanceolate 3-nerved serrate ciliated, Cal. glandular ciliated
5434 Lvs opp cordate crenulate hairy, Pan term. trichotomous, Branches filiform much spreading
5435 Leaves cordate oval silky on each side 7-nerved sessile, Pan term Flowers with bractes 10-andr.
5436 Lvs stalked ovate entire 3-nerved villous, Fl terminal clustered

5437 Lvs ovate-lanceolate flat, Stem muricated villous, Stamens shorter than cor.
5438 Lvs ovate-lanceolate, Stamens declinate, Stem shrubby
5439 Lvs ovate-lanceolate flat, Stem smooth subvillous, Stamens longer than cor.
5440 Lvs lanc flat, Stem purp muricated, Stamens length of cor.
5441 Lvs toothletted, Stems simple hairy, Petals distant 2-lobed
5442 Lvs lanceolate wavy
5443 Lvs linear lanceolate toothletted wavy pubescent glaucous, Stem hairy
5444 Lvs lanc repand toothed pubescent, Stem rounded pubescent
5445 Lvs lanc. villous, Stem angular hairy
5446 Lvs sublinear toothletted, Caps cylindr very narrow toothed
5447 Lvs lanceol somewhat toothed acute, Caps stalked obl clavate angular
5448 Lvs lanc entire obtuse, Caps somewhat stalked ellipt ovate angular
5449 Lvs ovate narrowed at each end toothed, lower lyrate, Caps stalked obovate angular
5450 Lvs. glaucous smooth lanceolate entire, Caps. sessile ovate angular

5451 Stem upright hispid furrowed, Leaves lanc repand toothletted, Caps sess angular cylindrical
5452 Stem muricated, Lower lvs linear very long toothletted, cauline lanceolate
5453 Stem erect pubescent, Lvs lanc lin soft pubescent, Caps obl rounded sessile
5454 Pubescent, Lvs lin lanc acute at each end entire, Fl term aggregate, Caps clavate 4-cornered
5455 Lvs toothed sinuated, Caps prismatical
5456 Lvs lanc. pinnatifid at base, Caps obovate with 4 wings
5457 Lvs lanc cut-toothed, Caps obl sessile, Tube of cal very long, Pet 2-lobed
5458 Stem branched, Lvs lanc stalked with distant glandular teeth, Caps ellipt 4-winged on short stalks
5459 Leaves broad-oval repand toothed lævigated glaucous, Caps ovate 4-cornered
5460 Stem simple below, Leaves ovate stalked glandular toothletted, Racemes leafy, Caps obovate 4-cornered
5461 Lower leaves oblong, upper linear, Caps cylindrical straight, Petals crenulate
5462 Leaves pinnatifid, with the terminal segment large and toothletted
5463 Leaves linear obovate, Caps cylindrical curved
5464 Downy, Leaves oblong lanc toothed subpinnatifid, Raceme naked, Caps obovate angular
5465 Leaves lyrate and lanceolate toothed, Caps stalked clavate
5466 Hairy, Leaves lanc toothletted, Caps axillary curved angular acute
5467 Very like Œnothera acaulis, from which it is chiefly distinguished by its yellow flowers
5468 Finely pubescent, Stem and nerves of leaves white, Leaves pinnatifid, Fl spiked

5469 Leaves lanc toothed, Pet obovate ascending spreading, Style and stamens declinate
5470 Leaves lin lanc toothletted, Spike close, Petals as long as cal. Stigma entire
5471 Leaves lin lanc toothletted, Style and stamens straight
5472 Leaves ovate toothed, Pet ovate acute cruciate, Style and stamens straight
5475 Leaves lin lanc. deeply toothed, Pet 3 ascending, Stamens 6 declinate

5474 Leaves scattered lin lanc entire veiny, Fl unequal
5475 Leaves scattered lin obsoletely toothletted veinless, Petals unequal entire
5476 Leaves altern and opposite lanc. ovate nearly entire pubescent veinless, Fl. unequal

and Miscellaneous Particulars

uppermost flowers come out first in June, the stalk keeps continually advancing in height, and there is a constant succession of flowers, till late in autumn The roots are eaten in some countries in the spring

O longiflora has flowers uncommonly large and shewy, which continue from July to October

The dwart North American herbaceous kinds, are among the most beautiful plants of our borders

902 *Gaura* A very curious genus, so called from γαυρος, superb. Its flowers are rose colored, in fine terminal spikes. Plants with the habit of Œnothera, and requiring the same management

903 *Epilobium* From επι, upon, and λοβος, a pod; that is to say, a flower growing upon a pod E. angustifolium is a native of most parts of Europe, from Lapland to Italy It is valuable in shrubberies as thriving under the drip of trees, and succeeds every where, even in the smoke of cities, and in parks it is a good plant to adorn pieces of water, being hardy, of rapid increase, not much relished by cattle, and very shewy when in flower According to Haller, the young shoots are eatable, although an infusion of the plant stupifies, the pith when dried, is boiled, and becoming sweet, is by a proper process made into ale, and this into vinegar by the Kamtschatdales, it is also added to the cow-parsnip, to enrich the spirit that is prepared

History, Use, Propagation, Culture,

from that plant, as fodder, goats are said to be extremely fond of it, and cows and sheep to eat it; the down of the seeds mixed with cotton or fur has been manufactured into stockings and other articles of clothing

E. hirsutum is found only in rich moist soil by water The leaves smell like scalded codlings or gooseberry pye when green, but lose that odor when dry Cattle are rather fond of the plant both recent and dried

904 *Fuchsia* So named in honor of Leonard Fuchs, a famous German botanist, author of Historia Stirpium, in 1542, with 516 excellent engravings in wood. F coccinea is one of the most elegant of deciduous greenhouse shrubs; the young wood and nerves of the leaves are tinged with purplish red: the pendent blossoms, like most produced from the axils of the leaves, as the shoots grow, continue during the greater part of the growing season, and are succeeded as they fade by a purple berry. The finest specimen in England of this species is at Salt-Hill

Many other species have been lately introduced, some of which will probably be very handsome. South America contains some most splendid species, of which we know nothing in this country

905 *Jambolifera.* From *fero*, to bear, and *Jambol*, the name of a Malabar fruit. Cuttings strike freely in sand under a hand-glass

906. *Oxycoccus* From ὀξυς, acid, and κοκκος, fruit, on account of its acidity A genus well distinguished from Vaccinium, by the narrow revolute segments of corolla These are pretty little trailing evergreen plants, to which a peat soil and rather a moist situation are absolutely necessary · they are very little changed by culture.

O palustris bears edible berries which are gathered wild both in England and Scotland, and made into tarts Lightfoot says, twenty or thirty pounds worth are sold each market day, for five or six weeks together,

5477 Leaves opp and altern subamplexicaul ovate-lanceolate hairy, Stem much branched hairy
5478 Leaves sessile lanc pubescent, Stem simple villous, Root fibrous
5479 Leaves altern lanceolate serrated hairy
5480 Leaves opp ovate toothed
5481 Leaves stalked ovate acute toothed, Stem erect branched square, Petals bifid

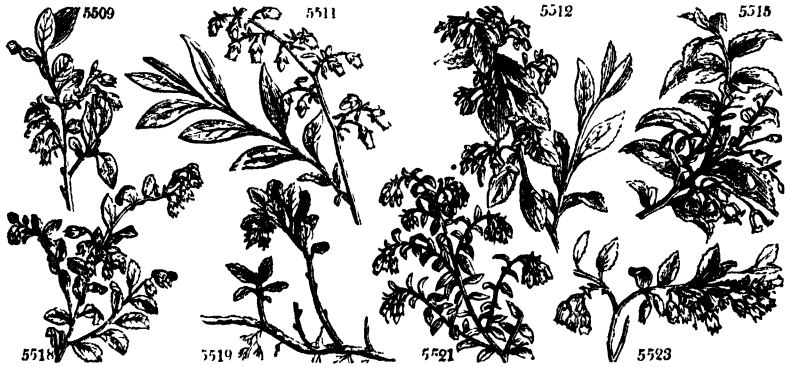
and Miscellaneous Particulars



in the town of Langtown, on the borders of Cumberland The plant might no doubt be cultivated with equal ease as the American species

O macrocarpus furnishes the cranberries sent from America it was first cultivated in this country by Sir J Banks, on the margin of a pond (*Hort Trans* i 71), and subsequently both in moist and dry situations by different cultivators Peat earth is essential to every mode of culture, but a much less degree of moisture will do than was at first believed Salisbury found it do very well in pots of bog earth set in the shade, and Milne found "vigorous shoots and abundant crops produced on dry beds of peat earth, even in the warm summer of 1822." The American cranberry he found easier to cultivate than the common sort, but Hallet found both the cranberry and bilberry succeed perfectly under such treatment (*Hort. Trans* iv 483, and v 279

907 *Vaccinum* A name, the derivation of which is not known. Neither are commentators more decided as to what was the Vaccinium of the Latins The only conclusion to which they have come, is that the Vaccinia nigra of Virgil are the same as the μέλαν ὑακινθος of the Greeks. The species are neat little evergreen under shrubs, and inhabitants of moist alpine or subalpine regions in peat earth.

V. Myrtillus is an elegant and also a fruit-bearing plant The young fresh green leaves, and wax-like red flowers appear in May, and towards autumn the leaves grow darker and more firm, and the ripe berries are gathered in the north for tarts, and in Devonshire and Poland are eaten with clotted cream (*Fng Bot*) The berries are very acceptable to children, either eaten by themselves or with milk, or in tarts The moor-game live upon them in the autumn The juice stains paper or linen purple. Goats browse upon the plant; sheep are not fond of it, horses and cows refuse it. (*Withering*) The berries have an astringent quality, and in Arran and the Western Isles are given in diarrhœas and dysenteries with good effect. The High-

History, Use, Propagation, Culture,

landers eat them with milk, and make them into tarts and jellies, which last they mix with whisky to give it a relish to strangers

V. uliginosum grows taller than the common bilberry, and has large globular, black, glaucous fruit These have less flavor, but abound with a weak acid juice (*Eng Bot*) In large quantities it occasions giddiness, and a slight head-ache, especially when full grown and quite ripe. (*Linn. Suec* and *Withering*) Many vintners in France are said to make use of the juice to color their wines red (*Withering*) They furnish an ardent spirit which is highly volatile and intoxicating. The Alpine birds feed upon the fruit, and it is very common in their haunts (*Villars*)

V. Vitis idœa is of very humble growth and almost herbaceous, though evergreen. The berries are red, acid, astringent, and bitter They are scarcely to be eaten raw, and though made into pies in Derbyshire, where they are called cow-berries, their flavor is far inferior to the cranberry Their best use is for making a rob or jelly, which is eaten with all kinds of roast meat in Sweden, and is far preferable to that of the red currant as a sauce for venison It is also an excellent medicine in colds, sore throats, and all irritation of the mouth or fauces (*Smith, Brit* and *Eng Bot*) Linnæus says, that they are sent in large quantities from West Bothnia to Stockholm for pickling, and the same thing is confirmed by Dr Clarke. Miller was informed that this plant was used for edgings in Norway

V. tenellum is a very good fruit.

5509 Lvs. stalked obl. oval blunt entire beneath resin. Racemes lateral one-sided, Cor. ovate conical 5 angular

5532 Racemes compound erect, Flowers terminal clustered, Leaves oblong
5533 Racemes term panicled, Leaves linear lanceolate cuspidate
5534 Head terminal sessile many-flowered, Leaves scattered obl lanceol smooth
5535 Flowers fascicled term sessile, Leaves lanceol naked mucronate
5536 Flowers term subsessile, Leaves opp obl lanceol obtuse narrowed at base glabrous
5537 Flowers twin terminal sessile, Leaves elliptic lanceol smooth
5538 Flowers fascicled terminal, Leaves obovate obtuse above very smooth beneath villous

and Miscellaneous Particulars.

908 *Memecylon.* The Greek name of the fruit of the Arbutus. The shrub now so called has a certain degree of resemblance to the Arbutus Young cuttings plunged in sand in heat and covered with a hand-glass will root freely.

909. *Lagetta* This plant in Jamaica is called Lagetto Ripened cuttings will root in sand under a hand-glass

910. *Daphne.* The Greek name of the Laurel This is a genus of diminutive shrubs, mostly evergreens of great beauty and fragrance in the flower, and with a peculiar velvet texture in the leaf It is mentioned by Linnæus as a characteristic of the genus, that the terminating buds of the shoots produce leaves, and the lateral ones flowers This affords a hint to the cultivator to be sparing of his knife

D. Mezereum (*Mádzaryoûn* is the Persian name according to Richardson), *Laureole gentile*, Fr., *Kellerhals*, Ger., and *Laureola femina*, Ital., is an old inhabitant of the shrubbery, and deservedly much admired for its precocity and fragrance It thrives well in loamy soil, and will grow in the shade and even drip of other trees It is a native of all parts of Europe from Lapland to Sicily, but was first received from Elbing before it was observed to be a native The roots of Mezereon acquire a very large size in proportion to the branches, and have more the character of the fusiform or ramose roots of a herbaceous, than of a ligneous vegetable They are remarkably hot and acrid, and have long and in most countries been a popular topical

History, Use, Propagation, Culture,

application for the toothach The whole plant is extremely acrid, especially when *fresh*, and if retained in the mouth excites great heat and inflammation, particularly of the throat and fauces The berries when swallowed prove a powerful poison, not only to man, but to many quadrupeds Both the bark and the berries of Mezereon in different forms have been long used externally in cases of obstinate ulcers and ill-conditioned sores In France the bark is used as an application to the skin, which, under certain management, produces a serous discharge without blistering, and is thus rendered useful in chronic cases of a local nature, answering the purpose of what is called a perpetual blister, while it occasions less pain and inconvenience. In our own country the Mezereon has been principally employed in syphilitic cases. The branches make a good yellow dye.

D Laureola is valuable in the shrubbery as thriving under the shade and drip of other trees, and never growing to an unshapely size and figure, and in the nursery as affording stocks for the more rare species. The roots and other parts of the plant possess similar qualities to those of the Mezereon.

911 *Dirca.* From δίειμι, a fountain A plant which grows in watery places *Bois de Plomb*, Fr This shrub grows in hilly swamps in North America it is in all its parts remarkably tough, and the twigs are in consequence used for rods, and the bark for ropes, baskets, &c. Layers are generally two years in rooting; cuttings do not succeed, and it does not ripen seeds here Snails, Sweet observes, are particularly fond of this plant.

912. *Gnidia.* One of the names given by the ancients to the Daphne. These plants "thrive well in a sandy peat soil, with their pots well drained with broken potsherds care must be taken not to over water them, or to let them flag for want of water, as their roots are very tender and are easily killed; the tenderest kinds are G oppositifolia, and G pinifolia (*Bot Cult* p 198.)

5539 The only species Flowers appearing before the leaves

5540 Leaves scattered 3-cornered, Flowers in umbellate heads, Scales four bearded
5541 Leaves scattered 3-quetrous linear acute floral lin lanc shorter than heads, Scales eight beardless
5542 Leaves all linear acute, Flowers terminal sessile, Scales four and cor smooth
5543 Leaves scattered lanc smooth, Flowers capitate surrounded by bractes, Peduncle naked
5544 Leaves opp lanceolate tomentose, Flowers terminal, Scales 4
5545 Leaves opp ovate tomentose, Flowers terminal, Scales 8
5546 Leaves ovate oblong imbricated hairy with naked nerves
5547 Leaves opp. ovate smooth, Fl. terminal subcapitate

5548 Leaves linear, Flowers axillary sessile 4-cleft

5549 Leaves lin convex imbricated in 4 rows, Branches downy
5550 Leaves fleshy smooth outside, Stems downy
5551 Leaves linear smooth, Fl sessile in terminal filiform silky heads
5552 Leaves linear smooth, Heads stalked downy
5553 Leaves lin. opposite, Flowers term solitary, Branches smooth
5554 Quite smooth, Leaves oblong acute concave rugose outside, Fl term sessile solitary
5555 Leaves ovate villous, Flowers lateral solitary
5556 Leaves ovate scattered, Flowers capitate, Branches lax cernuous

5557 Heads clustered, Leaves loose
5558 Heads solitary woolly, Flowers imbricated in four rows
5559 Leaves opp imbricated 4 ways, Heads smooth
5560 Leaves scattered elliptical ovate, Heads woolly
5561 Leaves oval sessile very smooth, Fl capitate woolly

5562 Leaves opposite ovate acute, Racemes one-sided bracteate, Bractes shorter than peduncle, Fl. decandrous
5563 Leaves opp. oblong hairy, Racemes numerous terminal one-sided

DIGYNIA.

5564 Erect shrubby, Leaves linear fleshy

5565 Flowers loosely spiked very minute, Bractes lanceolate membranous

5566 Leaves pinnate, Leaflets obovate crenate smooth

5567 Leaves linear connate, Sepals flat the length of the stem-joints lanceol acute

and Miscellaneous Particulars.

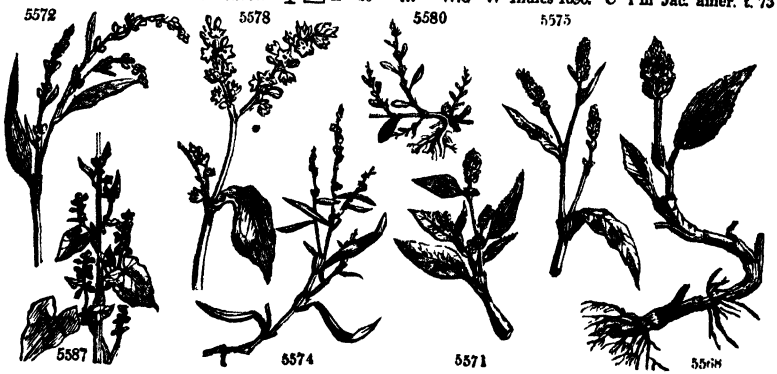
913 *Stellera.* So named by Gmelin, in memory of Georg Wilh Steller, adjunct of the academy at Petersburg, who collected plants in Kamtschatka, and died in Siberia, in 1746. An inconspicuous plant resembling the next genus and requiring the same culture

914. *Passerina* From *passer*, a sparrow Its seed has an appendage at the end like the beak of a sparrow Young cuttings root freely under a bell-glass in sand

915 *Lachnæa* Derived from λαχνη, wool, on account of the woolly heads of flowers.

916 *Combretum* A nam employed by Pliny The plant of the ancients could have no relation to the plant now called by this name, which is a genus of splendid climbing shrubs, with beautiful branches of flowers which are often crimson or purple, and sometimes white. A number of species are found at Sierra Leone. They are all stove plants

917. *Galenia.* So named by Linnæus from the famous physician Claudius Galenus, born at Pergamus, 133 years before the Christian æra. A coarse-looking shrub, with the leaves obscurely papillose or bladdery, and the stem round



918. *Aphananthe* A name contrived from α, privative, φαινω, to be remarkable, and ανθος, a flower that is to say, a plant which is not remarkable for the beauty of its flowers. A curious little Brazilian weed

919 *Weinmannia.* In honor of John William Weinmann, a German botanist, who published in 4 vols folio, his Phytanthoza Iconographica, about the middle of the last century. Handsome shrubs, with pinnated leaves.

920. *Mœhringia.* So named by Linnæus, from Paul Henry Gerard Moehring, a physician, author of Hortus Proprius, 1736. A little inconspicuous weed-like plant It suits very well for rock-work, or to be grown in small pots

History, Use, Propagation, Culture,

921. *Polygonum* From πολυς, many, and γονυ, knee, many joints These are nearly all common weeds of temperate climates P Bistorta, being one of the strongest vegetable astringents, might well be applied to the purpose of tanning leather, if it could be procured in sufficient quantity. The young shoots were formerly eaten in herb-puddings in the north of England, where the plant is known by the name of Easter Giant, and about Manchester they are substituted for greens under the name of Patience Dock. (*Curtis, Withering*) The root was formerly considered to be alexipharmic and sudorific

P. vivíparum is so named on account of the flowers frequently changing into vegetable bulbs. The roots have the same qualities as those of P. Bistorta, and are eaten in Sweden and Lapland, Siberia and Tartary.

P. amphibium is one of the most difficult weeds to eradicate from recovered alluvial lands, and has no equal in this respect unless Equisetum The roots, which in the water are properly stems, are found to a great depth in such soils, and though by fallowing or otherwise stirring the surface, the leaves may be prevented from showing themselves for several years, yet if the field be allowed to lie a year in grass, the surface will be found abounding with Polygonum. Many tracts in Scotland which have been recovered from rivers and estuaries for an unknown series of years still abound with this plant, and as under such circumstances it never advances so far as to flower and seed, the individuals must be the same which formerly were suspended in the water. As an aquatic, it has a gay, showy appearance, when in flower.

P. Hydropiper is a powerful diuretic, and will dye woollen cloth of a yellow color.

P. tinctorium, and also chinense and aviculare, are cultivated in China for dying cloth of a beautiful blue or green.

TRIGYNIA.

§ 1. *Flowers pentandrous.*

5568 Half digyn. Spike ovate, Stipules lacerate, Leaves oblong or lanceolate
5569 Flowers trigynous, Leaves lanceolate
5570 Flowers half digynous, Cor. 4-cleft unequal, Leaves ovate

5593 Leaves stalked obovate mucronulate smooth with a crisp revolute edge
5594 Stem simple one-spiked, Leaves ovate wavy running down the stalk
5595 Stem simple one-spiked, Leaves revolute lanceolate at edge
5596 Flowers trigynous racemose, Leaves lanceolate smooth, Stem divaricating spreading smooth
5597 Flowers trigynous panicled, Leaves lanceolate wavy rough above pubescent beneath
5598 Flowers trigynous racemose panicled, Leaves linear lanceolate smooth
5599 Flowers trigynous racemose-panicled, Leaves linear lanceolate smooth acuminate ciliated at edge
5600 Leaves cordate sagittate, Stem unarmed, Seeds toothed
5601 Leaves cordate sagittate, Stem unarmed, Seeds truncate at end emarginate winged
5602 Leaves cordate sagittate, Stem unarmed, Angles of seeds equal
5603 Flowers trigynous racemose-panicled, Leaves ovate lanc smooth ciliated at edge

5604 Leaves cordate roundish shining

and Miscellaneous Particulars

P orientale is a well known annual, showy, and fit for shrubberies. The seeds were first sent to Europe by Tournefort, who saw it growing in the garden of the monks of the three churches near Mount Ararat. They cultivate this plant there, not only for the beauty of the flowers, but for its medicinal qualities, which are the same with those attributed to our common species (*Mill. Fig*) The seeds are farinaceous.

P aviculare is so named from the gratefulness of its seeds to small birds, the English name, knot-grass, from the knottiness of the stem, and because it is eaten by cattle, many such plants having obtained the name of grass, though they bear no similitude to real grasses. Hogs eat it with great avidity, and hence it is known in many countries by the name of hogweed All other domestic quadrupeds are said to eat it. The seeds are useful for every purpose in which those of buckwheat are employed, but they are much smaller.

P. Fagopyrum, (*Fagus*, beech, and *συρος*, corn, its grain is like the mast of beech,) properly beechwheat, *Bled noir* or *Sarrazin*, Fr. Buckwheat is considered a native of Asia and not of Europe, though sometimes found in a seemingly wild state. It will not, however, bear the frosts of our springs or the severity of winter. In China and other countries of the East, it is cultivated as a bread corn. The flower is also used in cookery and bread-making in various parts of Europe, to make cakes and crumpets in England, and as rice or gruel in Germany and Poland. The seed is said to be excellent for horses and poultry, the flowers for bees, and the plant green for soiling cows, cattle, sheep or swine. As an agricultural plant it is valuable, as standing only a short time on the ground, but it produces little straw for manure.

922. *Coccoloba* From *κοκκος*, fruit, and *λοβος*, a lobe; the fruit has three lobes. C. uvifera is a common tree in most of the sugar colonies, generally near the sea. It is remarkable for its large leaves, and when of

a considerable size, its wood is valued for cabinet work. The berries are of the size of grapes, reddish brown or purplish without, with a thin pulp, rather astringent, and a large stone within All the species grow freely in light loamy soil, and ripened cuttings, taken off at the joint, and placed under a hand-glass, in a pot of sand, will root freely one cutting under a glass is sufficient, as the leaves must not be shortened (*Bot Cult* 41)

923 *Paullinia* So named by Linnæus, from Simon Paulli, professor of botany at Copenhagen; author of Botanicum Quadripartitum, 1640, and Flora Danica, 1648 P polyphylla affords a well known walking-stick In the woods of Jamaica it rises with a slender, woody, tough, flexile stalk, and ascends among the bushes to a considerable height When the wood is ripe it is cut down, barked, and used as riding or walking sticks

All the species succeed well in a light loamy soil, and large sized cuttings root in sand under a hand-glass

924. *Serjana* Named by Schumacher, after one Paul Serjeant Cuttings root in sand under a hand-glass

925 *Cardiospermum.* From καρδια, a heart, and σπερμα, seed, in allusion to its round seeds, which are marked with a spot like a heart The plant is remarkable for its inflated membranous capsule, from which it is sometimes called balloon vine

926. *Sapindus* A syncope of sapo-indicus, Indian soap Its fruit is covered with a pulp, which is used in America for washing linen S Saponaria bears a berry as large as a cherry, inclosing a nut of a shining black when ripe These nuts were formerly brought to England for buttons to waistcoats, some were tipped with silver, and others with different metals, they were very durable, as they do not wear, and seldom broke The skin or pulp which surrounds the nut is saponaceous, and is used in America to wash linen, but it is very apt to burn and destroy it, if often used, being of a very acrid nature

The whole plant, especially the seed-vessel, being pounded and steeped in ponds, rivulets, or creeks, is ob-

served to intoxicate and kill the fish Loureiro celebrates the berries, slightly bruised and steeped in water, as a very excellent soap; and remarks that it is only required to use them with prudence, all abstergents being in some degree corrosive

927 *Verea* So named after the late James Vere, Esq, a gentleman of fortune, who patronized gardening, and had once a fine collection of living plants The species thrive best in sandy loam, and should be plunged in the bark pit to make them flower The leaves placed on a pot of mould, or on the tan, will shoot out young plants from the notches of the margin (*Bot Cult* 35)

928 *Bryophyllum* From βρυω, to grow, and φυλλον, a leaf If the leaves are laid upon damp earth their notches push forth roots, whence proceed young plants This plant requires very little water, and the pot to be well drained it flowers best plunged in a tan heat, rich loamy soil suits it best

929 *Paris* According to some authors, this word is derived from *par*, equal, in allusion to the regularity of the parts of the plant Few plants are more readily distinguished than this, by the proportion and regularity of all the parts

The regular number is four, or some aliquot part or multiple of that number There are, however, sometimes only three leaves, and they are even said to vary from one to seven. The calyx also has sometimes three leaves The leaves and berries are said to partake of the properties of opium, and the juice of the latter to be useful in inflammations of the eyes Linnæus says, the root will vomit as well as ipecacuanha, given in a double quantity It is a suspicious plant, which has nevertheless been used in medicine in a great variety of ways

930. *Adoxa* From α, privative, and δοξα, glory — inglorious. This plant is minute, and by no means beautiful, and grows in obscure places.

931. *Elatine* From ελατη, a fir, in Greek Its fine leaves have been compared to those of a fir-tree.

travelled at the expence of the king of Denmark into Egypt and Arabia, and died in the latter country of the plague in 1763. Inelegant plants, with the aspect of a nettle.

Class IX. — ENNEANDRIA. 9 Stamens.

One of the smallest of the Linnean classes, containing, however, three important genera, the Laurel, famous for the valuable spices it produces, and for the beautiful foliage of its insipid species, the Cashew nut, well known at the tables of the great or luxurious, and the Rhubarb, one of the most valuable of medicines.

The class itself is extremely unnatural, and the assemblage of genera most incongruous.

History, Use, Propagation, Culture,

934 *Laurus* From the Celtic *blaur* (the *b* is dropped in pronunciation, *laur*), green The laurel is perpetually green This genus contains several important spice or drug-bearing trees, besides the poetical laurel and a fruit tree.

L. Cinnamomum (*qu* China Amomum) has a smooth ash-colored bark, a short erect trunk, and wide spreading branches, which form an elegant head The leaves are of a bright green above, pale beneath, and white veined, the flowers are in panicles, have no shew, and are inodorous, or perhaps somewhat fœtid, the fruit is the size of a middling olive, soft, insipid, and of a deep blue, it encloses a nut, the kernel of which germinates soon after it falls, and therefore cannot easily be transported to a distance. The timber is white, and not very solid, the root is thick and branching, and exudes abundance of camphor The inner bark forms the cinnamon of commerce There are many varieties, and probably some of them species, especially in the island of Ceylon, but only four are said to be barked. Besides Ceylon, the tree grows plentifully in Malabar, Cochin China, Sumatra, and the Eastern islands It has been cultivated in the Brazils, the Mauritius, India, Jamaica, and other places The soil in which it thrives best is nearly pure quartz sand That of the cinnamon garden near Colombo in Ceylon, was found by Dr Davy to consist of 98·5 of silicious sand, and of 1·0 only of vegetable matter in 100 parts "The garden is nearly on a level with the lake of Colombo, its situation is sheltered, the climate is remarkably damp, showers are frequent, and the temperature is high and uncommonly equable" (*Davy's Ceylon*, p 30)

The trees that grow in the valleys, in a white sandy soil, are fit to be barked when four or five years old, but those in a wet soil or in shady places, require to be seven or eight years of age The bark is good for nothing if the tree be older than eighteen years The tree was formerly propagated by a species of pigeon that ate the fruit and voided the seed, but since Falck, one of the Dutch governors, about the middle of the eighteenth century, raised it from berries sown in his garden, it has been regularly cultivated

The barking commences early in May, and continues until late in October Branches of three years old are selected, and topped off with a pruning knife or bill hook To remove the bark a longitudinal incision is made through it on both sides of the shoot, so that it can be gradually loosened and taken off entire, forming hollow cylinders The bark in this state, tied up in bundles, is allowed to remain for twenty-four hours, by which a fermentation is produced that facilitates the separation of the epidermis, which, with the green pulpy matter under it, is carefully scraped off The bark now soon dries, contracts, and assumes the quilled form, after which the smaller pieces are put within the larger The cinnamon, when dry, is tied up in bundles of 70lbs weight, and carried to the Government store-house, where the quality is determined by inspection of the bundles It was formerly chewed for this purpose, and the surgeons who used to be thus employed, had their

and Miscellaneous Particulars

mouths so excoriated, as to be unable to continue the process longer than two days together: but tasting is now seldom had recourse to

Cinnamon bark is astringent, cordial, and tonic. But the principal use of cinnamon is to cover the nauseous state of other remedies (*Thomson's London Dispensatory*, 554)

An oil is procured from the leaves and roots of cinnamon, the former is called the oil of cloves, and the latter the oil of camphor: both are powerfully stimulant, and used in cramps of the stomach, flatulent colic, hiccough, toothach, and nervous langour

According to Sweet L. Cinnamomum is the hardest plant of the genus to cultivate in our stoves. "I have scarcely," he says, "ever seen it do well any where but at Messrs Loddiges," who generally keep their stoves warmer than other gardeners usually do, and the cinnamon likes a warm atmosphere, and very little water in winter It grows best in a mixture of sandy loam and peat, the pots being well drained with small potsherds. Ripened cuttings soon take root in a pot of sand, plunged under a hand-glass, in a good moist heat. (*Bot. Cult.* 74.)

The plant has regularly flowered and ripened seeds in the hothouse of the Bishop of Winchester for several years past.

L. Cassia is also decorticated like the cinnamon, but it is considered of inferior value, on account of containing a greater proportion of mucilage What are called Cassia buds, are not obtained from this tree, but are the hexangular fleshy receptacles of the seed of the L. Cinnamomum. Cassia bark and buds are used in the same manner as cinnamon bark: the tree also affords an oil of similar use In our stoves, the cassia grows more readily than the cinnamon, the same kind of soil suits it; and cuttings root freely treated in the same manner. (*Bot. Cult* 74.)

L. Camphora, an alteration of the Arabic name, *kâfour*, is nearly allied to the cinnamon tree. The roots, wood, and leaves of this tree have a very strong odor of camphor, and from the roots and smaller branches it is obtained by distillation They are cut into chips, which are suspended in a net within a kind of still or iron pot, the bottom of which is covered with water, and an earthen head fitted to it, heat is then applied, and the steam of the boiling water, penetrating the contents of the net, elevates the camphor into the capital, where it concretes on straws, with which that part of the apparatus is lined Camphor is stimulant, narcotic, and diaphoretic, but its stimulant powers are very transitory, and followed by sedative effects. In moderate doses it operates as a cordial, increasing the heat of the body, and exhilarating, besides softening, and removing fuller the pulse, and promoting diaphoresis, in large doses it allays irritation and spasm, abates pain, and induces sleep But in immoderate doses camphor produces vomiting, vertigo, delirium, convulsions, and other

History, Use, Propagation, Culture,

deleterious effects The greater part of the camphor brought to Europe is obtained in Sumatra from the Dryobalanops Camphora. This tree is cut and split, and the camphor which is found concreted in the heart of it is picked out and washed in a ley of soap Zea describes a variety of camphor which is procured in South America from a tree, the botanical characters of which are not yet known, but which is termed *caratta* by the natives The camphor exudes from the bark in the form of tears. (*Thomson's London Dispensatory*, 356)

L. Chloroxylon has its specific from the color of the wood, χλωρον, green, and ξυλον, wood, it is esteemed one of the best timber trees in Jamaica, and used on all occasions where strength and durability are required: being both hard and tough, it answers better than any other wood for the cogs of sugar mills

L. nobilis, the *Laurier*, Fr, *Lorbeerbaum*, Ger, *Alloro*, Ital, *Laurel*, Span, the *Laurus* of the Romans, and *Daphne* of the Greeks, was designated *nobilis* by Linnæus, because it was consecrated to priests, sacrifices, and heroes in the ages of antiquity, and has been celebrated accordingly To the poet and sculptor it still affords emblems for victorious heroes, and it is also used in cookery and medicine In the south of Italy it grows to a sufficient height to be considered a tree, but is so prolific in suckers and low shoots as always to have the character of a shrub. It forms a dense and yet broken and picturesque mass of a very fine deep green, inclining to olive, and is abundantly covered with berries, which are dark purple or black, when ripe. Oil is obtained from the latter by boiling water Both the leaves and the berries have a sweet fragrant odour, and an aromatic, astringent taste, and the oil, which is of a yellowish green color, has a stronger but similar odor and taste Water distilled from the leaves shews traces of prussic acid, and it is probably on this component that their medicinal and poisonous property depend Leaves, berries, and oil are narcotic and carminative. (*Thomson's London Dispensatory*, 360)

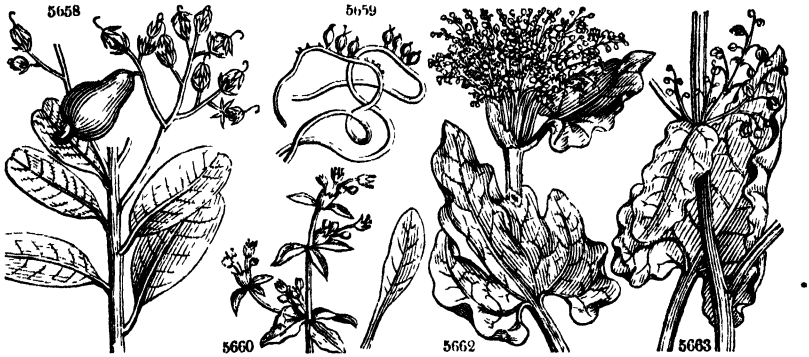
L. indica grows in the Canary Isles and Virginia. The wood is of a yellow color, not heavy, good for building, but better still for furniture it is called *Vignatico* in the island of Madeira, and is probably what is imported into England under the name of Madeira mahogany It is hardly to be distinguished from mahogany, except that it is somewhat less brown (*Hawkesw Voy* II p 5)

L. Persea (Persea is a name under which Theophrastus describes an Egyptian tree not now known,) has a trunk as large as our common apple tree, the bark is smooth, and of an ash color, the branches are very succulent and soft, beset with pretty large oblong smooth leaves, like those of laurel, of a deep green color The flowers are, for the most part, produced towards the extremities of the branches. The fruit is the size of one of our biggest pears The pulp of the fruit is covered with a tough skinny coat, and contains a large rugged seed, which is wrapped up in one or two thin membranous covers This fruit is held in great esteem in the West Indies the pulp is of a pretty firm consistence, and has a delicate rich flavor, it gains upon the palate of most persons, and becomes soon agreeable even to those who cannot like it at first, but it is so rich and mild, that most people make use of some spice or pungent substance to give it a poignancy, and, for this purpose, some make use of wine, some of sugar, some of lime-juice, but most of pepper and salt This fruit seems equally agreeable to the horse, the cow, the dog, and the cat, as well as to all sorts of birds, when plentiful, it makes a great part of the delicacies of the negroes. (*Browne*)

L. Borbonea was regarded by Plumier as a genus distinct from Laurus, and he applied what is now its specific name, in memory of Gaston Bourbon, son of Henry IV and uncle of Louis XIV It is a very common tree in swamps in Carolina, and affords a fine grained wood excellent for cabinets, some of the best resembles watered satin.

L. Sassafras (Sassafras is an alteration of the Spanish word *Saxifras*, which signifies *Saxifrage*, the virtues of which are attributed by the Spanish Americans to this plant,) has the flowers often imperfect as to the male and female organs, which, before observation was so accurate and scientific as at present, led to the conclusion

5648 Leaves veiny lanceolate perennial flat, Branches scarred, Flowers racemose
5649 Leaves veiny elliptical acute perennial, Axils of veins villous beneath, Racemes panicled
5650 Leaves veiny oblong acute at each end perennial shining, Peduncle axill 3-4-flowered
§5651 Leaves ovate coriaceous transversely veiny perennial, Flowers corymbose
5652 Leaves lanceolate perennial, Calyx of fruit berried
5653 Leaves oval lanc perenn glaucous beneath, Berries globose
5654 Branches divaricating flexuose, Leaves oval obtuse smooth at the base beneath bearded, Anth 4-celled
5655 Twiggy naked-flowering, Leaves decid oblong beneath veiny downy, Flowers clustered, Buds villous
5656 Leaves nerveless ovate acute at each end entire annual
5657 Leaves entire and 3-lobed



5658 The only species

5659 Branches filiform lax

5660 Leaves sessile cauline 3 4 cuneate obovate smooth above
5661 Leaves radical stalked lanc oblong villous above

TRIGYNIA.

5662 Leaves obtuse smooth, Veins beneath hairy, Leafst furrowed above rounded at edge
5663 Leaves villous wavy, Leatst flat above with an acute edge

and Miscellaneous Particulars

that one plant bore only males and the other only hermaphrodites, it is now found the alleged males are only imperfect hermaphrodites. The wood, root, and bark have a fragrant odor, and a sweetish aromatic taste. their sensible qualities and virtues depend on an essential oil, which can be obtained separate by distilling the chips or the bark with water it is a stimulating diaphoretic and diuretic, and has been employed in cases of scurvy, chronic rheumatism, gout, and in cutaneous affections, but its effects are very uncertain, and even the diaphoresis which it is supposed to occasion may rather be ascribed to the guaiac, and other more powerful medicines, with which it is generally combined (*Thomson's London Dispensatory*, 361)

The species are well divided into several genera, such as Laurus, Tetranthera, Cinnamomum, and others but as this division has not been applied to the old species of Laurus generally, it has not been practicable to adopt it here

935 *Anacardium* From ανα, in composition, like, and καρδια, heart, in allusion to the form of the nut This is an elegant tree, bearing panicled corymbs of sweet smelling flowers, succeeded by an edible fruit of the pome kind, of a yellow or red color This fruit or apple has an agreeable sub-acid flavor, with some degree of astringency The juice expressed and fermented yields a pleasant wine, and distilled, a spirit is drawn from it, far exceeding arrack or rum, making an admirable punch, and powerfully promoting urine The dried and broken kernels are occasionally imported for mixing with old Madeira wine, the flavor of which they improve prodigiously Some planters in the West Indies roast the ripe fruit, or slice one or two into a bowl of punch, to give it a pleasant flavor The astringency of the juice has recommended it as a very signal remedy in dropsical habits.

The nut protrudes from one end of the apple (*Long*) It is of the size and shape of a hare's kidney, but is much larger at the end next the fruit than at the other The outer shell is of an ash color, and very smooth, under this is another which covers the kernel, between these there is a thick inflammable oil, which is very caustic, this will raise blisters on the skin, and has often been very troublesome to those who have incautiously put the nuts into their mouths to break the shell This oil has been used with great success in eating off ring-worms, cancerous ulcers, and corns, but it ought to be applied with caution The kernel when fresh, has a most delicious taste, and abounds with a sweet milky juice It is an ingredient in puddings, &c When older it is generally roasted, and in this state is not so proper for costive habits Ground with cacao it makes an excellent chocolate When kept too long it becomes shrivelled, and loses its flavor and best qualities. The thick oil of the shell tinges linen of a rusty iron-color, which can hardly be got out, and if any wood be smeared with the oil, it prevents the wood from decaying

From the body of the tree is procured, by tapping or incision, a milky juice, which will stain linen of a deep black, that cannot be washed out again

This tree also annually transudes from five to ten or twelve pounds weight of a fine semi-transparent gum, similar to gum arabic, and not inferior to it in virtue or quality, except that it has a slight astringency, which, perhaps, renders it in some respects more valuable. (*Long's Jam* iii. 725, &c)

As a stove-plant it grows in light loam or rich mould, and ripe cuttings with their leaves, planted in a pot of sand, and plunged under a hand-glass, will strike root

936. *Cassytha* The Greek name of the Cuscuta, which this plant much resembles in habit and characters of analogy Its affinity, however, is very curious, from a minute analysis of its constituent parts it has been decided by the most learned botanists to be referable to Laurineæ

937 *Eriogonum* From εριον, wool, and γονυ, a knee The stem of this plant is very woolly at the joints. The species thrive best in pots, and are principally to be increased by seeds

938 *Rheum.* This name was ingeniously supposed by Linnæus to have been derived from ῥεω, to flow, because the root causes a discharge of bile It, nevertheless, was formed from *Rha*, the ancient name of the Volga.

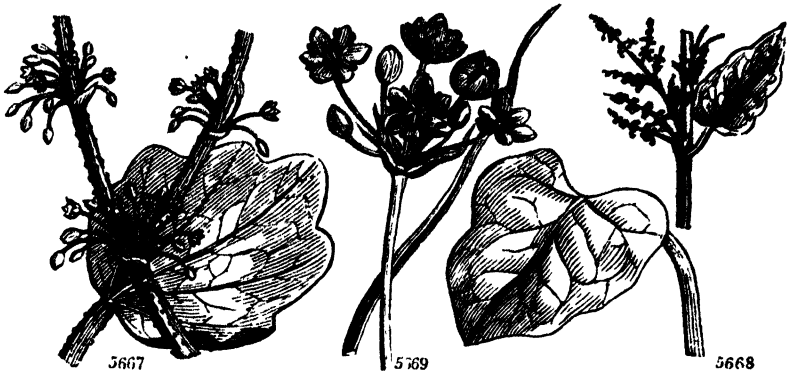
History, Use, Propagation, Culture,

Ammianus Marcellinus, lib. xii., says, "the *Rha* is a river, on the border of which grows a root, which bears its name, and is much renowned in medicine." The construction of the specific names confirms this, *Rha* ponticum, *Rha* barbarum, whence the name *Rhubarb* was obtained



R. Rhaponticum was thought to be the true rhubarb of druggists, till Dr Hope of Edinburgh described the R. palmatum, some seeds of which he had received from Russia, as of the genuine species. It is not, however, finally settled, whether these species or the R. compactum yield the foreign roots, nor does it appear of much consequence, as these three species agree so nearly in their medical properties, that any of them may be used with equal certainty of success. All the rhubarb of commerce, known under the names Turkey or Russian, and East Indian or Chinese, grows on the declivities of the chain of mountains in Tartary which stretches from the Chinese town Sini to the lake Kokonor near Thibet. The soil is light and sandy, and the Bucharians assert that the best grows in the shade on the southern side of the mountains Rhubarb, however, is also cultivated in China, in the province of Chen See, where it is called *Has-houng* In Tartary, the roots are taken up twice a-year, in spring and in autumn, and after being cleansed and decorticated, and the smaller branches cut off, the body of the root is divided transversely into pieces of a moderate size, which are placed on tables, and turned three or four times a-day, during five or six days A hole is then bored through each piece, by which it is hung up to dry, exposed to the air and wind, but sheltered from the sun In about two months, the roots have lost seven parts in eight of their weight, and are fit for the market In China, the roots are not dug up till winter, and the cultivators, after cleaning, scraping off the bark, and cutting them, dry the slices by frequently turning them on stone slabs heated by a fire underneath, after which, the drying is completed by hanging them up in the air exposed to the greatest heat of the sun (*Thomson's London Dispensatory*, 471)

Rhubarb has been cultivated in different parts of Britain with a view to drying the root for medical purposes with the most perfect success, but such is the prejudice in favor of the foreign article, that sufficient de-

5664 Leaves palm acute roughish, Leafst. above obscurely furrowed rounded at edge
5665 Leaves somewhat lobed very obtuse shining finely toothletted smooth
5666 Leaves cordate ovate entire flat smooth, Leafst. half-round angular, Panicle furrowed
5667 Leaves very obtuse somewhat warted, Veins beneath spinulose, Leafst. flat above rounded at edge
5668 Leaves smooth above somewhat lobed acute, Recess of base contracted

HEXAGYNIA.

5669 Flowers in handsome terminal umbels

and Miscellaneous Particulars.

mand was not produced to encourage the cultivator The only point in which British culture was rather deficient was in the drying, but that a little experience would soon have overcome.

R. Rhaponticum and hybridum, indeed any of the species, are or may be cultivated for the petioles of the leaves in a green state, to be used in tarts and pies, as a substitute or along with gooseberries. All that is required is a dry soil well enriched and trenched two, or better, three feet deep The plants the year after planting may have half their leaves slipped off for the cook, as soon as they arrive at full growth Keeping the plants from flowering will obviously strengthen the leaves

Tart rhubarb may be forced either by taking up the roots and planting them in pots, or by covering them with dung where they grow in the open garden, as is done with sea-kale It may also be blanched, as is done with that vegetable (See *Encyc of Gard.* art *Rheum*)

R. Ribes is so called from a rob made from its stalks, and called *Rybès of Serapias*

It is thought that all the supposed species are reducible to Rhaponticum, undulatum, palmatum, and ribes. It is certainly very difficult to distinguish the others

939 *Butomus* From *βους*, an ox, and *τεμνω*, to cut; the sharp leaves of the plant cut and cause to bleed the mouths of cattle feeding upon it.

This is the only plant of the class Enneandria that grows wild in Britain. It is an elegant aquatic. "The water-Gladiole, or grassie-Rush," says Gerarde, "is of all others the fairest and most pleasant to behold, and serveth very well for the decking and trimming up of houses, because of the beautie and braverie thereof."

The corolla varies in different shades of red, or purple mixed with white, and is sometimes entirely white. The stem at bottom and the peduncles at top are often tinged with red. The number three is evidently predominant in the fructification, the corolla being doubly tripetalous, the stamens thrice three, the pistils six, the capsules six, in a hexagon form, the involucre three-leaved.

Class X. — DECANDRIA. 10 Stamens.

This is the last of the Linnean classes in which the stamens are distinct, and bear any determined relation to the other parts of the flower It is composed of portions of a considerable number of natural orders, of which the most important is Leguminosæ, with which the class usually is made to commence These are of two kinds those which are papilionaceous, and those which have a regular expanded flower. The former are remarkable in their kind for bearing distinct stamens combined with a papilionaceous corolla, the greater part are natives of New Holland or the Cape of Good Hope, a very few of the Northern Hemisphere, and al. of them ornamental plants Of those with regular flowers the most beautiful genus is the Bauhinia, which, in the latitudes of the tropics, constitutes the most formidable obstacle to the passage of human beings through the woods, which are interlaced in every direction by the climbing or leaning stems of these and other plants commonly called *Lianes*, the most extensive genus is Cassia, the species of which are little esteemed as objects of ornament, but of material importance in medicine, the famous Senna of the shops being the produce of at least three species The Hæmatoxylon and Swietenia, the one producing Logwood, the other Mahogany, are included in this class, as are the important Quassia drug, and the beautiful tribes of Kalmias, Rhododendrons, and Andromedas

The second and succeeding orders are chiefly occupied by the most important of the genera of the natural order of Caryophylleæ, the whole of which have lately been remodelled and arranged, under the direction of Decandolle, by M Seringe, an ingenious Swiss botanist. Of this order the most extensive genus is Silene, and the most beautiful Dianthus, out of which the fine carnations, pinks, and piccotees of the florist have been obtained

Order 1 MONOGYNIA.  10 Stamens 1 Style.

§ 1 *Leguminosæ Flowers papilionaceous.*

940 *Edwardsia* Cal. 5-toothed Pod 4-winged, many-seeded

941. *Sophora* Cal 5-toothed Pod necklace-shaped, not winged, many-seeded.

942 *Ormosia* Cal 5-cleft, 2-lipped. Stigmas 2, approximate, obtuse. one on one side. Pod compressed, woody, 1-3-seeded.

943. *Anagyris.* Cal 5-toothed, 2-lipped Keel of 2 petals, which are larger than the wings, which are longer than the standard Pod compressed, many-seeded

944 *Thermopsis* Cal. oblong 4-5-cleft, 2-lipped, convex behind. Petals of equal length. Standard reflexed at edges Keel obtuse. Stamens persistent Pod compressed, linear, many-seeded

945. *Virgilia.* Cal. 5-cleft Petals of equal length, standard not reflexed at edges. Stigma beardless. Pod compressed, oblong, many-seeded.

946 *Cyclopia* Cal 5-cleft, unequal, pushed inwards at base Standard with longitudinal wrinkles · wings with a transverse plait. Stamens deciduous Stigma bearded on one side Pod compressed, many-seeded

947 *Baptisia* Cal. half 4-5-cleft, 2-lipped Petals of equal length Standard reflexed at edges. Stamens deciduous Pod ventricose, stalked, many-seeded

948 *Podalyria* Cal 5-cleft, unequal, pushed inwards at base Standard larger than the rest Stamens persistent, connate at base Pod ventricose, many-seeded

949. *Chorozema.* Cal. half-5-cleft, 2-lipped. Keel ventricose, shorter than wings Style short, hooked. Stigma oblique, obtuse Pod ventricose, many-seeded

950 *Podolobium* Cal 5-cleft, 2-lipped Keel compressed, the length of the wings, which are equal to the expanded standard. Ovary many-seeded in a single row Style ascending. Stigma simple. Pod stalked, linear, oblong, moderately ventricose, smooth inside

951 *Oxylobium.* Cal deeply 5-cleft, rather 2-lipped Keel compressed, the length of the wings, which are equal to the open standard. Style ascending Stigma simple Pod many-seeded, ventricose, ovate, acute.

952. *Callistachys* Cal. 2-lipped. Standard erect, keel and wings drooping Style incurved. Stigma simple Pod stalked, woody before ripening, many-celled.

953 *Brachysema* Cal 5-cleft, but little unequal, with a ventricose tube Standard shorter than the compressed keel, which is as long as the wings. Ovary with a stalk, surrounded at base by a little sheath. Style filiform, long Pod many-seeded, ventricose

954 *Gompholobium.* Cal 5-parted, nearly equal. Standard unfurled. Stigma simple Pod many-seeded, nearly spherical, very obtuse, smooth

955 *Burtonia* Cal. deeply 5-cleft. Cor deciduous Petals nearly equal Ovary 2-seeded Style subulate, dilated at base Stigma blunt, beardless Pod roundish, moderately inflated No appendage to the seed.

956 *Jacksonia* Cal. 5-parted, nearly equal Corolla and stamens deciduous Ovary 2-seeded. Style subulate, filiform. Stigma simple. Pod moderately inflated, ovate or oblong, with valves downy inside No appendage to the seed

957 *Viminaria* Cal. 5-toothed, angular Style capillary, a little longer than the 2-seeded ovary Stigma simple Pod valveless, ovate No appendage to the seed

958 *Sphærolobium* Cal 5-fid, 2-lipped Style on one side at the end, with a membranous appendage, on the other beardless Stigma terminal Pod spherical

959 *Aotus* Cal. 5-cleft, 2-lipped. Stamens deciduous Ovary 2-seeded. Style filiform. Pod 2-valved No appendage to the seed.

960 *Dillwynia* Cal 5-cleft, 2-lipped, narrow at base Petals and stamens deciduous, inserted into the middle of tube of calyx Standard twice as broad as long, spreading, 2-lobed. Ovary 2-seeded. Style hooked Stigma capitate Pod inflated Seeds with an appendage

961 *Eutaxia* Cal. 2-lipped Standard a little broader than long Ovary 2-seeded. Style hooked. Stigma capitate. Pod moderately ventricose Seed with an appendage Leaves opposite

962. *Sclerothamnus* Cal 5-cleft, 2-lipped, with 2 bractes at base. Keel as long as wings. Ovary 2-seeded, stalked. Style ascending filiform. Stigma simple. Pod ventricose

963. *Gastrolobium* Cal 5-cleft, 2-lipped, without bractes Petals of equal length Ovary 2-seeded, stalked Style subulate, ascending Stigma simple Pod ventricose Seeds with an appendage.

964. *Euchilus.* Cal deeply 5-cleft, 2-lipped, the upper lip very large, with 2 bractes at base Keel as long as wings Ovary 2-seeded, stalked. Style subulate, ascending Stigma simple. Pod compressed. Appendage of the seed with the hind lobes entire

965. *Pultenæa.* Cal. 5-cleft with even-sized lips, 2-bracted Ovary sessile, 2-seeded. Style subulate, ascending. Stigma simple. Appendage of the seed with the hind lobes cut.

966. *Daviesia* Cal. angular without bractes Keel shorter than standard Ovary stalked, 2-seeded Style straight. Stigma simple. Pod compressed, angular, opening with elasticity. Appendage of seed entire behind.

967. *Mirbelia.* Cal. 5-cleft, 2-lipped. Pod 2-celled, with each suture bent inwards.

968. *Cercis.* Cal. 5-toothed. Pod compressed with the seed-bearing suture winged. Seeds obovate, with a straight embryo.
969 *Schotia* Cal. 5-cleft. Petals 5, inserted on the calyx, and approaching the papilionaceous form. Pod stalked.

§ 2. *Leguminosæ Flowers nearly regular.*

970 *Bauhinia.* Cal. 5-cleft, deciduous Petals spreading, oblong, clawed; the upper one more distant; all inserted in the calyx.
971. *Afzelia* Cal tubular, with a 4-cleft deciduous limb. Petals 4, with claws · the upper very large The upper filaments sterile. Pod many-celled Seed with an arillus at base
972. *Hymenæa* Cal 5-parted. Petals 5, nearly equal Pod filled with a powdery fæcula.
973 *Cynometra.* Cal 4-leaved · the opposite leaves largest Pod 1-seeded, fleshy
974. *Cassia* Cal. 5-leaved. Petals 5 The three upper anthers sterile, three lower beaked.
975 *Cathartocarpus.* Cal. 5-parted, deciduous Cor. regular, of 5 petals. The lower filaments bowed. Pod long, round, woody, many-celled. Cells filled with pulp
976. *Parkinsonia* Cal. 5-cleft Petals 5, ovate, the lowest reniform Style O Pod necklace-shaped
977 *Poinciana.* Cal. 5-parted Petals 5, clawed, the upper dissimilar Stamens very long, all fertile Pod plano-compressed
978 *Cæsalpinia* Cal. 5-parted, with the lowest segment largest and vaulted. Petals 5. Stamens woolly at base, all fertile Pod unarmed Seeds compressed.
979 *Guilandina.* Cal. 5-cleft, the lowest segment largest Petals inserted in the neck of the calyx, nearly equal. Pod prickly. Seeds stony
980 *Hyperanthera.* Cal 5-parted. Petals inserted in calyx, unequal Pod 3-valved, torulose. Seeds winged
981 *Hoffmannseggia* Cal 5-parted, persistent Petals 5, clawed, spreading · the upper broader, glandular at base Filaments glandular Stigma clavate Pod linear, compressed, many-seeded
982 *Adenanthera.* Cal 5-toothed. Petals 5 Anthers with a globose gland at their extremity Pod membranous Seeds lentiform
983. *Cadia* Cal 5-cleft Petals 5, equal, obcordate Pod many-seeded.
984 *Prosopis* Cal hemispherical, 4-toothed Pod many-seeded
985 *Hæmatoxylon* Cal 5-parted Petals 5 Caps lanceolate, 1-celled, 2-valved, valves navicular.
986. *Copaifera.* Cal O Petals 4 Pod 1-seeded

§ 3 *Ovary superior Stamens united in a tube Flowers complete*

987. *Trichilia* Cal 4-5-toothed Petals 4-5, ovate or oblong Stamens sometimes nearly distinct. Caps. 3-celled, 3-valved, with one or two seeded cells Seeds with a berried arillus
988 *Melia.* Cal 5-toothed Petals 5 Drupe with a five-celled nut.
989. *Quassia* Cal. urceolate, 4-5-toothed. Petals 4-5, short, silky outside. Stamens with a short tube. Stigma capitate Caps coriaceous, 4-5-celled, opening at the end into 4-5-valves
990 *Swietenia* Cal. 5-cleft Petals 5 Caps 5-celled, woody, opening at base Seeds imbricated, winged.
991. *Ekebergia.* Cal 4-parted. Petals 4 Nect. a ring surrounding the ovary Berry 5-seeded
992. *Heynea* Cal. 5-toothed. Petals 5 Style 1 Ovary 2-celled. Caps 2-valved, 1-celled, 1-seeded. Seed with an arillus not winged.

§ 4 *Ovary superior Stamens separate Flowers complete*

993 *Guaiacum* Cal 5-parted, unequal Petals 5, equal Caps. angular, 2-5-celled
994 *Zygophyllum.* Cal 5-leaved Petals 5. Nect. 10-leaved, covering the ovary and bearing the stamens. Caps 5-celled.
995 *Fagonia* Cal 5-leaved. Petals 5, cordate Caps 5-celled, 10-valved, with 1-seeded cells
996 *Tribulus* Cal 5-parted. Petals 5, spreading Style O Caps 5, gibbous, spiny, many-seeded.
997. *Dictamnus* Cal. 5-leaved, deciduous. Petals 5, clawed, unequal Filam. declinate, with glandular dots Caps 5, united
998 *Ruta* Cal 5-parted Petals concave Recept surrounded by 10 honey-spots Caps. lobed.
999 *Crowea* Cal 5-parted Petals 5, sessile. Stamens flat, subulate, connected by entangled hairs Anthers united lengthwise to the filaments on their inner side Style from the base of the ovary. Caps 5, united. Seeds with an arillus
1000. *Codon* Cal 10-parted Cor campanulate, 10-cleft Caps many-seeded
1001 *Gomphia* Petals 5 Filaments scarcely any Anthers long, pyramidal, erect, opening at end by a double pore
1002 *Quassia* Cal. 5-leaved. Petals 5 Nect 5-leaved. Drupes 5, distant, 2-valved, 1-seeded, inserted on a fleshy receptacle.
1003 *Limonia* Parts of the flower 4 or 5 Stamens free, twice as numerous as petals, or sometimes as many only Fruit berried, pulpy, 4-5-celled, with 1-celled seeds.
1004 *Glycosmis* Parts of the flower 5 Stamens with flat subulate filaments, and elliptical anthers. Style short, cylindrical Ovary 5-celled Fruit fleshy, 1-2-celled, 1-2-seeded. Coat of the seed membranous.
1005. *Murraya* Parts of the flower 5 Cor campanulate Stamens with linear subulate stamens, and roundish anthers Fruit fleshy, berried, 1-2-celled, 1-2-seeded. Coat of the seed thick, woolly
1006 *Cookia* Parts of the flower 5. Petals navicular, villous Stamens with linear distinct filaments, and roundish anthers. Fruit berried, globose, 1-5-celled, with one-seeded cells
1007. *Gærtnera* Cal 5-parted. Petals 5 torn Filaments slightly cohering at base: one longer than the rest. Samara 1-seeded, with four unequal wings.
1008. *Monotropa* Cal like a corolla, gibbous at the base Capsule 5-celled, many-seeded.
1009. *Dionæa* Cal. 5-leaved Petals 5 Capsule 1-celled, gibbous, many-seeded.
1010 *Garuga* Cal campanulate, 5-cleft, bearing the stamens. Petals equal. Stigma 5-lobed. Drupe with 2-5 1-seeded nuts.
1011. *Kalmia* Cal 5-parted. Cor hypocrateriform, with a limb having 5 horns beneath. Caps. 5-celled.
1012 *Ledum* Cal 5-cleft. Cor flat, 5-parted. Caps. 5-celled, bursting at base.
1013 *Rhodora.* Cal. 5-toothed. Petals 3. Stamens declinate Caps 5-celled.
1014 *Rhododendron* Cal 5-parted. Cor somewhat funnel-shaped. Stamens declinate Caps 5-celled.
1015. *Epigæa* Outer calyx 3-leaved, inner 5-parted Cor salver-shaped. Caps. 5-celled.
1016. *Andromeda* Cal 5-parted Cor ovate, with a 5-cleft orifice Caps. 5-celled: valves contrary to the dissepiment.
1017. *Enkianthus* Cal small, persistent. Cor. campanulate, with a 5-cleft limb. Nectaries 5, at base of corolla. Anthers 2-horned. Capsule 1
1018. *Gaultheria* Outer calyx 2-leaved: inner 5-cleft, ovate Nect. with 10 points. Caps. 5-celled, clothed with an inner berried calyx
1019 *Arbutus.* Cal 5-parted. Cor ovate, with a 5-cleft orifice; pellucid at base. Berry 5-celled.
1020. *Clethra* Cal 5-parted. Petals 5 Stigma 3-fid. Caps. 3-celled, 3-valved.
1021. *Mylocaryum.* Cal. 5-toothed. Petals 5. Stigma capitate, 3-cornered, sessile. Caps. 3 or 4-winged, 3-celled.
1022. *Pyrola* Cal 5-parted Petals 5. Capsule 5-celled, opening at the angles.
1023 *Chimaphila.* Cal. 5-parted Petals 5 Stigma sessile, thick, orbicular, sunk in the ovary Anthers beaked, opening by a 2-valved cleft. Caps. 5-celled, opening at the angles.

1024. *Inocarpus.* Cal bifid Cor funnel-shaped. Stamens in a double row. Drupe 1-seeded.
1025. *Styrax.* Cal. inferior Cor. funnel-shaped Drupe 2-seeded

§ 5 *Ovary inferior. Flowers complete.*

1026. *Jussiæa.* Cal. 4-5-parted Petals 4-5. Caps 4-5-celled, oblong, opening at the angles. Seeds numerous, minute.
1027. *Getonia.* Cal 5-leaved, persistent. Filaments alternately broader, 5 in the orifice of the calyx Seed coated, oblong, crowned by the calyx
1028. *Quisqualis* Petals 5, inserted on a filiform calyx
1029. *Melastoma.* Cal 5-cleft, campanulate Petals 5, inserted in calyx Berry 5-celled, surrounded by calyx.
1030 *Petaloma* Petals 5, between the segments of the calyx Berry 1-celled
1031 *Acisanthera.* Cal. ventricose, 5-cleft Petals 5. Anthers sagittate, versatile Caps. crowned, 2-celled, many-seeded.

§ 6 *Flowers incomplete, or apetalous.*

1032 *Datis* Involucre 4-leaved. Cor 4-5-cleft. Berry 1-seeded
1033 *Bucida* Cal 5-toothed, superior Berry 1-seeded
1034 *Samyda* Cal 5-parted, colored. Nect. campanulate, stamen-bearing Caps berried inside, 4-valved, 1-celled. Seeds nidulant

Order 2 DIGYNIA  10 Stamens 2 Styles.

1035 *Royena* Cal. urceolate. Cor 1-petalous, with a revolute limb Caps 1-celled, 4-valved.
1036 *Trianthema* Cal mucronate under the end. Cor O Stam 5-10 Ovary blunt. Caps cut round
1037 *Scleranthus* Cal 1-leaved Cor O Seeds 2, included in calyx
1038 *Cunonia* Petals 5 Sepals 5 Capsule 2-celled, acute
1039 *Hydrangea* Cal superior, 5-toothed Petals 5 Caps 2-celled, 2-beaked, opening by a hole between the beaks
1040 *Chrysosplenium* Cal 4-5-cleft, colored Cor O Caps 2-beaked, 1-celled, many-seeded.
1041 *Saxifraga* Cal 5-parted. Petals 5 Caps. 2-beaked, 1-celled, many-seeded
1042 *Tiarella.* Cal. 5-parted. Petals 5, inserted in the calyx, entire Caps 1-celled, 2-valved · one valve largest
1043 *Mitella.* Cal. 5-cleft Petals 5, inserted in calyx, pinnatifid. Caps. 1-celled 2-valved, with equal valves
1044 *Gypsophila* Cal 1-leaved, campanulate, angular Petals 5, ovate, sessile Caps globose, 1-celled.
1045 *Saponaria* Cal 1-leaved, naked Petals 5, clawed. Caps 1-celled, oblong
1046. *Dianthus* Cal. cylindrical, 1-leaved, with scales at the base. Petals 5, clawed Capsule cylindrical, 1-celled.

History, Use, Propagation, Culture,

940. *Edwardsia* Named after the late Mr Sydenham Edwards, a celebrated botanical draughtsman. The reputation of the Botanical Magazine has arisen almost wholly from the skill he displayed in the management of the figures of that work. These plants are hardy enough to survive through our winters out of doors, when they are not very severe but are best protected under a frame, or planted in a conservatory: they generally ripen seeds, by which, or by young cuttings planted under a bell-glass in sand, they may be readily encreased. (*Bot. Cult.* 183.)

Order 3. TRIGYNIA.  10 Stamens. 3 Styles.

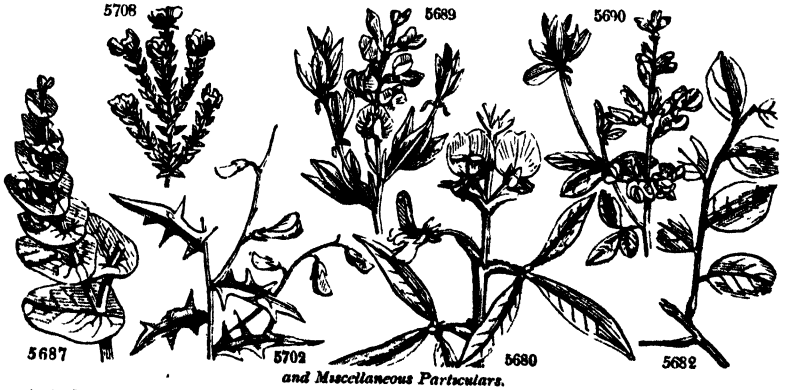
1047. *Cucubalus.* Cal. 1-leaved, inflated. Petals 5, clawed. Berry superior, 1-celled, many-seeded.
1048 *Silene.* Cal. 1-leaved, ventricose. Petals 5, clawed. Caps ½-3-celled, opening at end, many-seeded.
1049. *Stellaria* Cal. 5-leaved, spreading Petals 5, 2-parted. Caps 1-celled, many-seeded.
1050. *Arenaria* Cal. 5-leaved, spreading Petals 5, entire Caps 1-celled, many-seeded.
1051 *Cherleria.* Cal 5-leaved. Nectaries 5, bifid, petal-like Every other anther sterile. Caps 3-valved, 3-celled, 3-seeded
1052 *Brunnichia* Cal ventricose, 5-cleft. Cor O. Caps 3-cornered, 1-celled, 1-seeded.
1053. *Gardella.* Cal. 5-leaved, petaloid. Nect. 5, two-lipped, bifid Caps 3, united, many-seeded
1054. *Malpighia.* Sepals 5, with two honey pores at base. Petals 5, roundish, clawed. Filaments cohering at base. Drupe 1-celled, with 3 one-celled nuts
1055. *Banisteria.* Cal. 5-parted, with two honey pores outside at the base. Petals roundish, clawed. Filaments cohering at base. Samaræ 3, 1-seeded, with a single wing at end
1056. *Hiræa* Cal. without glands Petals 5, with claws Samaræ 3, surrounded by two opposite wings.

Order 4. PENTAGYNIA.  10 Stamens. 5 Styles.

1057 *Cnestis.* Petals 5 Capsules 5, one-seeded
1058. *Averrhoa.* Sepals 5. Petals 5, spreading upwards. Stamens inserted in a nectariferous ring: every other one shorter. Apple 5-cornered, 5-celled
1059 *Spondias* Cal 5-toothed. Petals 5 Drupe with a 5-celled nut
1060 *Cotyledon.* Cal 5-cleft Cor 1-petalous Five honey scales at the base of ovary. Caps 5.
1061 *Sedum.* Cal 5-cleft. Petals 5 Five honey scales at base of ovary. Caps. 5
1062 *Penthorum* Cal. 5-cleft. Petals O to 5 Caps 5-pointed, 5-celled.
1063 *Grielum* Cal. 5-cleft. Petals 5 Filaments persistent Pericarps 5, one-seeded.
1064. *Biophyton* Sepals 5 Petals 5 Stamens all distinct, the five outer shortest. Styles 5, emarginate at end Capsule ovate, round, somewhat 5-cornered.
1065. *Oxalis* Sepals 5, distinct or united at base Petals 5 Stamens united at base, the five outer shortest. Styles 5, pencil-shaped, or capitate at end Capsule oblong or cylindrical.
1066 *Agrostemma.* Cal 1-leaved, coriaceous Pet 5-clawed. Limb obtuse, undivided. Caps 1-celled.
1067 *Lychnis* Cal. 1-leaved, oblong, smooth Petals 5-clawed, with a nearly 2-fid limb Caps 5-celled.
1068 *Cerastium.* Sepals 5 Petals bifid Capsule 1-celled, opening at end
1069 *Larbræa* Cal 5-cleft, urceolate at base Petals 5, biparted, perigynous. Styles 5 Ovary 1-celled, many-seeded. Capsule 6-valved at end.
1070 *Spergula.* Sepals 5. Petals 5, entire Capsule ovate, 1-celled, 5-valved

Order 5 DECAGYNIA.  10 Stamens 10 Styles

1071. *Phytolacca.* Sepals 5 Berry superior, 10-celled, 10-seeded



---

MONOGYNIA.

5670 Leaflets 13-19 lanceolate oblong
5671 Leaflets 8-10 lines long obovate, Pubescence yellowish brown
5672 Leaflets 25-41 obovate

5673 A tree, Leaflets roundish or oval very obtuse at each end as well as the calyx downy
5674 A tree, Leaflets oblong ovate acute and pods smooth
5675 Herbaceous, Leaflets oblong when full-grown silky above
5676 Herbaceous, Leaflets ovate-oblong smoothish

5677 Leaflets 9-11 acuminate smooth on each side, Pods downy

and Miscellaneous Particulars.

941 *Sophora.* An alteration of the Arabic name *Sophera.* This genus has been much altered from what it formerly was. It now consists chiefly of fine trees, some of which are hardy.
942. *Ormosia.* From ορμος, a necklace, for making which the handsome seeds, red with a black-eye, of the species are well adapted. The kind cultivated in England is exceedingly rare.

History, Use, Propagation, Culture,

943 *Anagyris.* From ἀνα, like, and γυρος, a circle Its pod is curved inwards at its extremity Small trees native of the South of Europe and North of Africa, and one doubtful species of Nepal. Young cuttings root in sand under a hand-glass

944 *Thermopsis.* So named from the resemblance of the flower to that of a Lupine This genus is cultivated with difficulty: it grows best in a light loamy soil, and may be increased by seed, dividing the root is liable to injure the plant, so that it is increased with difficulty by that means. (*Bot. Cult.* 427)

945. *Virgilia.* A genus dedicated by Lamarck to the poet Virgil, whose Georgics contain many things interesting to botanists.

946. *Cyclopia* Named by Ventenat, from κυκλος, a circle, and πους, a foot, in allusion to the replicate circle which is found about the base of the pods

947. *Baptisia.* So named from βαπτω, to dye, in allusion to the economical properties of some species. Herbaceous plants of easy cultivation, and as border flowers ornamental.

948. *Podalyria.* Podalyrius was a son of Æsculapius Small Cape shrubs, with simple silky leaves and purple blossoms The species may be grown in leaf mould and peat, or peat loam, and rooted by cuttings in sand, or raised from seeds.

949. *Chorozemia* M. Labillardiére originally discovered this plant upon the south-west coast of New

5678 Leaves lanceolate acute
5679 Leaves elliptical obtuse
5680 Leaves lanceolate shining silky beneath

5681 Leaflets oblong-lanceolate, Stipules lanceolate twice as long as stalk, Pedicels whorled

5682 Leaves pinnate, Leaflets with a short point smooth, Racemes long pendulous
5683 Stamens persistent, Ovaries downy, Leaflets oval obtuse pointless
5684 Stamens persistent, Ovaries smooth, Base of calyx pushed inwards, Leaflets oval obt. with a little point
5685 Stam decid woolly at base, Ovaries downy, Keel acuminate, Leaflets lanceolate

5686 Leaflets subulate and sepals pointless, Bractes oblong ovate shorter than peduncle, Branchlets smooth

5687 Leaves perfoliate entire roundish
5688 Stem and leaves very hairy, Leaflets oval obtuse, Raceme terminal spiked
5689 Leaves ternate stalked, Leaflets cuneate lanceolate, Stipules longer than stalk lanceolate
5690 Leaves ternate stalked, Leafl ellipt. obl. Stipules deciduous subulate shorter than stalk, Ovaries smooth
5691 Leaves ternate stalked, Leafl. roundish obovate, Stipules setaceous obsolete

5692 Leaves oblong obovate on both sides with the calyxes silky, Pedunc one-fl. as long as leaves
5693 Leaves oblong obovate on both sides with the calyxes silky, several times longer than the 1-flow. fl-stalk
5694 Leaves cuneiform emarginate silky, Pedunc shorter than leaf
5695 Leaves oval silky on both sides shorter than 2-fl peduncle, Cal downy rough
5696 Lvs oval and obov pubes beneath netted · when full-grown not silky, Cal. vill. with a scarious refl. limb
5697 Leaves ovate reticulate, Branches hairy angular striated, Peduncles as long as leaves
5698 Leaves simple ovate downy, Fl axillary, Peduncles longer than leaf
5699 Leaves elliptical-lanceolate, Peduncles 1-fl shorter than leaves, Calyx deeply split
5700 Leaves villous stalked upper ovate, lower roundish, Cal villous with segments as long as wings
5701 Leaves cordate roundish subsessile very villous, Segments of villous calyx shorter than wings

5702 Leaves pinnatifid-toothed spiny oblong-lanceolate · with an entire point longer than the teeth
5703 Leaves sinuate-toothed spiny oblong obtuse, Bractes below the end of stalk
5704 Leaves entire flat mucronate. lower rhomboid orbicular, the upper elliptical lanceolate

5705 Lvs opp spiny toothed 3-lobed with a transverse base, Lateral lobes much shorter than term toothed one

5706 Leaves lin lanc. Bractes adhering to top of the footstalk, Corymb clust Pods scarcely longer than cal.
5707 Leaves oval obl. Bractes deciduous below the end of footstalk, Corymb. clust. Pods twice as long as cal
5708 Leaves ovate cordate hairy, Umb. terminal sessile

5709 Leaves lanceolate acute
5710 Leaves ternate obovate mucronate silky beneath.

5711 Leaves ovate flat, Standard oblong obovate
5712 Leaves elliptical wavy mucronate, Standard oblong cordate

and Miscellaneous Particulars

Holland, at the foot of the mountains, in a loamy soil, near a spot where, after having been tantalised with finding many salt springs, his party had just met with an ample supply of fresh water. This welcome refreshment, of which he speaks feelingly in his book, seems to have suggested a name for this plant, which he had properly determined to constitute a new genus. He called it *Chorozêma*, evidently from χορος, a dance or joyous assembly, and ζημα, a drink, in allusion to the circumstance just mentioned. (*Smith*)

This genus ripens abundance of seeds, from which it may be readily increased, and also by young cuttings in sand under a bell-glass.

950 *Podolobium*. This and the succeeding names ending in *lobium*, refer in that part of their derivation to their pod; this genus is called from πους ποδος, a foot, the pod being on a stalk The species may be treated as Chorozemia.

951. *Oxylobium*. From οξυς, pointed, the pods being pointed. See Podolobium.

952. *Callistachys*. From καλος, beautiful, and σταχυς, a spike, in reference to the fine spikes of yellow flowers. These are handsome conservatory shrubs, which grow rapidly and flower freely. They may be raised from seeds or cuttings in sand under a bell-glass.

953. *Brachysema*. From βραχυς, short, and σημα, a standard. The standard of the flower of the genus is very short This is a handsome climber, increased by layers, cuttings in sand, or by seeds.

History, Use, Propagation, Culture

954 *Gompholobium* The name of this genus alludes to the tumid shape of the legume, which swells from a narrow base upwards, according to the primary signification of γομφος, a word thence used to signify a club or wedge, or any thing formed upon a similar principle Delicate plants, difficult to preserve, requiring a large proportion of sand in the peat, and moderate watering Young cuttings root under a bell-glass in sand.

955 *Burtonia.* A genus defined in the Hortus Kewensis, without an explanation of the origin of the name This plant, Sweet observes, requires more than ordinary treatment to keep it in good health, an equal mixture of very sandy loam and peat is the best soil for it, and the pots to be well drained with small potsherds, that the water may pass off freely, as nothing is more injurious to it than too much water Young cuttings are not difficult to root, planted in sand under a bell-glass, it may also be raised from seeds, which are sometimes produced (*Bot Cult* 156)

956 *Jacksonia* Named after Mr Jackson, formerly librarian to Aylmer Bourke Lambert, and an excellent practical botanist, of whom too little is known Young cuttings will root in sand under a bell-glass, or ripened ones under a hand-glass.

957 *Viminaria* From *vimen*, a twig The appearance of the species which have no leaves is that of a bundle of naked twigs.

5713 Leaves term Leafl. lin or obl lin an inch and more long, Stem erect, Keel fringed, Cal in fruit reflexed

5714 Leaves ternate linear mucronate straight, Branches angular smooth
5715 Leaves ternate, Leafl obovate edged flat, Stipules as long as leafstalk, Cor. length of calyx
5716 Lvs tern and quinate, Leafl linear recurved at edge, somewhat dilated at end, Stem procum. or twining
5717 Leaves ternate linear smooth mucronate, Branches round hairy, Keel hairy
5718 Leaves pinn. Leafl subulate linear mucronate rough above, Cal hairy shorter than pod, Keel silky ciliate
5719 Leaves pinn of many pairs, Leafl. subulate veiny revolute at edge and calyxes smooth, Cor. purple

5720 Leaves ternate, Cal smooth, Style beyond the middle beardless

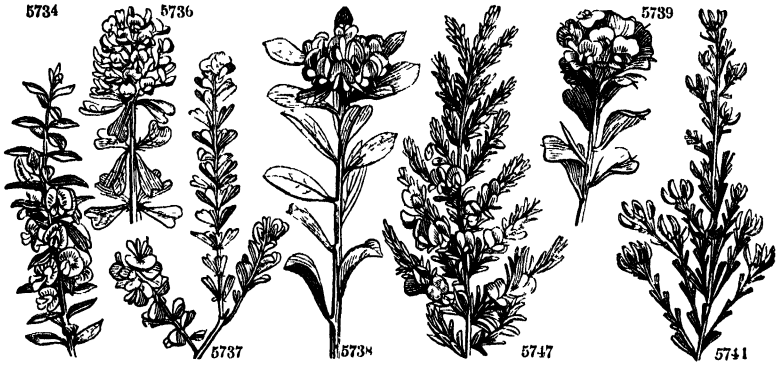
5721 Arborescent unarmed, Branches angular, Racemes terminal
5722 Shrubby, Branches spiny 2-3-chotomous spreading angular, Bractes very short

5723 Segments of calyx straight ovate
5724 Flowers racemose, Segments of calyx lanceolate reflexed

5725 Tube of cal a little shorter than lips, Style included bowed from the base, Cor yellow
5726 Tube of cal twice as short as the lips, Cor red

5727 Cal silky with appressed hairs, Pods stalked, Seeds dotted rugose, Leaves rough above

5728 Flowers axillary ternate, Leaves subulate mucronate
5729 Corymbs terminal sessile, Leaves subul rough with dots divaricate twisted, Branches pubescent
5730 Corymbs terminal stalked, Leaves filiform erect smooth, Mucro weak recurved
5731 Leaves short spreading decussate, Fl capitate, Pedunc with two bractes, Stigma capitate
5732 Corymbs terminal sessile, Leaves filiform erect, with a weak short point, Branches silky
5733 Leaves acerose horizontal, Branches weak, Heads 3-9-flowered

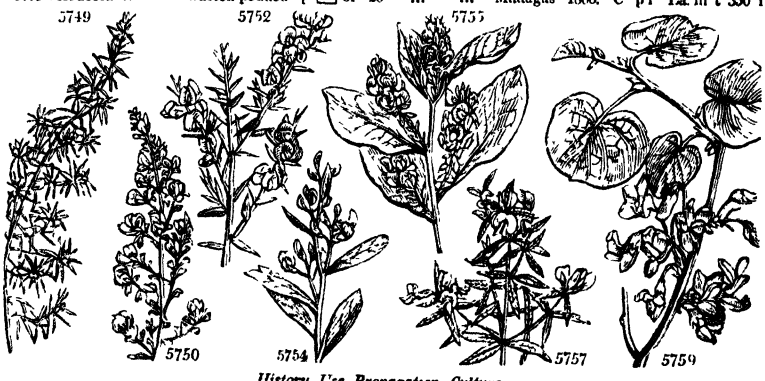


5734 Leaves lanceolate or lanceolate-obovate, Peduncles axillary twin, Appendages of wings very short

5735 The only species

5736 Lvs beneath somew silky retuse, Lobes round longer than little point, Stalk of pod as long as tube of cal

5737 The only species



5738 Heads terminal, Leaves obovate oblong flat quite smooth 3 times as long as broad, Point pungent
5739 Heads term. Leaves cuneate obcord retuse flat smooth scarcely twice as long as broad, Point pungent
5740 Heads term few-fl Leaves cuneate truncate bristly pointed recurved at edge rough above villous beneath
5741 Heads term Leaves linear retuse blunt flat smooth, Bractes a little longer than cal
5742 Heads term Leaves obovate mucronate smooth, Stem upright, Calyx and pods hairy
5743 Bractes shorter than 6-8-fl head, Lvs lin with a little point and recurv edge, Stip shorter than footstalk
5744 Leaves linear mucronate revolute recurved at end, Stipules solitary 2-nerved with membr torn sheaths
5745 Heads many-fl Bractes about as long as cal Leaves flat linear acute, Stipules bind flat imbricated
5746 Fl axill Leaves linear lanceolate mucronate smooth, Stip imbric ciliated, Cal and bractes bearded
5747 Racemes leafy, Leaves linear oblong, above concave, beneath cal and branchlets pilose

and Miscellaneous Particulars

958 *Sphærolobium* From σφαιρα, a sphere, the pods being nearly spherical. See Jacksonia
959 *Aotus* From α, privative, and ωτα, ears, in allusion to the want of the appendages to the calyx in this genus In Pultenæa, to which it is most nearly allied, they are very distinct
960. *Dillwynia* Named by Sir James Edward Smith, after Mr Lewis Weston Dillwyn, whose labors upon Confervæ and other parts of British botany are well known These plants being liable to suffer from wet, the pots must be well drained with sherds and refuse peat siftings Young cuttings root freely in sand under a bell-glass.
961 *Eutaxia* From ευταξια, modesty, in allusion to the humble, modest appearance of the plant Mr Sweet directs to top the plants frequently when young, otherwise they are apt to run up naked and unsightly.
962 *Sclerothamnus* From σκληρος, hard, and θαμνος, a shrub The species are rigid plants with stiff hard leaves
963 *Gastrolobium* From γαστηρ, the belly; or, in botanical composition, something inflated. The pods of the genus are much swollen
964 *Euchilus* From ευ, well, and χειλος, a lip, well lipped The upper lip of the calyx is very large
965. *Pultenæa* Named after William Pulteney, M D, author of a view of the writings of Linnæus, and

History, Use, Propagation, Culture,

of various other works of merit. These are small New Holland bushes, with numerous yellow flowers, frequently brown on the outside

966 *Daviesia* Named after the Rev Hugh Davies, a Welsh botanist Plants like furze The species root best when the cuttings are somewhat ripened and planted in pots of sand, and covered with a hand-glass without bottom heat

967 *Mirbelia* In honor of Mr Mirbel, a distinguished French physiological botanist, whose elucidations of the reticulated structure of vegetables make it proper to consecrate to his merits plants remarkable for their reticulation

968 *Cercis* Κιρκις is a name of Theophrastus, supposed to have appertained to the tree now so called *Gaunter* or *Arbre de Judée*, Fr, *Arbold Amor*, Span Handsome low trees, with singular leaves and fine shewy flowers These having an agreeable poignancy, and being abundant on the branches, are frequently eaten in salads on the continent, and those of the C canadensis are pickled by the French families in Canada The wood of both species is finely veined with black and green, and takes a good polish, and the young branches of the Canadian species are said to dye wool of a fine nankeen color They may be propagated either by layers or seeds the latter make the best plants. Gerarde, in compliance with the popular notions of his time, says, "this is the tree whereon Judas did hang himselfe, and not upon the elder tree, as it is said"

969 *Schotia* So named by Jacquin, in memory of Richard van der Schott, a Dutchman, gardener at Schoenbrunn, and his companion in his travels This beautiful genus has lately been increased by Burchell, the African traveller "They require," Sweet observes, "rather more warmth than a common greenhouse, to keep them in good health through the winter The coldest part of the stove will suit them better, but they should not be plunged in the tan, as they want no bottom heat A mixture of loam and peat is the best soil for them, and cuttings planted in sand, and plunged in mould (not in tan), under a hand-glass, will strike root" (*Bot Cult* 105)

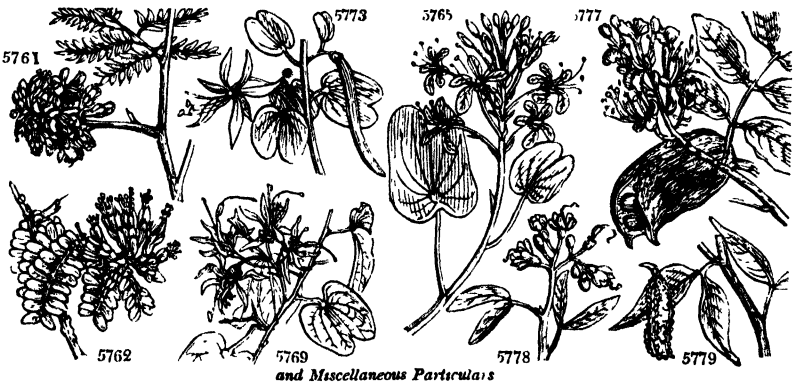
970 *Bauhinia* So named by Plumier, in honor of the two famous botanists, John and Caspar Bauhin. The species consist of trees or shrubs, most of them climbing The leaves are simple, but two-lobed or two-

5748 Very smooth, Fl axill Leaves oblong linear mucronate flat
5749 Heads terminal 2-flowered, Fruit lateral, Leaves subulate linear hairy above concave
5750 Heads terminal few-fl. Leaves wedge-shaped at the end dilated 2-lobed above rough beneath silky

5751 Leaves linear revolute pungent straight rough, Flowers axillary solitary
5752 Branches spiny smooth spreading, Leaves lanceolate or linear, Pedunc axill 1-fl Bractes 8 imbricated
5753 Leaves linear oblong flat pointless, Pedunc axill twin corymbose many-fl Calyx regular
5754 Branches unarmed, Lvs long-lanc. with a very short weak point, Corymbs axill Upper lip of calyx retuse

5755 Branches unarmed, Leaves ellipt. or oval veiny attenuated at base, Racemes axillary many-fl.
5756 Stem leafless winged, Umbels lateral, Calyx and bractes fringed

5757 Leaves lanceolate linear veiny, Ovaries 2-seeded
5758 Leaves wedge-shaped at the end dilated-trifid



5759 Leaves orbicular cordate
5760 Leaves cordate acuminate

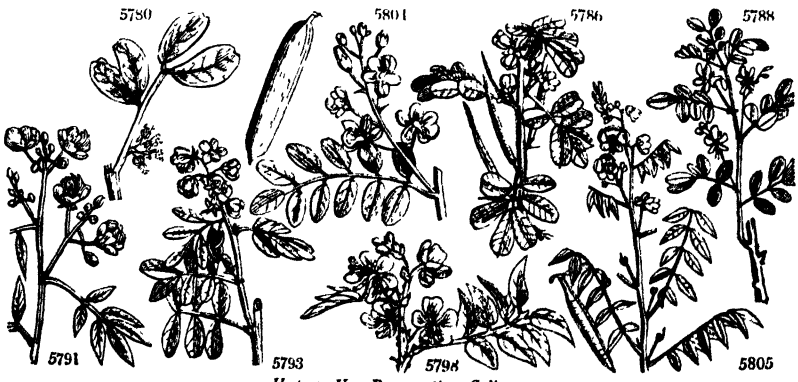
5761 Leaves 7-10 pairs oval-lanceolate mucronate, Stipules subulate
5762 Leaves 8-10 pairs oval obtuse mucronate or not, at the base in front a little swollen
5763 Leaves 5 pairs oval acute mucronate, Stipules half-ovate falcate mucronate

5764 Stem tendril-bearing, Lobes of leaves attenuated
5765 Stem tendril-bearing, Fl triandr on outside with stam at base hairy, Lvs downy beneath, Lobes rounded
5766 Stem prickly
5767 Leaves smooth, Lobes divaricate acute 2-nerved, Petals lanceolate
5768 Leaves at the base nearly transverse, Lobes lanceolate porrect 3-nerved, Petals lanceolate
5769 Leaves cordate, Lobes porrect acute 3-nerved, Petals lanceolate
5770 Racemes axill and term nodding, Petals linear, Lobes of leaves rounded smooth
5771 Cal 1-leaved bursting, Petals sessile ovate, Lobes of leaves ovate obtuse
5772 Leaves cordate downy beneath, Lobes ovate obtuse, Cal narrowed upwards lengthened
5773 Flowers triandrous, Lobes of leaves oval obtuse
5774 Leaves cordate, Lobes half orbicular downy
5775 Leaves ovate, Lobes acuminate half-ovate spreading
5776 Stem prickly, Leaves cordate with porrect 4-nerved lobes

5777 Leaves alternate abruptly pinnated, Pod woody, Seeds black with a scarlet arillus

5778 Leaflets coriaceous veinless unequal at base, Flowers of panicle stalked
5779 Leaves veiny unequal at base, Panicle wavy spreading, Pedunc. many-fl Pods warted

and Miscellaneous Particulars



parted, which circumstance gave occasion, it is said, to Plumier to name this genus from the two brothers They merit a place in the stove, where they are easily cultivated in light loamy soil, and cuttings taken off when the plants are in a growing state, not over ripened, nor yet quite succulent, with their leaves on, will do well in sand under bell-glasses in moist heat. The species rarely flower in this country In their native woods they are great ornaments of the trees, among which they climb in every direction The stem of Bauhinia scandens, which had twined around a smaller plant, is said to have been the origin of Æsculapius's snaken rod, which he brought from India

971. *Afzelia* Named by Sir J E Smith, after Dr Adam Afzelius, an amiable and excellent Swedish botanist, resident for many years, in the service of the African Company, at the colony of Sierra Leone, and now living at Upsal.

972 *Hymenæa* A poetical application of this plant, the leaves of which grow in pairs, to Hymen, the god of marriage *Courbaril* is a vernacular American name This tree is abundant in the West Indies, where it grows to a large size, with a spreading head It has stiff sub-perfoliate leaves obliquely placed, and terminal spikes of flowers, which are succeeded by thick, fleshy, brown pods, shaped like those of the garden bean, they are six inches long, and two inches and a half broad, of a purplish brown color, and a ligneous consistence, with a large suture on both edges; they contain three or four roundish compressed seeds, divided by transverse partitions, and inclosed in a whitish substance of fine filaments, as sweet as honey. The Indians eat this substance with great avidity, though it is apt to purge when fresh gathered, but it loses this quality as it grows old.

Between the principal roots of the tree exudes a fine transparent resin, yellowish or red, which is collected in large lumps, is called gum Anime, and makes the finest varnish that is known, superior even to the Chinese lacca for this latter use it is dissolved in the highest rectified spirits of wine It burns readily, and with a clear flame, emitting a grateful and fragrant smell, for which reason it is sometimes ordered by way of fumigation in the chambers of persons laboring with asthmas or suffocative catarrhs Its vapours not only strengthen the head, but all parts of the body affected with cold. Some apply it outwardly, dissolved in oil or spirits of wine, to strengthen the nerves An oil may be distilled from it, useful in palsies, in cramps, and

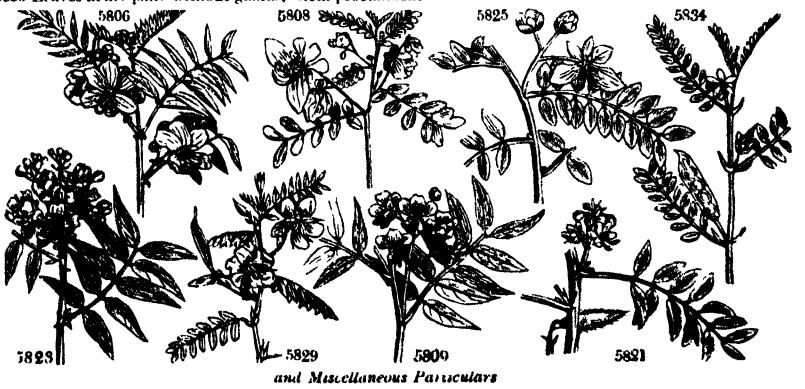
History, Use, Propagation, Culture,



contractions of the sinews The solution in spirits has been thought not inferior to Guaiacum in venereal cases. A decoction of the leaves expels flatulency, and gives ease in colicky pains, by gently opening the bowels, and the inward bark is an excellent vermifuge in substance or decoction

The tree is excellent timber, but it must be very old before it is cut, otherwise the heart will be but small. It is in great request for wheel-work in the sugar-mills, particularly for cogs to the wheels, being extremely hard and tough it is so heavy, that a foot cube weighs about a hundred pounds, and it will take a fine polish It is much inhabited by wild honey bees. (*Browne*)

Besides this locust-tree, there is the American tree of that name, Robinia Pseud acacia, and the locust-tree of scripture, Ceratonia siliqua

5780 Flowers growing upon the trunk

5781 Leaves 1 pair and calyxes smooth, Stipules cordate-lanceolate
5782 Leaves 2 pairs obovate, Two subulate glands between the lower pair
5783 Leaves 2 pairs ovate oblong acuminate, An obl. gland between the lower pair, Spines obsolete 3-toothed
5784 Leaves 2 pairs ovate oblique, An obtuse gland between the lowest, Racemes axill stalked
5785 Leaves 3 pairs with a gland on the footstalk, Stipules ciliate cordate acuminate
5786 Leaves 3 pairs obovate outer largest, A subulate gland between the lower pair
5787 Leaves 3 pairs obovate smooth the inner roundest with a globose gland between
5788 Leaves 3 pairs, Leaflets obtuse elliptical, A gland between the lower leaves
5789 Leaves 3 pairs, Leaflets ovate acuminate, A sessile gland between the leaflets
5790 Leaves 3 pairs ovate acuminate with soft down on each side
5791 Leaves 3 pairs lanceolate subfalcate smooth, A gland between the lowest, Corymbs stalked, Pods cylind.
5792 Leaves about 4 pairs ovate, Flowers racemose irregular, Stem arborescent
5793 Leaves 3 pairs obovate obtuse beneath very villous outer largest, A gland between lowest, Pods recurved
5794 Leaves 3 or 4 pairs obovate the outer largest, A gland between the lower pairs, Pods pendulous rounded
5795 Leaves 4 pairs ovate hairy with a subulate gland between the leaflets, Peduncles 4-flowered
5796 Leaves 4 pairs obovate pubescent ciliated, A stalked gland between all, Pedunc 4-fl Pod jointed
5797 Leaves 4 or 5 pairs oblong obtuse the outer the largest with a gland between every pair
5798 Leaves 5 pairs ovate lanceolate rough at edge. outer largest, A gland at foot of leafstalk
5799 Leaves 5 pairs oblong acute smooth, A gland at base of footstalk, Branches smooth
5800 Leaves 5 pairs elliptical smooth with an obl. gland between the lower, Stip subul falcate, Rac axillary
5801 Leaves 5 pairs elliptical smooth, An oblong gland between the lower, Racemes axillary
5802 Leaves 5 pairs cordate obtuse, Stalks without glands
5803 Leaves 6 pairs obovate smooth, Stalks without glands, Spikes racemose, Pods leafy compressed falc ate
5804 Leaves 5 pairs lanceolate equal, Gland above the base of the leafstalks
5805 Leaves 6 pairs ovate lanceolate smooth with a gland at the base of the stalk, Pod compressed edged
5806 Leaves 8-9 pairs ovate lanceol hairy with a gland at base of stalk, Racemes many-fl shorter than leaves
5807 Leaves 6 pairs lanceolate acute the outer largest, A gland on leafstalk, Peduncles 2 flowered
5808 Leaves 6 pairs obl smooth lower smaller with a subulate gland between the lowest, Stalks 2-flowered
5809 Leaves 6 pairs ovate acute smooth, with a gland at the base of the stalk, Pod cylindrical hooked
5810 Leaves 5-6 pairs ovate acuminate woolly the outer largest
5811 Leaves 6 or 8 pairs lanceolate acute smooth, with a gland on the leafstalk, Pod round smooth
5812 Leaves 2 pairs obovate veiny, Stipules lanceolate appressed, Leaflets nearly equal
5813 Leaves 10 pairs oblong obtuse without glands, Racemes long, Bractes ovate tumid imbricated
5814 Leaves 6-8 pairs linear obliquely rounded at base above hairy, Panic axillary, Pod villous
5815 Leaves in many pairs with many glands, Stipules subulate
5816 Leaves 2 pairs velvety without glands
5817 Leaves 5 pairs ovate lanceolate smooth with a gland at the base of the leafstalk
5818 Leaves 6-9 pairs lanceolate acuminate smooth, A gland on the leafstalk
5819 Leaves 8 pairs ovate-lanceolate, A gland between the lower, Stipules ovate very large
5820 Leaves 10 pairs ovate-lanceolate obtuse mucronate smooth, Stalk without gland
5821 Leaves 8 pairs ovate-oblong equal, Gland at the base of the leafstalk
5822 Leaves 8 pairs oval-oblong the outer smaller, Leafstalks without glands, Stipules spreading
5823 Leaves 7 pairs lanceolate the outer smallest, A gland at base of leafstalk
5824 Leaves 6 pairs oval-obl obt hairy the outer largest, A subulate gland between each pair, Pods linear
5825 Leaves 9 pairs oval-obl smooth obt. A cylindrical gland between the lowest, Footst. with no gland at base
5826 Leaves 10 pairs lanceolate with an oblong gland at the base
5827 Leaves 10 pairs, Leaflets oblong rounded at each end beneath hoary, No gland on stalk, Pod compressed
5828 Leaves 12 pairs obtuse mucronate, Glands many subulate, Stipules reniform bearded
5829 Leaves many pairs, Gland of the footstalk stalked, Stipules ensiform
5830 Branches hairy, Stipules lanceolate linear with elevated lines, Leaflets cuspidate
5831 Leaves 15 pairs, Leaflets with a cartilaginous white edge and a subulate gland between every pair
5832 Leaves many pairs linear with an obsolete gland at the base of the leafstalk, Stipules setaceous
5833 Leaves many pairs linear mucronate with a gland between the lowest, Pedunc solitary 1 fl.
5834 Leaves many pairs, Flowers pentandrous, Stem erect
5835 Leaves many pairs linear, Stem flexuose erect villous The plant in Bot Cab is something else?
5836 Leaves many pairs without glands, Stem procumbent

and Miscellaneous Particulars

973 *Cynometra* A name contrived to indicate the peculiar form of the pods of this genus, which grow from the old stems and branches of the tree Large cuttings root best planted in sand, and plunged in heat under a hand-glass

974 *Cassia* According to Olaus Celsus, this name is to be traced to the Hebrew, *Ketzoth*, rendered by Κασιαν in the Septuagint, and Latinized by *Cassia*. Cuttings of the species, which do not seed freely, root in pots of sand, in moist heat, and covered by a hand-glass.

Of the trivial names of different species of Cassia, that of *Absus* is the name under which it is described by Professor Alpinus, and is supposed to have arisen from a river of Palestine of that name *Tagera* is a Malabar name, *Sophera*, an Egyptian name, and *Senna*, the Arabic name of the plant — *Sænna*.

History, Use, Propagation, Culture,

975 *Cathartocarpus* From καθαιρω, to purge, and καρπος, fruit, the fruit of the species being a strong cathartic The species may be treated as Cassia

976. *Parkinsonia* So named by Plumier, in memory of John Parkinson, apothecary, of London, author of Paradisus Terestris, 1629, and Theatrum Botanicum, 1640 It is a handsome low tree, not unlike the Laburnum, and planted in the West Indies near houses, as the latter is in this country.

977 *Poinciana* So named by Tournefort, in memory of De Poinci, governor of the Antilles, placed by Linnæus among the promoters of botany

P pulcherrima is a low spiny tree, with an odor, when the leaves are bruised, like savin It is a native of both Indies, and in Barbadoes is planted in hedges, whence the name of flower-fence, or Spanish carnations, which it is there called In our stoves they require a strong heat to make them flower well. They are readily increased either by cuttings or seeds

978 *Cæsalpinia* So named by Plumier, in honor of Andreas Cæsalpinus, chief physician to Pope Clement VIII, and the father of systematic arrangement in plants, in his now very scarce work, entitled, De Plantis, libri sedecim, Flor 1583 He died at Rome in 1602 The wood of all the genus may be used in dying In our stoves the plants are thorny, and, therefore, not being much liked, are seldom suffered to grow large enough to flower freely

C sappan is a prickly tree, with the heart of the wood red, heavy, and very hard: it dyes a beautiful red, which, however, is said not to stand It is very durable in sea-water, and exported abundantly by the Chinese for trenails in ship-building, and as a dye

C crista and brasiliensis afford the Brazil wood used in dying, and extensively imported to England from the West Indies The timber of the last species is elastic, tough, and durable, and takes a fine polish, it is of a beautiful orange-color, full of resin, and yields a fine full tincture by infusion The best Brazil wood is said to be produced by Cæsalpinia echinata Cuttings, Sweet observes, will not root freely, but will sometimes succeed if taken off in a growing state, but not too young, and plunged in a pot of sand, under a hand-glass, in moist heat (*Hot Cult* 32)

979 *Guilandina* Named after Melchior Guilandin, a Prussian traveller in Africa, and demonstrator of Botany at Padua He died in 1590 The species are all fine trees, with large compound leaves.

980. *Hyperanthera* From ὑπερ, upon, and ανθηρα, an anther The five barren stamens of this

5837 Leaves 5 pairs
5838 Leaves 12 pairs

5839 The only species

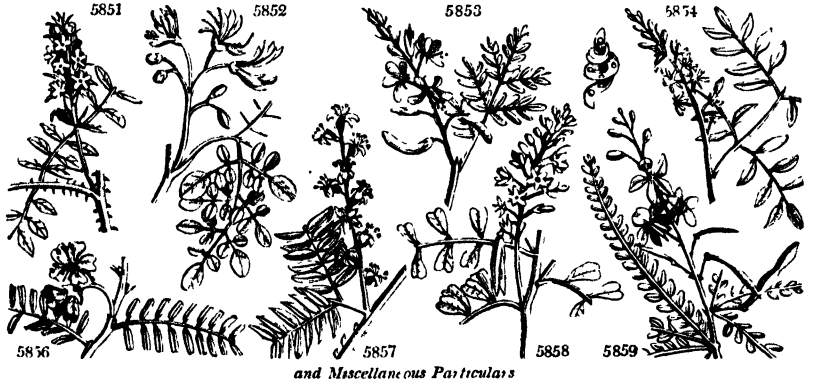
5840 Prickly, Calyxes unequal smooth
5841 Unarmed, Calyxes equal downy

5842 Prickly, Leaves doubly in 2 pairs, Leaflets obcordate and calyxes smooth, Stam as long as corolla
5843 Unarmed, Leaflets ovate-oblong, Rachis pubescent, Cal downy, Stamens shorter than corolla
5844 Prickly, Leafl obl oval unequ sided obt and cal smooth, Stamens longer than cor Upper petal very small
5845 Prickly, Leaflets oval, Racemes simple, Petals ovate shorter than the smooth calyx
5846 Prickly, Leaflets oblong obtuse, Stamens shorter than cor Pods woolly
5847 First petiole prickly beneath, Leaflets acute and cal smooth, Pods 1-2-seeded
5848 Stipules spiny, Leaflets oblong retuse, Leafstalks hairy
5849 Prickly, Leaflets oblong obtuse mucronate smooth
5850 Unarmed, Leaflets unevenly bipinnate, Leaflets elliptical obtuse mucronate dotted

5851 The only species

5852 Flowers half decandrous, Leaves about bipinnate, Lower leaflets ternate, Pods 3-cornered

5853 Stem decumbent, Leaves bipinnate ovate glaucous



5854 Leaves decompound smooth on each side
5855 Leaves decompound downy beneath

5856 The only species

5857 The only species Branches spiny, Leaves alternate conjugate

5858 The only species Leaves abruptly pinnated, Leaflets obcordate

5859 The only species

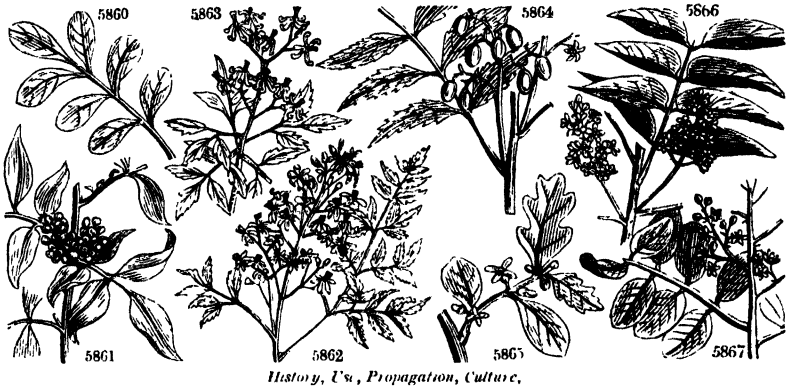
and Miscellaneous Particulars

genus are surmounted by the five fertile ones (*Lahl*) Cuttings root best under a hand-glass in sand

981 *Hoffmanseggia* Named by Cavanilles, after John Charles Hoffmansegg, whom he calls a distinguished naturalist It may be with some propriety be employed to commemorate the merits of the present distinguished Count Hoffmansegg Cuttings, somewhat ripened, root under a hand-glass in sand

982 *Adenanthera* From ἀδην, a gland, and ἀνθηρα, an anther The essential character of the genus is to have each anther tipped with a gland Large cuttings, with the leaves not shortened, root best in a pot of sand plunged in heat under a hand-glass (*Bot Cult* 13)

983 *Cadia* Contrived by Forskahl, from the Arabic name of the plant, — *qadhy*



984 *Prosopis* One of the names under which Dioscorides described the Acrtium Lappa The present plant has no sort of resemblance to that of the ancients. It is a leguminous plant, and the pods are eaten as a condiment in India.

985 *Hæmatoxylon* From αἱμα, blood, and ξυλον, wood, in allusion to the color of an infusion of its wood. The logwood of commerce This is a crooked stemmed low tree, with pinnate leaves, originally from the Bay of Campeachy, the inner bark and wood red, the latter dark and very hard It makes an excellent fence, the smaller shoots are cut for hoops, and the stems for exportation for dying The gum is a gentle subastringent. In our stoves it grows well in loam and leaf-mould, kept rather moist, and cuttings root in sand under a hand-glass in heat.

986 *Copaifera* This tree is so called from bearing the drug Copaiba, which is the name given to the tree itself by the people of Brazil *Beaume de Copahu*, Fr, *Kopaiva Balsam*, Ger, *Balsamo del Copapiba*, Ital. This is a lofty elegant tree, with a handsome branching head, the extreme branches flexuose at the axils, the bark ash-colored, and the leaves pinnate It grows abundantly in the woods of Tolu, near Carthagena, and of Quito, in Brazil The copaiba balsam of the shops is procured by wounding or boring these trees to the pith, near the base of the trunk, when it flows abundantly, in the form of a clear colorless liquid, which is thickened, and acquires a yellowish color by age The operation is performed two or three times in the same year, and from the older trees the best balsam is obtained.

Copaiba balsam is stimulant, diuretic, and gently purgative It has been recommended in pulmonary complaints, and it certainly affords considerable relief in hæmorrhoidal affections. (*Thomson's London Dispensatory*, 265.) It may be increased by ripened cuttings in sand under cover.

History, Use, Propagation, Culture,

987 *Trichilia* From τριχα, ternary, nearly all the parts of the plant, the leaves, the stigmas, the cells of capsule, the seeds, being produced by threes T glabra is a tall branching tree, with an unpleasant fœtid smell The species are rarely seen in collections, and seldom, when cultivated, flower

988 *Melia* Μελια was the Greek name of the manna ash, from μελι, honey. This tree has been thought to resemble the ash in its foliage

M azedarach *azadaracht*, Arab) grows to a large tree in the south of Spain and Italy, producing long loose bunches of blue flowers, succeeded by pale yellow berries, about the size of a cherry These berries consist of a pulp, which is poisonous in a high degree, and mixed with grease, will kill dogs, enclosing a nut which is bored and strung as beads by the Catholics

M sempervirens is considered by some as only a variety of the Azedarach

989 *Quivisia* The tree is called *Bois de Quivi* in the Isle of France

990 *Swietenia* So named by Jacquin, in honor of the illustrious Gerard L B Von Swieten, archiater to Maria Teresa, Empress of Germany, who at his persuasion founded the botanic garden at Vienna.

S mahagoni The mahogany tree is a lofty branching tree, with a wide handsome head, the flower of Melia, and the fruit of Cedrela, about the size of a turkey's egg It grows in the warmest parts of America, as in Cuba, Jamaica, Hispaniola, &c The trees on the Bahama islands are not so large, but are more curiously veined, and are known in Europe as Madeira wood They generally grow on the solid rock, where there seems to be no earth for their nourishment Mahogany, like other timber, varies in durability, firmness of grain, and other circumstances, with the soil on which it is grown The best is furnished from the rocky soils of St. Domingo and the Bahama islands

S febrifuga is a lofty tree, in general apearance like the Mahogany The wood is of a dull red color, remarkably hard and heavy, it is reckoned by the natives the most durable wood they know, and on that account is used for all the wood-work in their temples, it is also very serviceable for various other purposes The bark is internally of a light red color a decoction of it dyes brown of various shades, according as the cloth has been prepared Its taste is a bitter and astringent united, and very strong, particularly the bitter, at the same time not any way nauseous or otherwise disagreeable In India it is used for the cure of intermittents with considerable advantage, and has also been found efficacious in most of the diseases in which the cinchona bark proves serviceable (*Thompson's London Dispensatory*, 533)

991 *Ekebergia* Charles Gustavus Ekeberg was a Danish naturalist, who travelled in Asia from 1770 to 1771 Cuttings to succeed must have their leaves entire, and be planted in sand and covered.

992 *Heynea* Named after Dr Benjamin Heyne, a learned German botanist and physician, who travelled many years in India, where he formed a large collection of dried plants

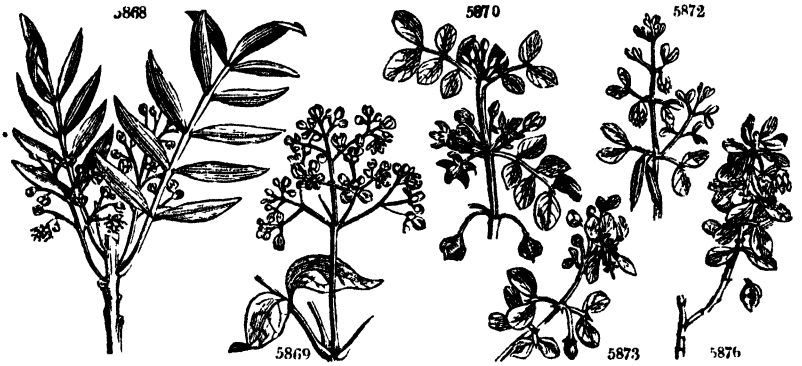
993 *Guaiacum* From *guaiac*, the name given to the tree by the natives of Guiana. *Gïjuac*, Fr , *Guajakgumma*, Ger , *Guajaco*, Ital. This tree rises forty feet high, and is four or five feet in circumference, with many divided knotted branches, greyish bark, and abruptly pinnate leaves. It has blue flowers, which are succeeded by compressed berries of a roundish form The tree takes many years to arrive at its full growth The roots run far into the ground perpendicularly, contrary to the usual growth of timber trees in the West Indies, which generally shoot the largest prongs of their roots in a horizontal direction, and are commonly observed to run very near the surface The bark is thick and smooth, the wood of a dark olive color, and cross grained, the strata running obliquely into one another, in form of an X It is a valuable timber where

5860 Leaves pinnated smooth, Outer leaflets largest
5861 Leaflets lanceolate undulate, Flowers with 4 petals

5862 Leaves bipinnate, Leaflets smooth somewhat quinate
5863 Leaves bipinnate, Leaves cut rugose shining about 9, Petiole rounded at base
5864 Leaves pinnate

5865 Leaves alternate oval and obovate entire sinuate-toothed or pinnatifid, Pedicels twin axillary 1-flowered

5566 Leaves pinnate in four pairs, Leaflets ovate-lanceolate equal at base, Panicles axillary
5867 Leaves pinnate in four pairs, Leaflets elliptical rotundish emarginate unequal at base, Panicle terminal



5868 The only species, Leaves pinnated with an odd one, Panicles axillary

5869 Leaves pinnated with an odd one in 3 pairs, Pan. axill. on long stalks

5870 Leaflets of 2 or 3 pairs obtuse, Capsules 2-celled

5871 Leaves simple opposite sessile roundish
5872 Leaves conjugate stalked, Leaflets obovate, Peduncles erect, Calyx smooth
5873 Leaves conjugate stalked, Leaflets obovate, Flower nodding, Calyx pubescent

5874 Leaves conjugate stalked, Leaflets linear-lanceolate
5875 Leaves conjugate stalked, Leaflets clavate fleshy with a cobweb surface

and Miscellaneous Particulars

strength and duration is required, and weight no object. It takes a fine polish, turns well, and is much used for ship blocks. It is one of the most valuable trees of the West Indies, since the timber, the bark, fruit, leaves, and blossom, are all applicable to some useful purpose The wood yields by incision the peculiar substance called Guaiacum, erroneously termed a gum, of great importance in medicine.

All the parts of this tree possess medicinal qualities, but the wood and the peculiar substance afforded by it are the only parts used the virtues of the wood depend altogether on the peculiar matter it contains. This is spontaneously exuded from the tree, and is called native gum. it concretes in tears, which are semipellucid, and very pure, but the greater part of it is obtained by making incisions into the trunk, or, as it is termed, jagging the tree. This operation is performed in May, and the juice which flows copiously, is concreted by the sun It is also obtained by sawing the wood into billets, and boring a hole longitudinally through them, so that, when one end of a billet is laid on a fire, the guaiac melting runs through the hole from the opposite end, and is collected in a calabash Boiling the chips or raspings in salt and water also separates the guaiac, which, as it rises to the surface, may be collected by skimming

Both the wood and the guaiac are stimulant, diaphoretic, diuretic, and purgative. The wood was introduced into Europe by the Spaniards as a remedy for lues venerea in 1508, and gained much celebrity from curing Van Hutten; but it had long before been used for the same purpose by the natives of St. Domingo It obtained so much reputation, that the exhibition of mercury was discontinued for a considerable length of time, and even in the eighteenth century its specific powers over this disease were maintained by Boerhaave, but frequent disappointments and more correct observations have shown that it possesses no powers of eradicating the venereal virus, and that it is useful only after a successful mercurial course, for repairing the strength and vigor of the system, "and where a thickened state of the ligament, or of the periosteum, remains, or where there are foul indolent ulcers," (*Pearson's Observations*, &c p 10) or in suspending the progress of some of the secondary symptoms for a short time, as ulcers of the tonsils, eruptions, and nodes. The decoction of the wood has been found more useful in cutaneous diseases, scrofulous affections of the membranes and ligaments, and in ozæna. The guaiac itself is an efficacious remedy in chronic rheumatism and arthritic affections, as well as those diseases for which the decoction of the wood is usually given; and in every respect it may be regarded as the active ingredient of the wood Its sensible effects are a grateful sense of warmth in the stomach, dryness of the mouth and thirst, with a copious flow of sweat, if the body be kept externally warm, or if the guaiac be united with opium and antimonials: but when the body is freely exposed, instead of producing diaphoresis, it augments considerably the secretion of urine (*Thomson's London Dispensatory*, 318.)

Lignum vitæ in the stove grows freely in loam and peat. "Cuttings," Sweet observes, "are generally supposed to be difficult to root, but I find ripened cuttings, taken off at a joint, root readily, planted thin in a pot of sand, and plunged under a hand-glass in heat When the cuttings are rooted, which will be easily perceived by their growing at the top, they should be potted off, when great care must be taken not to break off the young roots in taking the sand from them, as they are very small and easily broken Pot them off in very small pots, and keep them under a close glass or a few days, till they have struck fresh root, when they must be exposed to the air by degrees" (*Bot. Cult.* 63.)

994. *Zygophyllum.* From ζυγος, a pair, and φυλλον, a leaf; all the leaves grow in pairs. *Morgsana*, which is the name of one species, is the Syrian name of the plant. These are plants of little ornament, generally with fleshy leaves, and flowers of a yellow or whitish yellow color.

History, Use, Propagation, Culture.

995 *Fagonia* So named by Tournefort, in honor of Mons. Fagon, archiater to Louis XIV., and a great patron of botany Small prickly plants of no beauty

996. *Tribulus* From τρεις, three, and βολος, a point, in reference to the points of the capsules *La Croix du Chevalier*, Fr. The term *Caltrops* is taken from the form of the fruit, which resembles the machines that were formerly cast in the way to obstruct an enemy's cavalry It is composed of five nuts, united into a subglobular whorl armed with prickles

T terrestris is a native of most of the hot and temperate parts of the world · it is common about Kingston in Jamaica, where it is called Turkey blossom, and planted in gardens for the sake of its flowers, which have an agreeable smell The fowls are observed to feed much on them, which is thought both to fatten them and heighten their flavor In the south of Europe, it is a common weed in arable land, and is troublesome to cattle by the prickly fruit running into their feet. All the species are pretty, though seldom cultivated.

997. *Dictamnus* An ancient name of what is now supposed to be the Origanum Dictamnus *Fraxinella*, Fr., in allusion to the remarkable similarity which exists between the leaves of the plant and Fraxinus, the ash. The whole plant, especially when gently rubbed, emits an odor like that of lemon-peel, but when bruised it has something of a balsamic scent. This fine scent is strongest in the pedicels of the flowers, which are covered with glands of a rusty red color, exuding a viscid juice or resin, which exhales in vapor, and in a dark place may be seen to take fire The root is used in medicine, and, it is said, with much success, as an opiate and drastic

998 *Ruta* This name is nearly the same in all languages. Πηγανη, in Greek, *Ruta*, in Latin, *ruz*, in Runic, *rude*, *ruta*, or *rutu*, in Anglo-Saxon, *rutiza*, in Sclavonic; in French and English, *rue*, &c. The root of the word is beyond the ingenuity of etymologists R. graveolens was formerly in much repute as a medicinal plant, and also as emblematical of repentance and grace In Shakspeare and other old authors, it is called herb of grace, as rosemary is called herb of remembrance. The leaves have a powerful unpleasant odor, and a hot, bitter, nauseous taste In the recent state they will inflame and blister the skin; but much of this is dissipated in drying Medicinally, rue is stimulant and antispasmodic, and is supposed to possess emmenagogue powers It was in high estimation as early as the time of Hippocrates, who frequently ordered it in female complaints. In modern practice, it is chiefly used in hysteria and flatulent colic. (*Thomson's London Dispensatory*, 487)

999. *Crowea.* So named by the president of the Linnean Society, after his friend James Crowe of Norwich, an excellent British botanist, whose collection of willows we believe still exists This plant continues in flower the greater part of the year. An equal mixture of sandy loam and peat is the best soil for it, and care must be taken not to over water it, or it will look yellow and unhealthy. It likes an airy situation,

5876 Leaves conjugate stalked, Leaflets obovate, Stem shrubby
5877 Leaves conjugate sessile, Leaflets lanceolate oval rough at edge, Stem shrubby
5878 Leaves with double leaflets stalked, Leaflets cylindrical fleshy smooth, Petals acuminate

5879 Spiny, Leaflets lanceolate flat smooth
5880 Spiny, Leaflets linear convex

5881 Leaflets in 4 pairs. the outer larger, Pericarps 10-seeded blunt
5882 Leaflets in 6 pairs nearly equal, Seeds with four horns
5883 Leaflets in 8 pairs nearly equal

5884 Leafstalk obscurely edged
5885 Leafstalk scarcely edged at all

5886 Leaves supradecompound, Leaflets oblong terminal obovate, Petals entire
5887 Leaves supradecompound, Leaflets all linear, Petals entire
5888 Leaves supradecompound oblong, Terminal leaflet obovate, Petals toothed
5889 Leaves supradecompound, Lobes oblong cuneate nearly equal, Bractes very small ovate, Petals ciliate
5890 Leaves pinnate, Leaves lanceolate attenuate at base serrate crenate, Petals entire
5891 Leaves mostly ternate lanceolate pubescent lateral very short, Cal and ovaries villous
5892 Leaves simple lanceolate smooth, Filaments ciliated, Stem simple herbaceous
5893 Leaves in middle ternate linear narrowed at the base entire, Calyxes villous
5894 Leaves pinnatifid, Segments oblong somewhat stalked the terminal very large, Petals ciliated
5895 Leaves bipinnate with obovate retuse leaflets, Flowers 4-petalous 8-androus

5896 The only species

5897 The only species

5898 Leaves ovate-lanceolate acuminate serrated at end, Cal as long as cor. Berries ovate
5899 Leaves lanceolate entire very obtuse at end, Branches of panicle short angular

5900 Flowers hermaphrodite, Leaves pinnate with an odd one, Leaflets opposite sessile, Stalk jointed winged
5901 Flowers monœcious, Leaves abruptly pinnated, Leaflets alternate stalked, Stalk naked

and Miscellaneous Particulars.

and not to be crowded amongst other plants. Cuttings strike root freely in sand, under a bell-glass. (*Bot. Cult* 173)

1000 *Codon* From *κωδων*, a bell The corolla of this plant is globular, and formed like a bell in its upper part A scarce Cape shrub, of which Thunberg speaks in terms of great delight upon finding a solitary individual growing by the side of a precipice in its native country

1001. *Gomphia.* From *γομφος*, a club, but the application is not obvious These are most beautiful tropical bushes, with long spikes of brilliant yellow flowers, and neat serrated shining entire leaves.

1002 *Quassia* So named by Linnæus, in memory of Quass., a negro slave of Surinam, who found and discovered to Rolander, a Swede, the wood of Q excelsa, which he had employed with success as a secret remedy in the malignant endemic fevers of Surinam

Q amara is a lofty tree with strong branches, white light wood, their bark and leaves not unlike those of the common ash. The flowers are in terminal racemes, of a bright red The root, wood, bark, and indeed all the parts of this tree are intensely bitter Linnæus says that the wood of the root is a noble remedy, but that the wood of the small branches, which has since been substituted for it, is good for nothing The wood of both is now thought to be less intensely bitter than the bark, which is at present regarded as the most powerful medicine. Quassia has no sensible odor; its taste is that of a pure bitter, more intense and durable than that of almost any other known substance: it imparts its virtues more completely to watery than spirituous menstrua, and its infusions are not blackened by the addition of martial vitriol. It is said that considerable quantities of this drug are used by the brewers instead of hops

Q Simaruba, or mountain damson, as it is called in Jamaica, is a tall tree with alternate branches, and a smooth grey bark, maculated with yellow spots The leaves are pinnate; the flowers are male and female on the same axillary panicles, yellowish white; the fruit consists of five smooth, ovate, black, one-celled berries, on a common receptacle, and open spontaneously when ripe.

The officinal part of this tree is the bark of the root, It is inodorous, and has a bitter, but not disagreeable taste The pieces are of a very fibrous texture, rough, scaly, warty, and of a full yellow color in the inside when fresh. Alcohol and water take up all its active matters by simple maceration, at a temperature of sixty degrees of Fahrenheit better than at a boiling heat, it is tonic, and has been employed with advantage in intermittent fever, obstinate diarrhœa, dysentery, and dyspeptic affections. (*Thomson's London Dispensatory*, 462)

The different species of quassia flower freely in the stove; are of easy culture in loam and peat, and are increased by ripened cuttings taken off at a joint, and not deprived of their leaves, and planted in a pot of sand under a hand-glass.

History, Use, Propagation, Culture,

1003 *Limonia* The general denomination of the citron in Arabia is *lymoûn*, whence limon and lemon, to which fruits this genus is nearly related L monophylla is a small thorny tree, with a berry the size of a small nutmeg, very like a lime, and called by the Hindoos wild lime. Ripened cuttings of the species root in sand, under a hand-glass plunged in a moist heat

1004. *Glycosmis* From γλυκυς, sweet, and οσμη, smell, all the parts of the plant, leaves, flowers, fruit, having an agreeable perfume G pentaphylla is an elegant fragrant shrub, very common in most uncultivated lands in Coromandel, but chiefly under large trees, where birds have dropped the seeds It flowers all the year there. The whole plant, when drying in the shade, diffuses a pleasant permanent scent, the flowers are exquisitely fragrant, birds eat the berries greedily

G arborea has also very fragrant flowers

G citrifolia is a beautiful stove plant, not, indeed, remarkable for the showiness of its flowers, but most valuable on account of its fruit, which is about the size of a hazel nut, very juicy and sweet, and produced in profusion in our stoves

1005 *Murraya* So named by Koenig, in honor of John Andrew Murray, knight of the Swedish order of Vasa, professor of medicine and botany at Gottingen, and an editor of Linnæus's Systema Vegetabilium. The species are trees of the smallest size, with dotted pinnated leaves and fragrant white flowers, quite like those of an orange

1006 *Cookia* Named by Sonnerat in honor of our celebrated Captain Cook The fruit is much esteemed in China, where it arrives at the size of a pigeon's egg, growing in bunches, and it is called Wampee It grows well in light loam, and ripened cuttings with their leaves on root in sand in a moist heat

1007 *Gærtnera* In memory of Joseph Gærtner, M D F R S Acad. Imp Petrop Memb, author of a most excellent work on the fruits and seeds of plants, Stutg. 1788 It is a large climbing woody shrub, cultivated all over the coast of Coromandel, on account of the beauty and fragrance of its flowers. In the stove it requires a good deal of room to flower freely It is easily increased in sand under a hand-glass. The genus is now referred to the natural order of Malpighiaceæ, among which it is remarkable for its white flowers.

1008. *Monotropa* From μονος, one, and τρεπω, to turn · its flowers are all turned one way It is parasitical and without leaves, of a pale uniform hue, having a simple scaly stem, allied in habit to Orobanche, to some of the Orchis tribe in its peculiarity of scent, which is like that of primrose, or beans in blossom. The root is fibrous, much branched, and somewhat creeping, growing among dead leaves or in half decaying vegetable mould. Sir J E. Smith says, he could never find it truly parasitical In Sweden, Linnæus informs us, it is given dry to sheep affected with a cough

Its natural affinity, which is certainly to the heath, Pyrola, and similar plants, is very singular and unexpected.

5902 Leaves simple, Spines solitary
5903 Leaves pinnate, Leaflets oblong lanceolate crenulate, Spines solitary

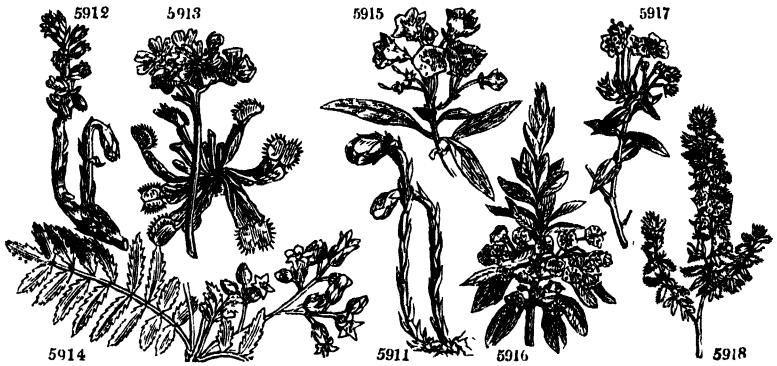
5904 Leaves simple and 3-leaved, Leaflets ovate-oblong acuminate, Peduncles axillary shorter than stalk

5905 Leaves pinnate in 2 pairs, Leaflets elliptical entire
5906 Leaves pinnate in 2 pairs, Leaflets oblong obsoletely serrate

5907 Leaflets ovate, Peduncles many-fl corymbose
5908 Leaflets ovate-acuminate, Pedunc. axill. and solitary

5909 Leaves ovate-lanceolate acuminate nearly equal at base

5910 Leaves pinnated, Leaflets ovate-lanceolate



5911 Large cernuous, Scales close together
5912 Flowers smooth lateral octandrous

5913 The only species

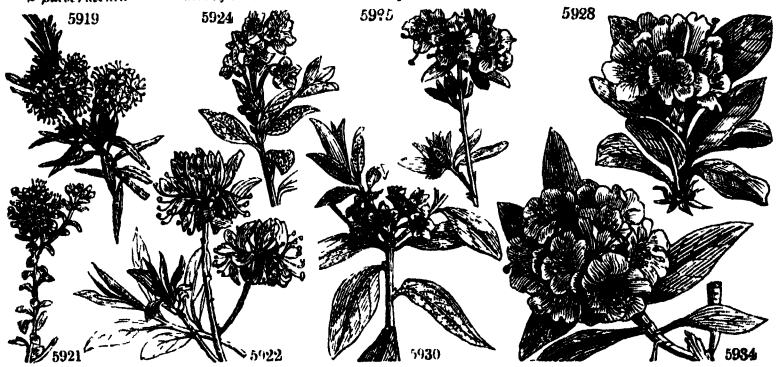
5914 The only species

5915 Leaves ovate-elliptical ternate and scattered, Corymbs terminal
5916 Leaves oblong, Corymbs axillary, Bractes linear-lanceolate, Pedunc and calyx downy with glands

5917 Leaves opposite oblong polished beneath glaucous revolute at edge, Branches 2-edged
β Leaves linear more revolute green beneath
5918 Leaves alternate and opposite ovate-lanceolate and branches hairy, Pedunc. axill 1-flowered

and Miscellaneous Particulars

1009 *Dionæa.* One of the names of Venus It is a singular plant in respect of its leaves, which are of an anomalous form, and have a singular motion by which they catch insects, whence the specific name, *muscipula*, a fly-trap The root is scaly, almost like a bulb, and not prolific in fibres The leaves have the petiole winged as in the orange; the extreme part, or proper leaf, is the part that operates as a trap Linnæus affirms, that when the entrapped insect ceases to struggle and is quiet, the leaf opens and permits it to escape This does not agree with Ellis's account, for he affirms that the lobes never open again, so long as the animal continues there He thinks it probable, that a sweet liquor discharged by the red glands tempts the insect to its destruction He adds, that if a straw or a pin be introduced between the lobes, they will grasp it as fast as if it were an insect The flowers grow in a corymb resembling an umbel It is rather difficult to preserve Sweet finds it "thrive best when planted in a pot of Sphagnum with a little mould at the bottom of the pot, and placed in a pan of water" Shepherd, of the Liverpool botanic garden, finds that leaves of Dionæa so placed will root and form new plants In all cases it is necessary that an abundance of fresh cool air should be supplied to the plants



1010 *Garuga* *Garugo* is the Telinga name of the plant, which is rare in our stoves, although not of recent introduction

1011. *Kalmia* So named by Linnæus in honor of Peter Kalm, professor at Abo in Sweden, author of Travels in America The species are beautiful peat earth shrubs, deserving a place in every American ground K. latifolia is a native of Carolina and other parts of North America, of Pennsylvania, New York, &c. but only in particular places; on rocks, hanging over rivulets, and on the sides of barren hills on the most sterile soil The noxious qualities of this elegant shrub lessen that esteem which its beauty claims, for though deer feed on its green leaves with impunity, yet when cattle and sheep, by severe winters deprived of better feed, eat the leaves, many die annually It blossoms in May, and continues in flower a great part of the summer (*Catesby*) The flesh of the American partridge is said to be poisonous in the winter from its feeding upon the buds of this plant. But Wilson denies this statement. The Indians use a decoction of the leaves for purposes of self-destruction A few drops of the tincture poured upon the body of a large and vigorous rattle-snake, killed the reptile in a short time. An ointment made of the powdered leaves has been used with much success in tænia capitis, and some other cutaneous affections. (See *Bigelow's Medical Botany*)

The wood, being very hard, is very useful in smaller works. The Indians are said to make small dishes, spoons, and other domestic utensils out of the roots. these are large, of a soft texture, and easily wrought when green, but when dry become hard and smooth (*Curtis.*)

K. angustifolia is also reputed poisonous to sheep and cattle.
